A REPRINT

OF THE LAST (1880) EDINBURGH AND LONDON EDITION

OF CHAMBERS'S ENCYCLOPÆDIA,

With Copious Additions by American Editors.

FIFTEEN VOLUMES.

VOLUME II.

NEW YORK:
AMERICAN BOOK EXCHANGE,
764 BROADWAY
1881

AMERICAN PUBLISHER'S NOTICE.

THIS work, although based upon Chambers's Encyclopædia, whose distinguished merit is widely known, differs from it in important respects. It could scarcely be expected that an Encyclopædia, edited and published for a foreign market, would give as much prominence to American topics as American readers might desire. To supply these and other deficiencies the American Editors have inserted about 15,000 titles, arranging the whole, including Chambers's Supplement, in a single alphabet. The total number of titles is now about 40,000. The additions give greater fullness in the departments of biography, geography, history, natural history, and general and applied science. Scrupulous care has been taken not to mutilate or modify the original text of the edition of 1880; no changes have been made except such verbal alterations as are required by the omission of the wood-cuts. The titles of articles from Chambers's Encyclopædia, either from the main work or from the Supplement, are printed in bold-faced type—**AMERICA.** The titles of the American additions, whether of new topics or of enlargements of the old, are printed in plain capitals—AMERICA. Should it appear that an article from the English work and its American continuation disagree in any points, the reader will readily refer the conflicting statements to their proper sources.

The labor of consultation will be much reduced by the catch-words in bold-faced type at the top of the page, being the first and last titles of the pages which face each other; and by the full title-words on the back of the volume, being the first and last titles contained therein.

The word *ante* refers to Chambers's Encyclopædia, as represented in this issue. Whenever the word (*ante*) follows a title in the American additions, it indicates that the article is an enlargement of one under the same title in Chambers's Encyclopædia—usually to be found immediately preceding.

COPYRIGHT, 1880, BY
THE AMERICAN BOOK EXCHANGE.

AUDIPHONE, an instrument to assist the hearing. A thin rectangular sheet of substance resembling ebonite, provided with a handle, and having the semblance of a fan. When used as an A., the sheet is strained into a curve by strings which lead from the outer edge to the base of the handle. The outer edge is then placed against the upper teeth, and the sound-vibrations, gathered at the surface of the A., are communicated to the auditory nerve through the teeth and bones of the head. The A. may be used with artificial teeth, if they are well seated on the upper jaw.

AUDITOR (Lat. *audio*, I hear), the name given to certain officers appointed to examine accounts in behalf either of the government, of courts at law, of corporations, or of private persons. The term doubtless owes its origin to the old practice of delivering accounts *viva voce*.—AUDIT-OFFICE. In 1785, public auditors were appointed, under the title of "Commissioners for Auditing the Public Accounts," by 25 Geo. III. c. 52, by which the patents of lord Sondes and lord Mountstuart, as *auditors of the imprests*, were vacated, the sum of £7000 per annum being made payable to each of them for life, in lieu of a percentage which had been paid them on the amount of expenditure audited. Many subsequent statutes have been passed for the purpose of extending and defining the duties of these commissioners, and regulating the business of the audit-office. The commissioners of audit are empowered to call on all public accountants to account for moneys or stores intrusted to them; and, should they fail to do so, are required to certify their names to the remembrancer of the exchequer, and the attorney-general of England or Ireland, or the lord advocate of Scotland, in order that they may be proceeded against as defaulters. These proceedings, however, may be stayed for a time by the lords of the treasury, by whom the whole arrangements of the audit-office are controlled, on the application of the accused. The accounts of the ordnance, of the army and navy, and the land revenue, are now subjected to examination in the audit-office. By 2 Will. IV., c. 99, the powers and functions of the commissioners of public accounts in Ireland were transferred to the commissioners for Great Britain. The present establishment at the audit-office consists of a chairman, five commissioners, a secretary, and a large number of inspectors and examiners. The patronage is in the lords of the treasury.—AUDITOR OF THE COURT OF SESSION, in Scotland, is an officer whose duties consist in taxing the costs of suits in which expenses are found due, a remit being made to him for that purpose, either by a division of the court or a lord ordinary. The auditor returns a report to the judge or court making the remit, by whom decree is pronounced for the amount of the taxed account. Objections to the auditor's report may be stated to the judge or court. The nomination of the auditor is in the crown, the office being held *ad vitam aut culpam*. In the inferior courts an officer with corresponding powers is usually appointed by the court in which he officiates. The office of auditor of the court of session corresponds in many respects to that of the taxing-masters in the court of chancery. In Germany the name auditor is applied to junior legal functionaries.

AUDITOR (*ante*). The federal, state, and city governments elect or appoint auditors to supervise accounts. In the United States treasury department there are six, each having charge of a single branch of service. States and cities usually have one or more. An A. may be appointed by a court to state items and balances of accounts which are in question; he has authority to hear testimony, and in some states his reports are final as to questions of fact. Churches, benevolent, and other societies, usually have A.'s for inspection of financial accounts.

AUDITORY NERVE. By anatomists, the A. N. is associated with the facial, and is the seventh in order of origin from the brain, counting from before backwards. The seventh pair consists of the portio dura or facial, the portio mollis or auditory, and a small intermediate portion. The portio mollis apparently commences by some white streaks in the floor of the fourth ventricle; it then runs forward to the back of the petrous portion of the temporal bone, and enters the internal auditory meatus. The facial then leaves it to pass along the canal called the aqueductus fallopii, and the auditory divides into two portions, which diverge—the smaller one posterior for the semicircular canals and the vestibule, the other for the cochlea. Those entering the semicircular canals

divide into five branches, forming at last a nervous expansion somewhat analogous to the retina.

Several theories have been held at different periods with regard to the manner in which the nerves terminate in the cochlea, and how sound is transmitted from the latter to the brain. The latest, and that which is at present entertained by most physiologists, is that of M. Schultze. It has been shown, by actual experiment, that when a nerve in connection with a muscle is acted upon by a succession of very rapid strokes from the little hammer of a tetanmotor, and, when the strokes have arrived at a certain number in the second, a stimulus is sent along the nerve exciting the muscle to action. It is in the same way that M. Schultze supposes the impression of sound to be propagated to the nerves of the cochlea, by means of a series of little tetanmotors called the teeth of Corti, who discovered them. They are situated in the spiral lamina, which separates the spiral canal in the interior of the cochlea into an upper and a lower half or scala. The spiral lamina consists of an osseous septum, next to the central axis of the cochlea, and of a membranous layer, which prolongs the osseous septum to the outer wall of the cochlea, thus completing the spiral lamina. This membranous septum is double, and between its layers there is a chamber which contains the teeth of Corti, ranged side by side throughout the whole length of the spiral lamina, and gradually getting shorter from base to apex, like the strings of a harp or pianoforte. The chamber is filled up by a tremulous jelly-like fluid. The diagram, fig. 1, represents a perpendicular section of the spiral lamina. When the waves or vibrations of sound strike against the bones of the head, those bones are caused to vibrate; this vibration is transmitted through the head to the bones of the cochlea, which in turn set in motion the tremulous jelly which fills up the membranous chamber, *c*.

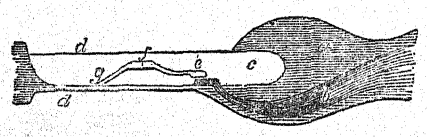

Fig. 1.

a, the osseous septum grooved for the passage of the cochlear nerve *b*, which terminates by a free end inside the chamber *c*, along the floor of which it lies for a short distance; *d*, *d*, are the two layers of the membranous septum. Lying in contact with the end of the nerve is the enlarged extremity of a rod *e*, which is connected in a flail-like manner by the hinge *f* to another rod, which is fixed at *g*.

AUDLEY, Sir JAMES, one of the original knights of the order of the Garter, founded in 1344 by Edward III., on his return from France after the victory of Cressy, was frequently in personal attendance on Edward the Black Prince, whom he accompanied to France in 1346. He was so conspicuously brave at the battle of Poictiers that the prince retained him as his own knight, and declared him to be the bravest soldier on his side. He conferred on him an annual revenue of 500 marks, which A. immediately gave up to his squires. This act of disinterestedness becoming known, the Black Prince conferred a further annual sum of 600 marks upon him. A. also accompanied the Black Prince into Spain, and in 1369 the office of seneschal of Poitou was conferred upon him. He took part in the capture of La-Roche-sur-Yon in Poitou, in the same year, and d. a few months after. The prince attended his funeral obsequies at Poictiers.

AUDLEY, THOMAS, lord Audley of Waldon, 1488–1544; an English lord chancellor. He was chosen speaker of the commons in the Long parliament in 1529; in 1532, he was made a knight and successor of Sir Thomas More as keeper of the great seal. In 1533, Henry VIII. made him lord chancellor, in which capacity he presided at the trial of More and others. When the confiscated church lands were parceled out, A. got Christ church in London with all its real estate, together with the great abbey of Walden, in Essex, which he made into a residence for himself. He gave lands to the support of what was then Buckingham college, Oxford, which was incorporated after the gift under the name of St. Mary Magdalen's college.

AUDOUIN, JEAN VICTOR, 1797–1841; an entomologist, native of Paris. With Dumas and Brongniart, in 1824, he began the *Annals of Natural Science*. He was professor of entomology in the museum, and a physician, in 1826. He was the founder and first president of the entomological society, and in 1838 a member of the academy. He investigated, at the request of the government, the injuries done to vine and silk culture by insects, and contributed a great number of reports and papers on his favorite subject, and, with others, wrote a work on the insects injurious to vineyards, etc.

AUDRAIN', a co. in n.e. Missouri, intersected by the St. Louis, Kansas City and Northern, and a branch of the Chicago and Alton railroads; 675 sq.m.; pop. '80. 19,760 It is a grazing and agricultural region, generally level and fertile. Beds of coal have been found. Co. seat, Mexico.

AUDRAN, GÉRARD, one of the most celebrated engravers of the French school, was b. at Lyon in 1640. He belonged to a family distinguished for its excellence in this department of art. After a three years' residence at Rome, where he studied under Carlo Maratti, and acquired a high reputation by his engraving of pope Clement IX., he was recalled to France by Colbert, and was appointed engraver to his majesty Louis XIV. Here he engraved the principal works of Lebrun, with whom he lived on terms of the closest friendship. His masterpieces are a series of engravings illustrating the battles of Alexander. He d. at Paris, 1703.

AU'DUBON, a co. in s.w. Iowa; 630 sq.m.; pop. '75, 2370. Agriculture is the leading interest. Co. seat, Exira.

AU'DUBON, JOHN JAMES, a distinguished American ornithologist, was b. in Louisiana, United States, in May, 1780, where his parents, who were both French, had settled on a plantation. His father, who was himself an ardent lover of nature, early directed his son's attention to natural objects. The youth conceived a passion for the study of birds; and a book of ornithological specimens determined him to become a draughtsman. About the age of 14, he went to Paris, and studied for some time under the celebrated David. In 1798, he was settled on a farm in Pennsylvania by his father, but he did not distinguish himself as an agriculturist. In 1810 he sailed down the Ohio with his wife and child, on a bird-sketching expedition. The following year, he visited Florida for a like purpose; and for many years after he continued his ornithological researches among the American woods; to the neglect of his ordinary business. The latter he finally abandoned; and in 1824 he went to Philadelphia, where he was introduced to prince Charles Lucien Bonaparte, who so warmly encouraged him in his plans that he determined on publication. After two years' further exploration of the forests of his native country, he came to Europe with the view to secure subscribers for his work on *The Birds of America*. He met with a warm reception from such men as Herschel, Cuvier, Humboldt, Brewster, Wilson, and Sir Walter Scott. The issue of his work was commenced shortly after, each bird being delineated life-size. The colored engravings were chiefly executed by the late Mr. W. H. Lizars of Edinburgh. The work was completed in 87 parts, elephant folio, containing 448 plates. While the work was in process of publication in this country (it was finished in 1839), A. revisited America three times, in order to make further researches. In 1831, he began the publication of his *American Ornithological Biography* in Edinburgh, which was also completed in 1839. In 1839, A. finally returned to America, where, in 1844, he published a reduced edition of his works. Assisted by Dr. Buchanan, he also published *The Quadrupeds of America*, and a *Biography of American Quadrupeds*. He d. Jan. 27, 1851, in his 71st year.

AUENBRUG'GER, or AVENBRUG'GER, VON AU'ENBRUG, LEOPOLD, 1722–1809; an Austrian physician who discovered the mode of investigating diseases of the chest and abdomen by auscultation. He applied his ear to the chest, and noted the sounds that followed a smart blow of his hand on the patient. His treatise on the subject attracted little attention until it was translated and illustrated by Corvisant, in 1808, when it quickly led the way to Laennec's improvement, whereby the ear is aided by the stethoscope. The great value of A.'s discovery has long been universally admitted.

AU'ER, ALOIS, was b. May 11, 1813, at Wels, in upper Austria, and was trained in a printing establishment of his native town to be a compositor, corrector, and manager. During his scanty leisure moments, A. employed himself in acquiring a knowledge of French, Italian, English, and other languages, in which he underwent an examination in 1835 and 1836, before the university of Vienna. His brilliant appearance on this occasion opened up to his ambition the probability of a professorial chair. In Oct., 1837, he was appointed professor of Italian in the college of Linz, in upper Austria. Here he labored assiduously in public and private teaching, and published a variety of useful school-books, on a system peculiar to himself. In 1839 he set out on his travels through Germany, Switzerland, France, and England, collecting materials for his favorite art. From 1841 to 1868, he was director of the national printing-office at Vienna. In 1847 he was elected member of the academy of sciences. He made known a photographic discovery, "spontaneous impression," in *Die Entdeckung des Naturselbstdrucker* (1864). He d. in 1869. A. published the *Sprachalle, or Lord's Prayer, in* 603 *languages*, with Roman types (1844); and the *Lord's Prayer in* 200 *languages*, with their national alphabets (1847). See NATURE-PRINTING.

AU'ERBACH, BERTHOLD, a popular German author, of Jewish extraction, was b. at Nordstetten, in the Würtemberg Black Forest, Feb. 28, 1812. He received his education at Carlsruhe, Stuttgart, Tübingen, Munich, and Heidelberg. Having at an early period abandoned the study of Jewish theology, he devoted his attention to literature. His first publications, *Judaism and Modern Literature* (Stuttg. 1836), and a translation of the works of Spinoza, with a critical life of his author (5 vols. Stuttg. 1841), had a philosophical tendency. In his *Educated Citizen* (Carlsruhe, 1842), and *Village Tales of the Black Forest* (1843), he applied himself to the portraiture of real life, and succeeded well. The *Village Tales* were translated into English, Swedish, and Dutch, and were generally admired. Among his other works are *Schrift und Volk* (1846); *Das Landhaus am Rhein* (1869); *Wieder unser; Gedenkblätter zur Geschichte dieser Tage* (1871); *Waldfried* (1874), etc.

AU'ERBACH, HEINRICH (real name STROMER), 1482–1543; a Bavarian physician and friend of Luther. He erected a large building in Leipsic in 1530 which is still known as the Auerbachshof, in which is a cellar where the great reformer drank, and out of which, as the people believed, Faust, the magician, rode upon a barrel, an event kept in memory by a painting on the wall of the cellar.

AU'ERSPERG, ADOLPH WILHELM DANIEL, Prince, b. 1821; son of prince Wilhelm Auersperg; served as a major of dragoons; in 1867, a member of the Bohemian diet, and

president of the assembly; in 1869, member of the upper chamber of the Austrian Reichstag; in 1871, succeeded Benet as the head of the Austrian ministry. He was in the same office in 1879.

AU'ERSPERG, ANTON ALEXANDER, Count von, 1806–76; an Austrian statesman and poet, more widely known by the *nom de plume* "Anastasius Grun." He belonged to an old Suabian family which obtained large estates in Carniola. After studying law and philosophy in Vienna and Gratz he traveled over Europe and England, and in 1829 married the countess Maria von Attems. He was offered official position but refused, as he was a prominent liberal and a strong opponent of Metternich and his policy. He wrote verses while a student, and in 1830 published a small volume, and also a semi-political romance. The next year his political reviews appeared and made a great sensation, exciting the government to detect the writer, who was fined 50 ducats. In 1835, he issued another collection of patriotic verses, and in 1837 collected his earlier writings into one volume, of which nearly 20 editions have been published. In 1848, he was chosen to the German "Vorparliament," and soon afterwards to the Frankfort national assembly, where he was on the "left center." He left in disgust before the year ended, in consequence of the murders of Auerswald and Lychnowski. In 1859, he returned to public life, but in 1861 was made a life-member of the Austrian Hevrenhaus, where he was the author of addresses to the throne. In the diet of Carniola and Styria he was a liberal and the supporter of German ideas. In 1868, he was elected president of the delegates of the Austrian crown lands, but, except the seat in the Hevrenhaus, he resigned all official positions. Some of his speeches, especially those in the confessional debates of 1868 and 1874, have attained great popularity. *Robin Hood* (in German) was his last poetical work of consequence.

AU'ERSPERG, CARLOS, Prince, b. 1814; an Austrian statesman, member of one of the oldest families of the empire. On the re-establishment of constitutional government, in 1861, he was made president of the upper chamber of the Reichsrath; and as representative of the Bohemian landed nobility in the diet of Prague, he has taken a conspicuous part in the defense of the constitutional system against clerical and feudal reaction, and in establishing the unity of the empire against federation. He was a zealous supporter of the liberal cabinet, at the head of which was his brother Adolph.

AU'ERSTÄDT, a village in Saxony, 10 m. w. of Naumburg, where Davoust won a great victory over the Prussians under the duke of Brunswick on the day (Oct. 14, 1806) that Napoleon defeated their main army at Jena. Napoleon made Davoust duke of A.

AU'GEAS, or AU'GEIAS, according to one account, the son of Helios and Iphiboe, but according to others, of Phorbas and Hermione, was king of Elis, and renowned for his wealth in oxen, of which he fed 3000 head in his stables. When the dung of these animals had been allowed to accumulate for many years, Hercules was commissioned by Eurystheus to cleanse the Augean stables in one day, and was promised as payment a tenth part of the oxen. Hercules accomplished the task by turning the courses of the rivers Peneus and Alpheus through the masses of ordure. When A. refused to pay the stipulated wages, a war ensued, and A. was slain by Hercules. The fable of the Augean stables often serves as an allusion in declamations on political corruptions, etc.

AUGEREAU, PIERRE FRANÇOIS CHARLES, duke of Castiglione, marshal and peer of France, one of the most brilliant and intrepid of that band of general officers whom Napoleon gathered around himself, was the son of a tradesman, and was b. 21st Oct., 1757. After serving some time in the French carabineers, into which he enlisted at the age of 17, he entered the Neapolitan service, in which he remained until 1787, when he settled in Naples as a fencing-master. With other French residents, he was banished from that city in 1792, and immediately volunteered into the French revolutionary army intended for the repulsion of the Spaniards. His services were so conspicuous, that in less than three years he was made general of a division. In 1795 he accompanied the army to Italy, where he greatly distinguished himself, especially in the field, but also in the council. He took an active part and gained much glory in the battles of Millesimo, Ceva, Lodi, Castiglione (for which he received his title), Roveredo, Bassano, etc. In 1797, he was appointed to the command of the army of the Rhine; but in a few months after, the directory not liking the spirit he displayed there, made him commander of the 10th division at Perpignan. This post he resigned in 1799, when he was elected as deputy into the council of the five hundred. In 1801 he received the command of the army in Holland, and was active in several engagements. In 1804 he was made a marshal; and in the following year he commanded a division of the army which reduced the Vorarlberg; and was afterwards engaged at Wetzlar, Jena, Eylau; also in Italy (1809); Spain (1810); Berlin, Bavaria, and Saxony (1813). He d. June 11, 1816.

AUGER, FLEXIBLE, an invention which permits great freedom in the direction of a boring tool. Its shaft is a closely coiled, flexible, steel spiral, fitted at one end with a sheave or pulley, and at the other with a suitable jaw for holding a bit. This shaft turns within a flexible tube, lined with spiral wire. Motion is communicated to the pulley by a cord, or belt, from some fixed machinery, and the belt is kept strained by a

counter-rope which is tied to some firm support. Augers are used varying from three eighths of an inch to an inch in diameter. The larger requires an inch driving cord.

AUGIER, GUILLAUME VICTOR ÉMILE, a French dramatist of considerable reputation, was b. at Valence, on the 17th of Sept., 1820, and was educated for the profession of an advocate. He soon, however, showed a predilection for letters, especially the drama. In 1844, he composed a piece in two acts, and in verse, entitled *La Ciguë*, which he offered to the Théâtre Français, but without success. The Odéon, however, received it, and it was played at that theater with considerable applause for nearly three months. This, while it is the first, is said to be likewise the best of A.'s works, containing some excellent moral lessons, set in a frame-work of the antique, and made attractive by elegant versification. In the following year, the Théâtre Français sought his services, and he produced for that theater his second comedy, entitled *Un Homme de Bien*, in three acts, and in verse. This was a comedy of the day, and was only partially successful. A third, *L'Aventurière*, which appeared in 1848, was better received; still there was said to be too much of commonplace in the moral sentiments with which it abounded. *Gabrielle*, in five acts, and in verse, which appeared in 1849, was also a highly moral piece, and gained for its author the Monthyon prize. In 1852, A. wrote a drama, entitled *Diane*, in which Rachel took the principal part, but in spite of all her efforts it proved a failure. He was more fortunate with *La Pierre de Touche*, a prose comedy in five acts, written in partnership with Jules Sandeau, and produced in 1853. In the same year he wrote a verse-comedy, in three acts, entitled *Philiberte*, said to be a charming *genre* piece, in which the grace of the details supplies the absence of intrigue. His subsequent pieces, however, belong all more or less to the comedy of intrigue. Such are *Le Mariage d'Olympe; Le Gendre de M. Poirier*, written in partnership with Jules Sandeau; and *La Revanche de Georges Dandin*—all produced in 1855; *La Jeunesse*, in 1858; *Les Lionnes Pauvres*, in the same year, written in conjunction with E. Foussier; and the *Beau Mariage*, also in conjunction with Foussier, in 1859. Either singly or with others, M. A. has also written *Les Effrontés, Le Fils de Giboyer, Maître Guérin, La Contagion, La Chasse au Roman, L'Habit Vert, Paul Forestier*, and *Sapho*—the last mentioned an opera, the music by Gounod. In 1856, he published a small volume of *Poésies*, some of which are very elegant both in thought and expression. Usually, A. is regarded as one of the leaders of the school of good sense; in his later pieces, however, approaching too much to the manner of the younger Dumas. In 1858, M. A. was elected a member of the Académie Française, and in the same year was promoted to the rank of officer in the *légion d'honneur*, of which he became a commander in 1868.

AU'GITE (from Gr. *augé*, brilliancy), or PY'ROXENE (from Gr. *pyr*, fire, and *xenos*, a guest), a mineral very nearly allied to hornblende (q.v.), which has, indeed, by some mineralogists been regarded as a variety of it, although the distinction between them is undeniably important, as characterizing two distinct series of igneous rocks. A. consists of 47 to 56 per cent of silica, 20 to 25 per cent of lime, and 12 to 19 per cent of magnesia, the magnesia sometimes giving place in whole or in part to protoxide of iron, and some varieties containing a little alumina, or a little protoxide of manganese. Its specific gravity is 3.195 to 3.525. It is little affected by acids, or not at all. It is usually of a greenish color, often nearly black. It crystallizes in six or eight-sided prisms variously modified; it often occurs in crystals, sometimes imbedded, often in grains or scales. It is an essential component of many igneous rocks, particularly of basalt (q.v.), dolerite, and A. porphyry (see PORPHYRY), from which chiefly it derives its importance as a mineral species. A. rock, consisting essentially of A. alone, occurs in the Pyrenees. A. is a common mineral in the trap-rocks of Britain and other countries. It is rarely associated with quartz, in which respect it differs from hornblende, but very often with labradorite, olivine, and leucite. Fluorine, which is generally present in small quantity in hornblende, has never been detected in A. The form of the crystals is also different in the two minerals, as well as their cleavage; but prof. Gustav Rose of Berlin has endeavored to show that the difference between A. and hornblende arises only from the different circumstances in which crystallization has taken place, and that A. is the production of a comparatively rapid, and hornblende of a comparatively slow cooling. He regards some of the varieties as intermediate. His views have been supported by experiments, and by a comparison of A. with certain crystalline substances occurring among the scoriæ of foundries.—*Diopside, sahlite*, and *coccolite* are varieties of A.—*Diallage* (q.v.) and *hypersthene* (q.v.) are very nearly allied to it.

AU'GLAIZE, a co. in w. Ohio, intersected by the Dayton and Michigan and the Lake Erie and Louisville railroads; 399 sq.m.; pop. '80, 25,443. The Miami canal passes through, and it is drained by A. river. Surface level, well wooded, and soil fertile. Co. seat, Wapakoneta.

AUGMENTATION, in heraldry. See HERALDRY.

AUGMENTATION, in music, is the reproduction of a melody, or principal subject of a composition, in the course of the progress of the piece, in notes of greater length than those notes in which the melody is first introduced. The tempo remains unaltered. A. is of great importance in the treatment of the subjects, or themes, for fugues, and, when cleverly used, produces great effects.

AUGMENTATION, PROCESS OF, in Scotch law, is an action in the court of teinds (q.v.) by the minister of a parish against the titular, or beneficiary, and heritors, for the purpose of procuring an increase to his stipend. The moderator and clerk of the presbytery to which the minister belongs must also be called as parties. By 48 Geo. III. c. 138, it is enacted that no A. shall be granted till the expiration of 15 years from any A. previous to the act, nor till the expiration of 20 years from any A. subsequent to the act. A period of 20 years must thus elapse between each augmentation. The amount of the A. is fixed, or modified, as it is termed, in grain or victual; the stipend itself being paid in money, according to the fiars' prices (q.v.) of each year. In addition to the ascertainment or modification of a suitable stipend, regard being had to the state of the teinds, the extent of the parish, the expense of living, and the like—a process of A. has the further object in view of *locating* the stipend so modified—i.e., of assigning it in due proportions to the heritors or other parties in possession of the tithes. This latter object is attended by means of what is called a scheme of locality—i.e., an allotment of the stipend modified to the several parties liable therefor. This scheme is prepared at the instance of the second junior lord ordinary (q.v.), on a remit from the teind court. The last conclusion in a summons of A. is for a suitable sum, or increase to the sum already allowed, for communion elements—i.e., for bread, wine, and other necessaries for celebrating the sacrament of the Lord's supper after the Presbyterian fashion. When there is not a sufficient amount of teind to bring the stipend of the minister up to £150 per annum, with £8 6s. 8*d.* for communion elements, it is provided by 50 Geo. III. c. 84, and 5 Geo. IV. c. 72, that the residue shall be paid by the exchequer. In addition to their stipend, ministers have right to a manse and glebe, or a provision of £50 annually in lieu of them. See STIPEND, GLEBE, MANSE; see also PARLIAMENTARY CHURCH.

AUGS'BURG, historically one of the most notable cities in Germany, is situated in the angle between the rivers Wertach and Lech, and is the chief city of the circle of Swabia and Neuburg, in Bavaria. The pop. is (1875) 57,210. Though presenting an antique and rather deserted appearance, A. has numerous fine buildings, and especially one noble street, the "imperial" Maximilian Strasse, adorned with bronze fountains. The industry of A. is reviving; several cotton and woolen factories are in operation, as well as manufactories of paper, tobacco, and machinery. Its gold and silver wares still retain their ancient reputation. The art of copper engraving is extinct; but printing, lithography, and bookselling have taken a new start. The *Allgemeine Zeitung*, the most widely circulated paper in Germany, is published here. In 1870, there were 10 printing establishments and 34 book-shops. There are 74 breweries. Banking and stock-jobbing are extensively carried on; and it is still the emporium of the trade with Italy and southern Germany. It is the center of a system of railways connecting it with Nürnberg and Leipsic, with Switzerland, Munich, etc. The foundation of A. was the "colony" planted by the emperor Augustus, 12 B.C., after the conquest of the Vindelici, probably on the site of a former residence of that people. It was called *Augusta Vindelicorum*, and hence the present name. It became the capital of the province of Rhætia, was laid waste by the Huns in the 5th c., and came next under the dominion of the Frankish kings. In the war of Charlemagne with Thassilo of Bavaria, it was again destroyed. After the division of Charlemagne's empire, it came under the duke of Swabia; but having become already rich by commerce, was able to purchase gradually many privileges, and finally became, in 1276, a free city of the empire. It now rose to greater consequence than ever, and had reached the summit of its prosperity by the end of the 14th century. About this time (1368), its aristocratic government was set aside for a democratic, which lasted for 170 years, till the aristocracy, favored by Charles V., regained the ascendency. A. continued in great eminence for its commerce, manufactures, and art, till the war between Charles V. and the Protestant league of Schmalkald (1540). Along with Nürnberg it formed the emporium of the trade between northern Europe and the south, and its merchants were princes whose ships were in all seas. See FUGGER. It was also the center of German art as represented by the Holbeins, Burkmair, Altdorfer, and others. Many diets of the empire were held in A., and the leading events of the reformation are associated with its name. The discovery of the road to India by the cape, and of America, turned the commerce of the world into new channels, and dried up the sources of A.'s prosperity. It lost its freedom with the abolition of the German empire in 1806, and was taken possession of by Bavaria.

AUGS'BURG CONFESSION, the chief standard of faith in the Lutheran church. Its history is the following. With a view to an amicable arrangement of the religious split that had existed in Germany since 1517, Charles V., as protector of the church, had convoked a diet of the empire, to meet at Augsburg, 8th April, 1530, and had required from the Protestants a short statement of the doctrines in which they departed from the Catholic church. The elector, John, of Saxony, therefore, in Mar., called on his Wittenberg theologians, with Luther at their head, to draw up articles of faith, to lay before him at Torgau. The commissioned doctors took as a basis, in so far as pure doctrine was concerned, articles that had been agreed to the previous year at conferences held at Marburg and Schwabach, in the form of resolutions of the Lutheran reformers of Germany against the doctrines of Zwingli. These doctrinal articles supplemented, and with a practical part newly added, were laid before the elector at Torgau. Mel-

anchthon then, taking the Torgau articles as a foundation, began in Augsburg, in May, and with the advice of various Protestant theologians, as well as princes and other secular authorities, composed the document, which he first called an apology, but which in the diet itself took the name of the A. C. Luther was not present in Augsburg, being then under the ban of the empire, but his advice was had recourse to in its composition. The Torgau articles were in German; the confession was both in German and Latin; and Melanchthon labored incessantly at its improvement till it was presented to the emperor, June 25. The character of Melanchthon, in the absence of Luther, had led him, in setting about the composition of the document, to aim at maintaining a spirit of love, forbearance, and mediation, as well as the utmost brevity and simplicity. Its object, which only became gradually apparent after the meeting of the diet, was, in the first place, to give a collected view of the belief of the Lutheran Protestants, aiming at the same time at refuting the calumnies of the Catholics, and at laying a foundation for measures of reconciliation.

The first part of the confession contains 21 articles of faith and doctrine: 1. Of God; 2. Of original sin; 3. Of the Son of God; 4. Of justification; 5. Of preaching; 6. Of new obedience; 7 and 8. Of the church; 9. Of baptism; 10. Of the Lord's supper; 11. Of confession; 12. Of penance; 13. Of the use of sacraments; 14. Of church government; 15. Of church order; 16. Of secular government; 17. Of Christ's second coming to judgment; 18. Of free will; 19. Of the cause of sin; 20. Of faith and good works; 21. Of the worship of saints. The second and more practical part, which is carried out at greater length, contains seven articles on disputed points: 22. On the two kinds of the sacrament; 23. Of the marriage of priests; 24. Of the mass; 25. Of confession; 26. Of distinctions of meat; 27. Of conventual vows; 28. Of the authority of bishops.

This document, signed by some six Protestant princes and two free cities, was read before the emperor and the diet, 25th June, 1530. Melanchthon, not looking upon the confession as binding, began shortly after to make some alterations in its expression; at last, in 1540, he published a Latin edition (*Confessio Variata*) in which there were important changes and additions. This was especially the case with the article on the Lord's supper, in which, with a view to conciliation, he endeavored to unite the views of the Lutherans and Calvinists. This gave rise subsequently to much controversy; orthodox Lutheranism repudiated the alterations of Melanchthon, and long continued to subject his memory to great abuse; though it is clear that Melanchthon and his adherents contemplated no substantial departure in doctrine from the original confession. It is not certain that the form of the confession found in the Lutheran standards is identical with the unaltered A. C., as the two original documents—German and Latin—laid before the diet have been lost. The chief distinction between the orthodox Lutherans and the reformed churches of Germany has all along been adherence to the "unaltered" or to the "altered" confession. It was even a matter of controversy whether the "reformed" were entitled to the rights secured to the Protestants by the religious peace of Augsburg, concluded in 1555, on the ground of the "unaltered" confession.—Though the A. C. is still formally adhered to by the Protestant churches of Germany, it is confessedly no longer the expression of the belief of the vast majority of the members, after the great advances made by theology, and the many alterations in public opinion and feeling.

AUGSBURG INTERIM. See INTERIM.

AUGUR, CHRISTOPHER C., b. 1821; a graduate of West Point and brigadier-general in the U. S. army; served in the war with Mexico, and in various Indian skirmishes. In the civil war he was major-general of volunteers, and was wounded at Cedar mountain. At the close of the war he was brevetted major-general of the regular army.

AUGUR, HEZEKIAH, 1791–1858; an American artist. His best work is the statue of "Jephtha and his Daughter" in the Trumbull gallery of Yale college: but what gave him greater fame was the invention of a machine for carving, which is now in general use.

AUGURIES and **AUSPICES.** These terms are familiar to every reader of Roman history, and are, besides, so frequently employed in English in a secondary and metaphorical sense, that a vague notion of their original meaning is caught up even by those who know nothing of classical antiquities. As, however, the entire religious and political life of the early Romans was deeply penetrated by the influence of their sacred superstitions, and as amongst these auguries and auspices held a prominent place, a clear conception of what they were is a matter of considerable moment. The following statements exhibit, in a condensed form, the substance of what is known on the subject.

Like almost all primitive nations, the Romans believed that every unusual occurrence had a supernatural significance, and contained, hidden in it, the will of heaven regarding men. To reveal or interpret this hidden will, was the exclusive privilege of the augur, who apparently derived his official designation, in part at least, from *avis*, a bird; while Roman history abundantly proves that the observation of the flight of birds was a principal means adopted for discovering the purpose of the gods. It was not, however, any one who could be appointed an augur. The gods selected their own interpreters—that is to say, they conferred the divine gift upon them from their very birth; but an educational discipline was also considered necessary, and hence a "college of

augurs" figures in the very dawn of Roman history. Romulus, it is almost certain, was an augur himself. He is said to have been skilled in the art of divination from his youth; and by "divination" we must specially understand augury; for the Romans, with patriotic piety, held all the forms of divination practiced in other countries to be useless and profane. Previous to the Ogulnian law, passed in the year 307 B.C., there were only four augurs, who were selected from the patricians. By this law, however, the plebeians became eligible for the pontifical or augural offices, and five were immediately created. For more than 200 years, the number continued the same, till Sulla, in 81 B.C., increased it to fifteen. Finally, in the first days of the empire, when all parties, sick of the long civil wars, hurried to throw their privileges at the feet of the monarch who had brought peace into their homes, the right of electing augurs at his pleasure was conferred on Augustus, after which the number became indefinite.

At first the augurs were elected by the *comitia curiata;* but as the sanction of the former was necessary to give validity to the acts of the latter, they could always "veto" any elections which were obnoxious to them; so that the power of electing members to fill up vacancies naturally fell into the hands of the college itself, and so continued till 103 B.C., when a tribune of the people named Ahenobarbus carried a law by which it was enacted that for the future, vacancies in the augural and pontifical offices should not be filled up by those religious corporations themselves, but by a majority of certain picked tribes. This new law was occasionally repealed and re-enacted during the civil wars which lasted till the time of Augustus. The scramble for power, however, during these political vicissitudes, as well as the general advance of knowledge, had rendered its prophetic pretensions ridiculous in the eyes of educated people. By Cicero's time, it had lost its religious character altogether, but was still regarded as one of the highest political dignities, and coveted for the power it conferred.

The modes of divination employed by the augurs were five in number—*augurium ex cœlo, ex avibus, ex tripudiis, ex quadrupedibus, ex diris.* The *first,* related to the interpretation of the celestial phenomena, such as thunder and lightning, was apparently of Etruscan origin, and held to be of supreme significance. The *second* related to the interpretation of the noise and flight of birds. It was not every bird, however, that could be a sure messenger of the gods. Generally speaking, those "consulted," as it was called, were the eagle, vulture, crow, raven, owl, and hen. The first two belonged to the class of *alites,* or birds whose *flight* revealed the will of the gods; the last four to the class of *oscines,* whose voice divulged the same. These two modes of augury were the oldest and most important. Of the other three, the auguries *ex tripudiis* were taken from the feeding of chickens; the auguries *ex quadrupedibus,* from four-footed animals —as, for instance, if a dog, or wolf, or hare ran across the path of a Roman, and startled him by any unusual motion, he mentioned it to an augur, who was expected to be able to advise him what to do; the auguries *ex diris* (a vague kind of augury), from any trifling accidents or occurrences not included in the previous four—such as sneezing, stumbling, spilling salt on the table, etc.

At Rome, the auspices were taken on the summit of the Capitoline hill; and the ground on which the augur stood was solemnly set apart for the purpose. The latter then took a wand, and marked out a portion of the heavens in which his observations were to be made. This imaginary portion was called a *templum* (hence *contemplari,* to contemplate), and was subdivided into right and left. According as the birds appeared in either of these divisions were the auspices favorable or unfavorable. How vast the political influence and authority of the augurs must have been is seen from the fact that almost nothing of any consequence could take place without their sanction and approval. The election of every important ruler, king, consul, dictator, or prætor, every civic officer, every religious functionary, was invalid if the auspices were unfavorable. No general could lawfully engage in battle—no public land could be allotted—no marriage or adoption, at least among the patricians, was held valid—unless the auspices were first taken, while the comitia of the centuries could be dispersed at a moment's notice by the veto of any member of the augural college.

We have employed the two terms, auguries and auspices, as synonymous. But a slight difference is perceptible between them: not the augurs only, but the chief magistrates of Rome (inheriting the honor from Romulus), held the "auspices," while the "auguries" were exclusively in the possession of the former; but the mode of divination, and the end to be obtained by it, seem to have been the same in both cases.

The power of taking the auspices in war was confined to the commander-in-chief; and any victory gained by a legate was said to be won under the auspices of his superior, and the latter alone was entitled to a triumph. Hence has originated the very common phrase in our language, "under the auspices" of some one, which usually denotes nothing more than that the person alluded to merely lends the influence of his name.

AUGUST, the sixth month in the Roman year, which began with Mar. was originally styled *Sextilis,* and received its present name from the emperor Augustus, on account of several of the most fortunate events of his life having occurred during this month. On this month he was first admitted to the consulate, and thrice entered the city in triumph. On the same month, the legions from the Janiculum placed themselves under his auspices, Egypt was brought under the authority of the Roman people, and an end put to the civil wars. (See Macrobius, i. 12.) As the fifth month, or *Quintilis,* had pre-

viously been styled Julius in honor of Julius Cæsar, a day was taken from Feb. to make A. equal with July.

AUGUSTA, the name of two considerable cities in the United States.—1. A. is the capital of Maine, situated on both banks of the river Kennebec, which is here crossed by a bridge 520 ft. long. Its lat. is 44° 19′ n., and long. 69° 50′ w. Up to A. the river is navigable for sloops from its mouth, a distance of 43 m., in a straight line; while a dam, constructed immediately above the city, enables steamboats to ply more than 20 m. above, as far as Waterville. A. is also a station on the railway between Portland and Bangor. The dam, too, which improves the navigation, has created a vast water-power, which is extensively employed for manufacturing purposes. Between 1830 and 1870, the pop. had increased from 3980 to 7808.—2. A. is the second city in Georgia, on the Savannah, 231 m. from its mouth. Its lat. is 33° 28′ n., and long. 81° 54′ w. It has extensive railway communication; and a canal, from a point 9 m. up, brings the waters of the Savannah to the city on such a level as to furnish a fall of 35 or 40 ft.—a water-power which is extensively and profitably employed. It is spacious and regular in its plan—Greene street, for instance, being 168 ft. broad. The chief buildings are the city hall, a masonic hall, an odd-fellows' hall, the Richmond academy, the Georgia medical college, the opera-house, and an orphan asylum. The city also possesses an arsenal, water-works, and numerous banks, factories—of which the chief is "Augusta factory," with 500 hands—foundries, flouring-mills, churches, hospitals, and newspapers. Of late years, the pop. has increased rapidly. In 1880, it was 22,301.

AUGUSTA, a co. of Virginia, in the valley of the Shenandoah; 900 sq.m.; pop. '70, 28,763—6737 colored; in '80, 35,500—7000 colored. It is watered by the branches of the Shenandoah and their tributaries, and by several small streams flowing into the James river. The elevation is considerable, including as it does the ridge dividing the waters of the Shenandoah from those of the James. The population is largely of Scotch-Irish descent, with an intermixture of the German element from Pennsylvania. The chief productions are beef, pork, mutton, wool, wheat, corn, rye, oats, barley, hay, and tobacco. The streams furnish an abundance of water power. Deposits of iron and magnesia are found in some places. Near Craigsville is an inexhaustible deposit of coral marble of fine quality, and in the eastern section anthracite coal is abundant. Mineral springs abound. The educational advantages of the county are of a superior kind.

AUGUSTA, JOHN, 1500–75; a German theologian. He studied at Würtemberg under Luther and Melanchthon, though he did not adopt all of the former's views. He was a minister among the Bohemian brethren, and subsequently the bishop of the sect. After the Schmalkalden war, all the sect were banished, and A. and other leaders arrested. He was offered freedom if he would make public recantation, but this he declined to do. In 1564 he was liberated, pledging himself not to teach or preach. He wrote an *Outline of the Doctrines of the Bohemian Brethren*, and two other religious works.

AUGUSTA, MARIA LOUISA CATHERINE, b. Sept. 30, 1811; queen of Prussia and empress of Germany, daughter of Charles Frederick, the grand duke of Saxe Weimar, by a daughter of Paul I. of Russia. She was brought up at the court of her grandfather, Charles Augustus, where she was intimate with Goethe. Her oldest sister married Charles, prince of Prussia, and she married his brother William, June 11, 1829. Her only children are the crown prince and the princess Louisa, whose education she herself personally superintended. The empress is a lover and patron of arts and letters, and is greatly beloved for benevolence, and for personal exertion for the relief of wounded soldiers in 1870–71, which work she supplemented in 1872 by founding a seminary for the education of the daughters of officers who fell in the war.

AUGUSTA HISTORIA, or AUGUSTAN HISTORY, the title of a collection of biographies of Roman emperors from Adrian to Carinuc. The memoirs are important for matters of fact, but the literary character is poor. The first edition was printed as early as 1475, at Milan. There is no English translation.

AUGUSTAN AGE, the literary period of Rome which was at its height in the reign of Augustus, during which such writers as Ovid, Horace, Cicero, Virgil, and Catullus flourished, with patrons of literature like Mecænas. At that age the language was in its perfection, and men of letters were held in high honor. The English A. A. was the period of Addison, Swift, Steele, and their compeers. In France such a period is assigned to the latter part of the reign of Louis XIV.

AUGUSTENBURG, a village of 800 inhabitants in the center of the island of Alsen. It is noted for being the residence of the duke of Holstein-Sonderburg-Augustenburg, for its splendid "stables," and for the castle belonging to the ducal family.

AUGUSTI, a learned German theologian, b. in 1772 at Eschenberga, near Gotha. He studied at Jena under the celebrated Griesbach, and afterwards devoted himself for some time to public teaching. In 1798, he became lecturer (*privat-docent*) in philosophy, and in 1800 he was appointed professor-extraordinary of the same. Three years after, he succeeded Ilgen in the chair of oriental literature; but his love of theological studies becoming predominant, he accepted the offer of a theological professorship in the university of Breslau, where he exerted a wide and beneficial influence. In 1819 he was

transferred to Bonn, and made a director of the consistory at Cologne. Other ecclesiastical honors were conferred on him during the course of his life. He d. on the 28th April, 1841.

In the early part of his career, A. was a decided rationalist; but subsequently he returned to orthodox Lutheranism, more, perhaps, from the conservative bias of his nature, than from any profound conviction of the truth of the national creed. The change, however, was not accompanied, as is usual in such cases, with any intense bigotry. A. remained to the last a liberal-hearted Christian. His writings, marked by great learning, industry, and spirit, are much esteemed by his countrymen. The most important is his *Manual of Christian Archæology* (Leip., 1836–37).

AUGUSTINE, AURELIUS ST., the greatest of the Latin fathers, was b. at Tagaste, a t. of Numidia, on the 13th of Nov., 354 A.D. His father, Patricius, was poor, but of good family, and filled the office of magistrate. He continued a pagan till advanced in years, and was only baptized shortly before his death. He does not seem to have been remarkable for any elevation of mind; on the contrary, one may fairly conclude, from his son's statements, that he was an irascible, kind-hearted man, more intent on his son's advancement in this world than in that which is to come. His temper often caused great sorrow to his gentle and pious wife, who loved him faithfully, however, and was therefore rewarded with the secret by which she could charm the evil spirit out of him. Patricius was very anxious that A. should become a fine scholar, as he noticed that not a few people in his day were obtaining large incomes by their "wits." A. was accordingly sent to school at Madaura, and subsequently to Carthage, to complete his studies. Previous to this, however, he had enjoyed the inestimable felicity of a religious education at home. His mother, Monnica, had been his best instructor. Neander truly says: "Whatever treasures of virtue and worth the life of faith, even of a soul not trained by scientific culture, can bestow, was set before him in the example of his pious mother."

The energy and penetration of intellect exhibited by the young A. excited the most flattering hopes. When he left home for Carthage, a joyous, ardent, and resolute student, a bright career of worldly prosperity seemed to open before him. But strong as A. was, the temptations of Carthage were stronger. His nature, deep, impetuous, and passionate, thirsted for excitement. He had just reached the age when happiness is conceived to be synonymous with pleasure, and Carthage, the second city of the empire, was rank as Rome in its sensual corruptions. A. fell. In his *Confessions*, he paints the frightful abyss into which he felt himself plunged; nor does he seek to excuse himself; on the contrary, the shadow of his guilt is thrown forward over all his boyish life, and he displays even a morbid zeal and acuteness in pointing out what others, less censorious, might term the frivolous errors of his childhood, but which seemed to A. the parents of his subsequent vices, and therefore equally bad and equally reprehensible. Before he had reached his 18th year, his mistress bore him a son, who was named Adeodatus—afterwards baptized along with him at Milan. The thing which appears to have first stirred his deeper being into life was a passage which he suddenly came across in the *Hortensius* of Cicero, treating of the worth and dignity of philosophy. To use the language of Neander: "The conflict now began in his soul which lasted through eleven years of his life. As the simplicity of the sacred Scriptures possessed no attractions for his taste—a taste formed by rhetorical studies and the artificial discipline of the declamatory schools—especially as his mind was now in the same tone and direction with that of the emperor Julian, when the latter was conducted to the Platonic theosophy; as, moreover, he found so many things in the doctrines of the church which, from want of inward experience, could not be otherwise than unintelligible to him, while he attempted to grasp, by the understanding from without, what can be understood only from the inner life, from the feeling of inward wants, and one's own inward experiences; so under these circumstances, the delusive pretensions of the Manichæan sect, which, instead of a blind belief on authority, held out the promise of clear knowledge and a satisfactory solution of all questions relating to things human and divine, presented the stronger attractions to his inexperienced youth." A. now became a professed Manichæan. Returning to his native town, he lectured for a short time on "grammar"—that is to say, on literature. Soon afterwards, he returned to Carthage, to pursue his profession under more favorable auspices. Here he wrote, in his 27th year, his first work, *De Apto et Pulchro*—a treatise on æsthetics, which has unfortunately been lost. About the same time his spiritual nature became keener and more imperative in its demands. The futile speculations of the visionary sect to which he had attached himself now became apparent. He had a series of interviews and conversations with Faustus, one of the most celebrated teachers of Manichæism; and these so utterly disappointed his expectations, that he left the society in disgust and sad bewilderment, after having wasted ten years in a fruitless search for wisdom and truth.

In 383 he went to Rome, followed by the tears, the prayers, and the anxieties of his excellent mother, who was not, however, bereaved of hope, for both her faith and her love were strong. After a short stay, A. left Rome, and proceeded to Milan, where he became a teacher of rhetoric. No change could have been more fortunate. At this time, the bishop of Milan was the eloquent and devout St. Ambrose. An intimacy sprang up between the two. A. often went to hear his friend preach. He was not, however, as yet a Christian. He had only emerged, as it were, from Manichæism

—the region of night-clouds and shadows—and was now gazing on the gray dawn of the Platonic philosophy, prophetic of the noontide splendors of Christianity which were soon to burst upon his vision. Still, A. did not afterwards despise this preliminary training; he was too great and honest a man for that. He confesses that the Platonic writings "enkindled in his mind an incredible ardor;" they awakened his deeper spiritual nature, which keenly upbraided him with his sins. Once more he studied the Bible, although from a purely Platonic point of view, and rather wishing to find in it "those truths which he had already made himself acquainted with from the Platonic philosophy, but presented in a different form." He began to think that Christ and Paul, by their glorious life and death, their divine morality, their great holiness, and manifold virtues, must have enjoyed much of that "highest wisdom" which the philosophers thought confined to themselves. For some time he clung to his Platonic Christianity, and shaped the doctrines of the Bible according to it; but when he found that it was weak to overcome temptations, and that "he himself was continually borne down by the ungodly impulses which he thought he had already subdued," the necessity of a living personal God and Savior to rescue him from the condemnation of his own conscience, and impart a sanctifying vitality to the abstract truths which he worshiped, shone clear through all the stormy struggles of his heart. In the eighth and ninth books of his *Confessions*, he has left a noble though painful picture of his inward life during this momentous crisis. It is sufficient to say that the spirit of God triumphed. On the 25th of April, 387 A.D., A. along with his natural son, Adeodatus, of whom he seems to have been justly fond, was baptized by Ambrose at Milan. Shortly after he set out on his return home. At Ostia, on the Tiber, his beloved mother, who had followed him to Milan, died; her eyes had seen the salvation of her son, and she could depart in peace. After her death, and before leaving Italy for Africa, A. wrote his treatises, *De Moribus Ecclesiæ Catholicæ et de Moribus Manichæorum; De Quantitate Animæ;* and *De Libero Arbitrio.* It is unnecessary to relate at any length the subsequent life of Augustine. His character and principles of action had become fixed, and he now brought the whole majesty of his intellect to bear upon the side of Christianity. Having, as was then customary for converts, divided his goods among the poor, he retired into private life, and composed several treatises—*De Genesi Contra Manichæos, De Musicâ, De Magistro,* and *De Verâ Religione,* which secured him a high reputation. In 391, he was ordained a priest by Valerius, bishop of Hippo; and during the next four years, though earnestly engaged in the work of preaching, contrived to write three different works. In 395, he was made colleague of Valerius. Then ensued a period of hot strife, known in church history as the Donatist and Pelagian controversies. A., as may naturally be supposed, having passed through so fierce a fire of personal experience on religious questions, would be very jealous both of what he *knew* to be the truth, and of what he only *thought* to be the truth. This, added to his acute and profound intellect, made him, in spite of the poverty of his historical erudition, a most formidable and relentless antagonist. But this portion of his career will fall to be treated more properly under Pelagius and Pelagianism (q.v.). In 397, appeared his *Confessions,* in 13 books. It is a deep, earnest, and sacred autobiography of one of the greatest intellects the world has seen. Passages of it have no parallel except in the Psalms of David. In 413, he commenced his *De Civitate Dei,* and finished it in 426. It is generally considered his most powerful work. Exception may be taken to much that it contains. The learning is no doubt very considerable, but it is not accurate. A. was an indifferent scholar: he had studied the Latin authors well; but of Greek "he knew little, and of Hebrew, nothing." Many of his reasonings are based on false and untenable premises, and he erred often in his etymological explanations; but in spite of these and other drawbacks, the final impression left on the mind is, that the work is one of the most profound and lasting monuments of human genius. In 428, A. published his *Retractationes,* in which he makes a recension of all his previous writings. It is a work of great candor. He frankly acknowledges such errors and mistakes as he had discovered himself to have committed, explains and modifies numerous statements, and modestly reviews his whole opinions. His end was now drawing nigh. In 429, the Vandals, under the barbarian Genseric, landed in Africa; next year they besieged Hippo. A., now in his 76th year, prayed that God would help his unhappy church, and grant himself a release out of this present evil world. He d. on the 28th of Aug., 430, in the third month of the siege.

No mind has exerted greater influence on the church than that of Augustine. Consistency of theological opinion is not to be looked for from him, nor from any of the church fathers. A larger sphere of freedom was permitted to religious speculation in those unfettered days, before creeds were encircled with that traditional sanctity they now possess. Nevertheless, we have little difficulty in determining the central tenets of his theological belief. He held the corruption of human nature through the fall of man, and the consequent slavery of the human will. Both on metaphysical and religious grounds, he asserted the doctrine of predestination, from which he necessarily deduced the corollary doctrines of election and reprobation; and finally, he strenuously supported, against the Pelagians, not only these opinions, but also the doctrine of the perseverance of the saints. At the same time, it is but fair to add that, even on such points, his language is far from uniform; that much of the severity of his doctrines arose from the

bitter and painful remembrance of his own early sins, and from the profound impression which the corrupt state of society in his time, and the vast desolations of barbarism, had made on his earnest and susceptible soul; and that, in his desire to give glory to God, he sometimes forgot to be just to man. In illustration of this may be mentioned the fact (see Neander, Mosheim, and Waddington's church histories) that the maxim which justified the chastisement of religious errors by civil penalties, even to burning, was established and confirmed by the authority of A., and thus transmitted to following ages. In his epistle to Dulcitius, a civil magistrate, who shrank from putting in force the edict of Honorius against heretics, he uses these words: "It is much better that some should perish by their own fires, than that the whole body should burn in the everlasting flames of Gehenna, through the desert of their impious dissension." In the opinion of Neander, it was to the somewhat narrow culture and the peculiar personal experience and temperament of Augustine, that the doctrines of absolute predestination and irresistible grace, first systematized by him, owed much of that harshness and one-sidedness which so long obstructed their general reception by the church, and which continue to render them repulsive to multitudes.

His life has been written by Tillemont, and his entire works have been repeatedly edited. The Benedictine edition, published at Paris in 11 vols. (1679–1700), is the best. Numerous editions of the *Confessiones* and *De Civitate Dei* have appeared; the most recent of the latter by Marcus Dods, D.D. In the "Library of Fathers of the Holy Catholic Church," are translations into English of A.'s *Confessions, Exposition on St. John's Gospel* and *on the Psalms, Sermons on the New Testament*, and *Short Treatises*. His *Sermon on the Mount* is translated by Trench, and his *Letters* by Rev. J. G. Cunningham.

AU'GUSTINE, Saint, first archbishop of Canterbury, was originally a monk in the convent of St. Andrew at Rome. In 596, he was sent, along with forty other monks, by pope Gregory I., to convert the Anglo-Saxons to Christianity, and establish the authority of the Roman see in Britain. The missionaries were kindly received by Ethelbert, king of Kent, whose wife Bertha, daughter of the king of the Parisians, was a Christian, and retained a Frankish bishop in her suite as chaplain. A residence was assigned to them at Canterbury, then called *Durovernum*, where they devoted themselves to monastic exercises and preaching. The conversion and baptism of the king contributed greatly to the success of their efforts among his subjects, and it is recorded that in one day A. baptized 10,000 persons in the river Swale. Nominal as much of this conversion must have been, there is abundant testimony to the fact that a marked improvement in the life and manners of the Anglo-Saxons followed the evangelistic labors of A. and his companions.

In 597, he went to Arles, by direction of the pope, and was there consecrated archbishop of Canterbury and metropolitan of England. On his return, he dispatched a presbyter and monk to Rome, to inform the pope of his success, and obtain instruction on certain questions. Gregory's advices with regard to the propagation of the faith are admirable examples of that pious ingenuity which has often characterized the missionary policy of the church of Rome. Thus, instead of destroying the heathen temples, A. was recommended to convert them into Christian churches, by washing the walls with holy water, erecting altars, and substituting holy relics and symbols for the images of the heathen gods. A.'s subsequent efforts to establish his authority over the native British church were not so successful as his missionary labors. He d. in 604, and was buried in the church-yard of the monastery bearing his name, founded by king Ethelbert. His body was removed to the cathedral of Canterbury in 1091. Bede's *Historia Ecclesiastica Gentis Anglorum* is the great authority for the life of St. A. A thoughtful and pleasing sketch of it will be found in the Rev. Arthur P. Stanley's *Historical Memorials of Canterbury*, Lond., 1855.

The site and remains of St. A.'s monastery were purchased in 1844 by Mr. Beresford Hope, by whom they were presented to the archbishop of Canterbury in trust, for the erection of a missionary college in connection with the church of England. This institution was incorporated by royal charter in 1848. The buildings, in which as much of the ancient structure as possible has been preserved, contain accommodation for about 45 students, whose course of study extends over three years. Twenty exhibitions have been founded in connection with the college.

AU'GUSTINES, or Augustin'ians, names given to several religious bodies in the Roman Catholic church. Whether St. Augustine ever framed any formal rule of monastic life, is uncertain; but one was deduced from his writings, and was adopted by as many as 30 monastic fraternities, of which the chief were the Canons Regular, the Knights Templars (q.v.), the Begging Hermits, the Friars Preachers or Dominicans (q.v.), and the Premonstratensians (q.v.). The Canons Regular of St. Augustine, or Austin Canons, appear to have been founded or remodeled about the middle of the 11th century. Their discipline was less severe than that of monks properly so called, but more rigid than that of the secular or parochial clergy. They lived under one roof, having a common dormitory and refectory. Their habit was a long cassock, with a white rochet over it, all covered by a black cloak or hood, whence they were often called Black Canons. In England, where they were established early in the 12th c., they had about 170 houses, the earliest, it would seem, being at Nostell, near Pontefract, in Yorkshire. In Scotland

they had about 25 houses: the earliest at Scone was founded in 1114, and filled by canons from Nostell; the others of most note were at Inchcolm in the firth of Forth, St. Andrews, Holyrood, Cambuskenneth, and Inchaffray.

The BEGGING HERMITS, HERMITS OF ST. AUGUSTINE, or AUSTIN FRIARS, were a much more austere order, renouncing all property, and vowing to live by the voluntary alms of the faithful. They are believed to have sprung from certain societies of recluses who, in the 11th and 12th centuries, existed especially in Italy without any regulative constitution. At the instigation, as is alleged, of the rival fraternities of Dominicans and Franciscans, pope Innocent IV., about the middle of the 13th c., imposed on them the rule of St. Augustine, whom they claimed as their founder. In 1256, pope Alexander IV. placed them under the control of a superior or president called a "general." In 1287, a code of rules or constitutions was compiled, by which the order long continued to be governed. About 1570, friar Thomas of Jesus, a Portuguese brother of the order, introduced a more austere rule, the disciples of which were forbidden to wear shoes, whence they were called *discalceati*, or "barefooted friars."

The degeneracy of the order in the 14th c., called into existence new or reformed Augustinian societies, among which was that Saxon one to which Luther belonged. But in his day, even these had fallen victims to the general corruption of the priesthood, and he inflicted serious injury upon it by his unsparing denunciations. After the French revolution, the order was wholly suppressed in France, Spain, and Portugal, and partly in Italy and southern Germany. It was diminished even in Austria and Naples. It is most powerful in Sardinia and America.

The name of A. was given also to an order of nuns who claimed descent from a convent founded by St. Augustine at Hippo, and of which his sister was the first abbess. They were vowed to the care of the sick and the service of hospitals. The Hôtel-Dieu at Paris is still served by them.

AUGUSTO'WO, a t. of Poland, the capital of a circle of the same name, on the Netta, a feeder of the Bug, 138 m. n.e. from Warsaw. It was founded by Sigismund Augustus, king of Poland, in 1557. It has woolen and linen manufactures, and some trade in horses and cattle. Great part of the surrounding district is occupied by lakes and marshes, or covered with forests. Pop. '67, 9354.

AUGUS'TULUS, ROMULUS, the last emperor of the western portion of the Roman empire. His name was Augustus, but the diminutive title under which he is universally known was given him by the Romans on account of the essential littleness of his character. He was the son of Orestes, a Pannonian of birth and wealth, who rose to high rank under the emperor Julius Nepos, whose favor he repaid by stirring up the barbarian troops in the pay of Rome to mutiny against him. On the flight of the emperor, Orestes conferred the vacant throne on his son A. (476 A.D.), retaining all substantial power in his own hands. Orestes, failing to conciliate the barbarians, who had helped him against Nepos, with a grant of the third of the lands of Italy, they, under the command of Odoacer, besieged him in Pavia, and capturing, put him to death. A. yielded at once, and being of too little consequence to be put to death, he was dismissed to a villa near Naples with an annual pension of 6000 pieces of gold. His after-fate is unknown.

AUGUSTUS, CAIUS JULIUS CÆSAR OCTAVIANUS, the son of Octavius and Atia (daughter of Julia, the younger sister of Julius Cæsar), was b. 23d Sept., B.C. 63. The Octavian family came originally from Velitræ, in the country of the Volsci; and the branch from which A. descended was rich and honorable. His father had risen to the rank of senator and prætor, but died in the prime of life, when A. was only 4 years old. A. was carefully educated in Rome under the guardianship of his mother and his step-father, Lucius Marcius Philippus. At the age of 12, A. delivered a funeral oration over his grandmother; at 16, he received the toga virilis. The talents of the youth recommended him to his grand-uncle, Julius Cæsar, who adopted A. as his son and heir. At the time of Cæsar's assassination (Mar. 15, B.C. 44), A. was a student under the celebrated orator Apollodorus, at Apollonia in Illyricum, where, however, he had been sent, chiefly with a view to gain practical instruction in military affairs. He returned to Italy, assuming the name of Julius Cæsar Octavianus, and at his landing at Brundusium, was welcomed by deputies from the veterans there assembled; but declining their offers, he chose to enter Rome privately. The city was at this time divided between the two parties of the republicans and the friends of Mark Antony; but the latter had, by adroit maneuvers, gained the ascendency, and enjoyed almost absolute power. A. was at first haughtily treated by the consul, who refused to surrender the property of Cæsar. After some fighting, in which Antony was worsted, and had to flee across the Alps, A., who had made himself a favorite with the people and the army, succeeded in getting the will of Julius Cæsar carried out. He found an able friend and advocate in Cicero, who had at first regarded him with contempt. The great orator, while imagining that he was laboring in behalf of the republic, was in fact only an instrument for raising A. to supreme power. When Antony returned from Gaul with Lepidus, A. joined them in establishing a triumvirate. He obtained Africa, Sardinia, and Sicily; Antony, Gaul; and Lepidus, Spain. Their power was soon made absolute by the massacre of those unfriendly to them in Italy, and by victories over the republican army in Macedonia, commanded by

Brutus and Cassius. After the battle of Philippi, won by A. and Antony, of which the former unjustly claimed all the credit, whereas it mainly belonged to the latter, the triumvirs made a new division of the provinces—A. obtaining Italy, and Lepidus, Africa. The Perusian war, excited by Fulvia, wife of Antony, seemed likely to lead to a contest between A. and his rival; but was ended by the death of Fulvia, and the subsequent marriage of Antony with Octavia, sister of Augustus. Shortly afterwards, the claims of Sextus Pompeius and Lepidus having been settled by force and fraud, the Roman world was divided between A. and Antony; and a contest for supremacy commenced between them. While Antony was lost in luxurious dissipation at the court of Cleopatra, A. was industriously striving to gain the love and confidence of the Roman people, and to damage his rival in public estimation. At length war was declared against the queen of Egypt, and at the naval battle of Actium (q.v.), B.C. 31, A. was victorious, and became sole ruler of the whole Roman world. Soon afterwards, Antony and Cleopatra ended their lives by suicide. The son of Antony by Fulvia, and Cæsarion, son of Cæsar and Cleopatra, were put to death; and in B.C. 29, after disposing of several affairs in Egypt, Greece, Syria, and Asia Minor, A. returned to Rome in triumph, and closing the temple of Janus, proclaimed universal peace.

His subsequent measures were mild and prudent. To insure popular favor, he abolished the laws of the triumvirate, adorned the city of Rome, and reformed many abuses. At the end of his seventh consulship (B.C. 27), he proposed to retire from office, in order that the old republican form of government might be re-established, but he was ultimately induced to retain his power. Hitherto, since Cæsar's death, the consul had been named Octavian; but now the title of *Augustus* (meaning "sacred" or "consecrated") was conferred on him. In the eleventh consulship of A. (B.C. 23), the tribunitian power was conferred on him for life by the senate. Republican names and forms still remained, but they were mere shadows. A. was in all but name absolute monarch. In 12 B.C., on the death of Lepidus, he had the high title of pontifex maximus, or high priest, bestowed on him. The nation surrendered to him all the power and honor that it had to give.

After a course of victories in Asia, Spain, Pannonia, Dalmatia, Gaul, etc., A. (9 B.C.) suffered the greatest defeat he had sustained in the course of his long rule, in the person of Quintilius Varus, whose army was totally destroyed by the Germans.

This loss so afflicted A. that for some time he allowed his beard and hair to grow, as a sign of deep mourning, and often exclaimed: "O Varus, restore me my legions!" From this time A. confined himself to plans of domestic improvement and reform, and so beautified Rome, that it was said, "A. found the city built of bricks, and left it built of marble." He also founded cities in several parts of the empire; and altars were raised by the grateful people to commemorate his beneficence; while by a decree of the senate, the name Augustus was given to the month Sextilis.

Though surrounded thus with honor and prosperity, A. was not free from domestic trouble. The abandoned conduct of his daughter Julia was the cause of sore vexation to him. He had no son, and Marcellus, the son of his sister, and Caius and Lucius, the sons of his daughter, whom he had appointed as his successors and heirs, as well as his favorite step-son Drusus, all died early; while his step-son Tiberius was an unamiable character whom he could not love. Age, domestic sorrows, and failing health warned him to seek rest; and to recruit his strength, he undertook a journey to Campania; but his infirmity increased, and he died at Nola (Aug. 19, A.D. 14), in the 77th year of his age. According to tradition, shortly before his death, he called for a mirror, arranged his hair neatly, and said to his attendants: "Have I played my part well? If so, applaud me!" A. had consummate tact and address as a ruler and politician, and could keep his plans in secrecy while he made use of the passions and talents of others to forward his own designs. The good and great measures which marked his reign were originated mostly by A. himself. He encouraged agriculture, patronized the arts and literature, and was himself an author; but only a few fragments of his writings have been preserved. Horace, Virgil, and all the most celebrated Latin poets and scholars, were his friends. His was the *Augustan age* of literature. His death threw a shade of sorrow over the whole Roman world; the bereaved people erected temples and altars to his memory, and numbered him among the gods.

AUGUSTUS, Elector of Saxony (1553–1586), son of duke Henry the pious, and of Katherine of Mecklenburg, was b. July 31, 1526, at Freiberg, then the seat of his father's court. While still a youth, he spent some time at Prague, and there formed an intimate friendship with Maximilian, king Ferdinand's son, afterwards emperor of Germany. In 1548, he married Anna, daughter of Christian III. of Denmark, who was universally popular on account of her devoted adherence to Lutheranism and of her domestic worth. After the death of his brother Maurice in 1553, A. succeeded to the electorate. His rule is chiefly noticeable as bearing upon the history of the newly established Protestant church. Equally intolerant and inconsistent in his theology, A. first used his utmost influence in favor of the Calvinistic doctrine of the sacraments; and then, in 1574, adopted the Lutheran tenets, and persecuted the Calvinists. On the other hand, however, it must be owned, to his honor, that, by his skillful internal administration, he raised his country far above the level of any other in Germany, introducing valuable reforms both in jurisprudence and finance, and giving a decided impetus to education, agriculture, manufactures, and commerce. He even wrote a book on the

management of orchards and gardens, and commanded that every newly-married pair should, within the first year of their marriage, plant two fruit-trees. The Dresden library owes its origin to him, as do also most of its galleries of art and science. His own favorite private pursuit was that of alchemy, in which the electress Anna also took a part. In the Jan. of 1586—the electress having died in the previous year—A. married a young princess of Anhalt, but died a month after, and was buried in the cathedral of Freiberg. He was succeeded by his son, Christian I.

AUGUSTUS II., FREDERICK, commonly called the Strong, elector of Saxony and king of Poland, second son of the elector, John George III., and of the Danish princess, Anna Sophia, was born at Dresden in 1670. His extraordinary strength was developed by a careful physical education, and his mental faculties more successfully cultivated than his morals. From 1687 to 1689 he traveled over the greatest part of Europe, but was prohibited by his father from visiting Rome. Upon his father's death (1691), he went to Vienna, and there formed an intimacy with Joseph, king of Rome, which materially influenced his politics. When, in 1694, he succeeded to his brother George as elector, instead of turning his arms against France, according to previous arrangement, he undertook the command of the Austro-Saxon army against the Turks in Hungary. After the battle of Olasch, in 1696, he returned to Vienna as a candidate for the throne of Poland, vacated by John Sobieski. Bidding higher than prince Conti for the crown (10 million Polish florins), and adopting the Catholic faith, he was elected king by the venal nobles; and having, by his imposing force, awed the adherents of Conti, he was crowned at Cracow, 15th Sept., 1697. On ascending the throne, he promised to regain, for his new kingdom, the provinces that had been ceded to Sweden; but his efforts to do this only led to the defeat of himself and his allies, his own deposition as king of Poland, the election of Stanislaus Leszcynski, and the ignominious peace of Altranstädt in 1706. So complete was his humiliation, that A. was compelled to send a letter of congratulation to the new Polish king, together with all the crown-jewels and archives. However, on receiving intelligence of the defeat of Charles XII. at Pultowa, in 1709, he declared the treaty of Altranstädt annulled, marched with a powerful army into Poland, formed a fresh alliance with the czar, and recommenced a war with Sweden, which continued raging with redoubled fury, till the death of Charles XII. at Fredericks-hall, in 1718, gave a new aspect to affairs, leading first to a truce, and eventually to a peace with Sweden. Meanwhile, a confederation, headed by a Polish nobleman, had been formed against the Saxons, and repulsed them with much success, till, in 1716, through the mediation of the czar, a compact was made between the Poles and A., agreeably to which the Saxon troops left the kingdom. The king now found himself obliged to employ conciliation, and the splendor of his dissolute court soon won the favor of the Polish nobles, who followed his example but too closely. Saxony had bitter cause to regret the union of the crowns. Its resources were shamefully squandered, even when want and famine were in the land, on the adornment of the capital, on the king's mistresses, his illegitimate children, and the alchemists who deluded him with hopes of the elixir of life. A supported the fine arts as ministering to luxury, but did little for the cause of science. Despotic in principle, though easy in temper; ambitious as well as luxurious; reckless alike in the pursuit of war and pleasure, death overtook him in the midst of projected festivities. On his way to the Warsaw diet, gangrene of an old wound set in, and he died in Feb., 1733, and was buried at Cracow. By his wife—a Protestant, and daughter of the margrave of Brandenburg-Kulmbach—he left an only son, who succeeded to him. The most celebrated of his numerous illegitimate offspring—amounting, it is affirmed, to somewhere about 300—was Maurice, count of Saxony.

AUGUSTUS III., FREDERICK, elector of Saxony and king of Poland, the son and successor of the above, was born in Oct., 1696, and carefully educated by his mother in the Protestant faith. At the age of 15, however, he left her tutelage for a tour through Germany, France, and Italy, where he changed his religion, secretly professing Catholicism at Bologna, in 1712, though the fact was not publicly known in Saxony till five years later. It is possible that an eye to the crown of Poland, and to an alliance with one of the Austrian princesses, may have had something to do with this step. After succeeding his father in the electorate in 1733, he was chosen king of Poland by a part of the nobility; and triumphing over the rival claims of Stanislaus Leszcynski, supported by Louis XV., was unanimously proclaimed three years later. He inherited his father's sumptuous tastes, though not his talents; and his love of art, cultivated by his Italian tour, enriched the gallery of Dresden with noble paintings. The government of his country he made over entirely to his prime minister, count von Bruhl, whose whole political system consisted in complete dependence upon Russia. In 1742, alarmed at the increased power Prussia had obtained by the conquest of Silesia, A. formed an alliance with Maria Theresa; and by the secret treaty of Leipsic, contracted to supply her with 50,000 men. But their united troops were completely routed by the Prussians in 1745; and Frederick II. pushing on into Saxony, A. had to escape from his capital, saving his art-treasures, but leaving his state-papers in the hands of the conqueror. In 1746, the peace of Dresden restored him Saxony; but the close of the year again saw him embroiled with Prussia. Joining the camp at Pirna, he narrowly escaped being

taken prisoner, and had to flee to Poland, where his popularity, never very great, was much diminished by his recent reverses in Saxony, added to which the empress Catharine of Russia used every effort to dislodge him, as being an ally of France. At the conclusion of the peace of Hubertsburg, A. returned to Dresden, where he died in 1763. His son, Frederick Christian, succeeded him in the electorate, and Stanislaus Poniatowski became king of Poland.

AUGUSTUS FREDERICK, 1773–1843, Prince of Great Britain and Ireland, duke of Sussex, sixth son of George III. At Rome he married Lady Augusta Murray, daughter of the earl of Dunmore, a Roman Catholic; but the marriage was annulled because he had acted without the consent of the crown. She separated from him at once, and their children, a son and a daughter, took the name of D'Este. In 1801, A. was made a peer, with a grant of £12,000 a year, to which £9000 was subsequently added. He was a liberal on most questions, and favored the abolition of the slave-trade, Roman Catholic and Jewish emancipation, free trade, and the reform bill. In 1810, he was grand master of freemasons; in 1816, president of the society for the encouragement of useful arts; and in 1830, president of the royal society. The prince was a liberal patron of literature and the arts, and possessed an unusually fine library.

AUK, *Alca*, a genus of web-footed birds, the type of a family called *alcadæ*, which was in great part included in the Linnæan genus *alca*, and to many of the species of which, now ranked in other genera, the name A. is still popularly extended. The *alcadæ* are amongst those web-footed birds collectively called *brachypteres* (i.e., short winged) or divers by Cuvier, remarkable for the shortness of their wings, which they employ as fins or paddles for swimming under water, some being even incapable of flying; and for the position of their legs, further backward than in other birds, which makes walking difficult, and compels them, when on land, to maintain an upright attitude. They are distinguished by the very compressed bill, which, in the true auks, is vertically elevated, and so sharp along the ridge as to resemble the blade of a knife; and by their entirely palmated feet, destitute of hind toes. The auks are entirely confined to the seas of the northern hemisphere—the penguins taking their place in the southern—and are most abundant in the colder regions. All of them have a dense plumage, which generally exhibits on its surface a beautifully polished appearance and silvery lustre. The genus *alca*, as restricted by Cuvier and others, contains only two species, distinguished from the puffins (q.v.), which also belong to this family, chiefly by the greater length of the bill, and its being covered with feathers as far as the nostrils. The bill, both in the auks and puffins, is transversely and strongly grooved. But even the two known species of the restricted genus *alca* differ from one another in a most important particular—the wings of the one, the great A., being so short that it is quite incapable of flight, like the penguins, of which it may be deemed the true northern representative, whilst the other, the razor-bill, has comparatively long wings, and flies well.—The GREAT A. (*alca impennis*), so far as is known, is now extinct. It was as large as a goose. It was an inhabitant of the most northerly shores, and a very rare visitant of the Orkney and Shetland islands and the Hebrides. It was almost equally rare in Norway and Sweden, but was formerly frequent in Iceland and Greenland, and localities on the coasts of Labrador and Newfoundland. The rapidity with which this bird moved under water was extraordinary; one of them having been pursued by a six-oared boat for hours in vain. Like most of the *alcadæ*, the great A. laid only one egg, about 5 in. in length, and 3 in its greatest breadth. The egg was laid on the bare rock, without any attempt at a nest.—The RAZOR-BILL (q.v.) (*A. torda*) is the only other species now commonly included in the genus *alca*. The name LITTLE A. is often given to a bird also called the ROTCHE (q.v.) (*mergulus alle*, formerly *alca alle*), common in arctic regions. —The common puffin is sometimes called the Labrador auk.—The northern parts of the Pacific ocean abound in auks remarkable for a somewhat quadrangular bill, notched near the tip, and which form the genus *phaleris*. One of them, *P. psittacula* is known as the parrakeet auk. —All the auks feed upon fishes, crustaceans, and other marine animals, which they pursue under water, and for which they dive to great depths.

AULAF, or ANLAF, d. 980; a pagan king of Northumberland. Athelstan expelled him from Northumbria, whence he fled to Ireland. In 937 he tried to recover his kingdom, but was driven out and went back to Ireland to ravage that country. After Athelstan's death, A. recovered Northumbria by defeating Edmund at Tamworth. Edred, Edmund's successor, compelled A. to embrace the Christian religion; but the Christians themselves drove him out, and he once more went to Ireland, where he defeated and put to death Murdock, king of Leinster, in 957. Other princes fell before him, and he called himself king of Ireland. In 980 he lost his son and heir, and went on a pilgrimage to Iona, where he died.

AULAPOLAY', or ALEPPI, a t. of India, in the native state of Travancore, on the sea-coast, in 9° 30′ n. lat., and 76° 24′ e. long. There is no shelter for shipping, but ships anchor 4 or 5 m. from the shore. There is, however, a considerable trade in timber, betel-nut, coir, pepper, and cardamoms. This t. communicates with Quilon and Trivandrum on the s., and with Cochin on the n., by canals parallel with the sea-coast, and connecting a series of lakes or back-waters. Between these and the sea is a com-

munication by a wide creek, through which the timber for exportation is floated, which is brought from the forests of the rajah of Travancore on the western Ghauts.

AULIC COUNCIL (Lat. *aula*, court or hall), one of the two highest courts of the old German empire, co-ordinate with the imperial chamber. It came into existence in 1495, and seems to have been at first employed principally in preparing business matters regarding the crown lands and the empire generally, in order to expedite the decisions of the imperial chamber. It soon, however, began to assume or acquire higher functions. After 1502, the states submitted important grievances to its independent consideration; but it did not receive a fixed constitution before 1559. In 1654, it was formally recognized as the second of the two supreme courts, and equal in dignity to the imperial chamber. It was composed of a president, a vice-president, a vice-chancellor, and eighteen councilors, who were all chosen and paid by the emperor, with the exception of the vice-chancellor, who was appointed by the elector of Mainz. Of the eighteen councilors, six were Protestants, whose votes, when they were unanimous, could not be set aside by those of the others, so that a religious parity was to some extent preserved. The councilors were divided into three classes—counts, barons, and men of learning—all of whom were on a footing of equality, except that the last mentioned received a higher salary, and were usually advanced into the ranks of the nobility. The council held aloof from politics, but under its jurisdiction were placed: 1st. All matters of feudality in which the emperor was immediately concerned; 2d. All questions of appeal on the part of the states from decisions in favor of the emperor in minor courts; 3d. Whatever concerned the imperial jurisdiction in Italy. On the death of the emperor, the council was dissolved, and had to be reconstructed by his successor. It finally ceased to exist on the extinction of the old German empire in 1806.

AULIS, a t. in Bœotia, on the Euripus strait, where the Greek fleet assembled before sailing for Troy. Its temple of Artemis was standing in the time of Pausanias, but the t. contained only a few workers in pottery.

AULNAY DE CHARNISÉ, CHARLES DE MENOU, a French land-owner, conspicuous in the history of Acadie, or Nova Scotia. He was agent first for Isaac de Radzilly, proprietor of Acadie, and afterwards for Charles, the brother of Isaac, whose rights he purchased. There was a long contest between A. and La Tour, a rival proprietor, in which both sought aid from New England. A. triumphed, capturing Mme. La Tour, in 1645, after which he was appointed governor. His widow married his rival, La Tour.

AULUS GELLIUS, a Latin author in the time of the Antonines, of whom little is known beyond his *Noctes Atticæ*, a mass of ill-digested but valuable information concerning the men and manners of the age.

AUMALE, a t. in France, 40 m. n.e. of Rouen; pop. '66, 2929. Here, in 1592, in a battle between the Spaniards and French, Henry of Navarre was wounded. A. was a county in the early part of the 15th c., and belonged to Claude Lorraine, son of Rene II. Claude was created duke of Guise, and became the head of that famous house.

AUMALE, a t. of Algeria, on one of the headwaters of the Sahel, 57 m. s.e. from Algiers. It is situated on the great road from Algiers to Constantine. It is a strong military post, with barracks, magazines, and hospitals. Pop. 5196, of whom 1468 are Europeans.

AUMALE, CHARLES DE LORRAINE, Duc d', b. 1554, was an ardent partisan of the league in the politico-religious wars which devastated France in the latter half of the 16th century. The aim of the league was ostensibly to suppress the Huguenots, but in reality to secure the supreme power to the Guises. Closely allied by blood to this crafty and ambitious family, A. from the very first entered with fanatical sympathy into its schemes, and after the murder of the duke of Guise at Blois, in Dec., 1588, he became, along with the duke of Mayenne, the leader of the party. In 1589, he seized Paris, dissolved the parliament, and imprisoned its members. Shortly after, he put himself at the head of a body of troops to attack the town of Senlis, but was defeated by La Noue, and compelled to retreat. Always unfortunate in war, his presence seemed invariably to insure the overthrow of his friends. He commanded a portion of the forces of the league at the battles of Arques and Ivri, where the Huguenots triumphed under their skillful and sagacious monarch, Henry IV. But A. was as obstinate as he was unlucky, and in the end proved himself as traitorous as he was obstinate. He held out for the league in Amiens until the populace expelled him, when he suddenly allied himself with the Spaniards who had invaded Picardy, refused the royal pardon, and delivered over to the enemy several places in his possession. For this he was impeached, condemned, and sentenced to be broken alive on the wheel. His property was confiscated, but he himself escaped. He lived in exile till his death, which took place at Brussels, in 1631. He left no male posterity.

AUMALE, HENRI-EUGENE-PHILIPPE, LOUIS D'ORLÉANS, Duc d', b. at Paris, Jan. 16, 1822, is the fourth son of the late king of France, Louis Philippe. He enjoyed the privilege —so rare among princes—of being educated along with his fellow-men, at the college of Henri IV., where he exhibited considerable talent, and obtained several honors. When 16 years of age, he entered the army, soon distinguished himself by his bravery, and passed rapidly through the various grades of rank. In 1843, he embarked at Brest for Algeria, where he commanded a subdivision of the French army, and performed some brilliant

exploits, the most signal of which was his surprising Abd-el-Kader, when encamped in the environs of Goudjilab. By this *coup de main*, which occurred on the 16th of May, 1843, there fell into his hands a multitude of cattle, 4 standards, 3600 prisoners, and the correspondence and treasure of the emir. He was, in consequence, elevated to the rank of lieutenant-general, and appointed to the government of the province of Constantine. In 1847, he succeeded marshal Bugeaud in the governor-generalship of Algeria. While holding this high office, he was exposed to a series of bitter attacks by the democratic "opposition" in the chamber of deputies, but was ably defended by Guizot. After the expulsion of his father, he withdrew from Algeria, having first, with self-denying patriotism, exhorted the colony peaceably to obey the orders of the metropolis. He then resided in England till 1871, when he returned to France, and was elected a member of the assembly. He was elected a general of division in 1872, and presided over the council of war which tried marshal Bazaine. He was elected a member of the academy in 1871. His chief writings are *Les Zouaves et les Chasseurs-à-pied*, and *Histoire des Condés*.

AUNE, the French cloth-measure corresponding to the English *ell*. Both words are derived from the Lat. *ulna*. The English ell = $1\frac{1}{4}$ yard = 45 inches; the French *aune usuelle* (or *nouvelle*) = $1\frac{1}{8}$ mètre = $47\frac{1}{4}$ inches English. The old *aune* was a little shorter.

AUNOY, MARIE-CATHERINE-JUMELLE DE BERNEVILLE, Comtesse d', a celebrated French authoress of the reign of Louis XIV. She was b. about 1650, and d. at Paris, Jan., 1705. She composed fairy tales, romances, and historical memoirs. Among her fairy tales may be mentioned, *The Yellow Dwarf*, *The White Cat*, and *Cherry and Fair Star*. Many of these fictions have been translated into English, and are greedily read by schoolboys. They have, both in France and other countries, gone through numerous editions, and are the sole monuments of her fame; for her sentimental novels, *Hippolyte*, and *Comte de Duglas*, have long ago vanished from the eyes of men; while her historical memoirs are not regarded as at all trustworthy.

AURANTIA'CEÆ (from *aurantium*, modern Latin for an orange), a natural order of exogenous plants, consisting of trees and shrubs, often of great beauty. Both leaves and bark are generally very smooth, and all parts are filled with little transparent receptacles of a fragrant volatile oil, which especially abounds in the leaves and in the rind of the fruit. The leaves are alternate, and always articulated with their stalks, which are frequently winged. The flowers have a short 3 to 5 toothed, withering calyx, and 3 to 5 petals, which are broad at the base, sometimes slightly coherent, and imbricated in bud. The stamens are equal in number to the petals, or a multiple of their number; the filaments sometimes slightly coherent in one or more bundles; the anthers terminal and erect. The stamens and petals are inserted on a disk. The ovary is free; there is one style with a thickish stigma. The fruit (a *hesperidium*) is pulpy, with a leathery or spongy rind, of one cell, or of a number of separable cells; the seeds attached to the axis, with thick cotyledons and no albumen, not unfrequently containing more embryos than one. —The order contains about 100 known species, natives of warm climates, and almost all of the East Indies. The species of the genus citrus (q.v.) are the best known, among which are the orange, lemon, citron, etc. But the order contains many other plants producing agreeable fruits, among which the *ægle marmelos* (see ÆGLE)—called bhel or bael, in India—*cookia punctata* (the wampee), *glycosmis citrifolia*, and *triphasia trifoliata* deserve particular notice. The fruits, ripe and unripe, juice and rind, the flowers, leaves, bark, etc., of a number of species are employed medicinally. The medicinal uses of *ægle marmelos* have been already noticed in the article ÆGLE; those of the species of *citrus* will be mentioned under their proper heads. The leaves of *bergera kœnigii* are used by the Hindoos as a stomachic and tonic, the bark and roots as stimulants.—*Feronia elephantum*, a large tree growing in most parts of India, yields a gum which closely resembles gum-arabic, and is used for similar purposes. The young leaves of this tree have a smell like that of anise, and are used by the native practitioners of India as a stomachic and carminative.—*Skimmia* (or *limonia*) *laureola* and *skimmia japonica* are remarkable exceptions in this order, as to the climate to which they are adapted: the former grows on the cold and lofty mountains of the n. of India, braving frost and snow; the latter, a beautiful shrub, recently introduced into Britain from Japan, is perfectly hardy even in the severest winters; its evergreen leaves and pretty little red berries remaining quite uninjured by frost, whilst its small white flowers, produced early in summer, have the fragrance of orange blossoms.

AURE'LIA. See CHRYSALIS.

AURELIA'NUS, LUCIUS DOMITIUS—also named CLAUDIUS DOMITIUS and VALERIUS —one of the most powerful of the Roman emperors, was of very humble origin, his father having been a husbandman. He was b. about A.D. 212, and enlisting early as a common soldier, he rapidly distinguished himself, and held the highest military offices under Valerianus and Claudius II. On the death of Claudius (A.D. 270), A. was elected emperor by the army. He commenced his reign by vigorous opposition to the barbarian Alemanni, or Marcomanni, whom he expelled. Thereafter, he commenced the erection of a new line of fortified walls round Rome, which were not completed till the reign of Probus (A.D. 276). Their ruins still mark the boundaries of Rome in the time of Aurelian. Finding that the province of Dacia (now Wallachia) could not be maintained

against the assaults of the Goths, he surrendered it, on certain conditions, and strengthened the frontier of the Roman empire by making the Danube its boundary. He next turned his attention to the east, where the renowned queen, Zenobia (q.v.), had extended her sway from Syria to Asia Minor and Egypt. A. defeated her in two battles, and besieged her in Palmyra, from which she attempted to escape, when she saw defense would prove unavailing. She was, however, taken prisoner, and soon after the city surrendered, and was treated leniently. Shortly after A. had departed, a new insurrection took place. He returned in 273, and gave the splendid city up to destruction. A. was again called to the east by a rebellion in Egypt, instigated by Firmus, a merchant of great influence, which he speedily quelled. Besides, Tetricus, who had held imperial power in Gaul since before the death of Gallienus, finding himself unable to wield, surrendered it to Aurelian. By restoring good discipline in the army, order in domestic affairs, and political unity to the Roman dominions, A. merited the title awarded to him by the senate—"restorer of the Roman empire." He fell a victim to conspiracy during his campaign against the Persians (A.D. 276).

AURE'LIUS, MARCUS. See ANTONINUS.

AURELLE, or D'AURELLE, DE PALADINES, b.1803; a French soldier, distinguished in the Crimean war. In the German war he was the commander of the fifth French division at Metz. After Napoleon's fall he organized the army of the Loire, drove Von der Tann from Orleans, and won the first victory for France, for which he received the chief command of the army of the Loire. He was repulsed in an attack upon the army of prince Frederick Charles, and beaten by the grand duke of Mechlenberg at Artemay; the next day prince Frederick drove him back to the forest of Orleans and took possession of the town. A. was soon afterwards removed from his command, and offered that of the camp at Cherbourg, which he refused, and he also refused to succeed gen. Chanzy. In the national assembly he was opposed to continuing the war. At a later period he was commander of the national guards in the department of the Seine, and a member of the Bazaine court-martial.

AURE'OLA, or AU'REOLE, the halo, or "glory," with which old painters encircled the heads and sometimes the entire persons of angels, saints, and martyrs. The circle with a cross was given to the Saviour only; without the cross, to canonize saints. Though supposed to be a Christian invention, it appears that it was used long before Christ in pictures of Hindoo deities.

AU'REUS, or DENA'RIUS AUREUS, the oldest standard gold coin of Rome, coined 207 B.C.; average weight, 121 grains.

AU'RICLES, two cavities of the heart. See HEART.

AURIC'ULA, *Primula auricula*, a plant of the same genus with the primrose (q.v.), much cultivated in flower-gardens. The A. has long been a florist's flower. It was highly esteemed by the Romans, and has, at least since the beginning of the 18th c., received particular attention from the florists of England and Holland. It is one of those flowers, the cultivation of which is often most successfully prosecuted in the little gardens of operatives near large towns. Lancashire is particularly famous for it.—The A. has smooth, dark-green leaves, scapes (or leafless stems), and calices, covered with a mealy powder. A similar fine meal appears also on the flowers, and adds much to their beauty. The A. is a native of the Alps and other mountains of the middle and s. of Europe, and of sub-alpine situations in the same countries. It is found also on the Caucasus and the mountains of Syria; it grows in shady and moist places. In a wild state, it has comparatively small flowers, of a simple yellow color, on short stalks, forming an umbel of generally six or seven on one scape, with the same delightful fragrance which aids so much to made it a favorite flower in cultivation. The leaves are used by the inhabitants of the Alps as a remedy for coughs.

By cultivation and art, the A. has been brought to great beauty and splendor of color. Red, pink, crimson, apple-green, and mulberry are the chief colors which the different varieties exhibit. More than 1200 varieties have been reckoned, and new ones are continually raised from seed. Some of them are entirely of one color, others of two or more; some are delicately shaded, and some variegated. The mere color of an A. is not of so much consequence, in the eye of a florist, as the form and shading. The chief requisites of a good A. are large flowers, so many of them on one scape as to give fullness to the umbel, the flower-stalks so strong that the flowers do not hang down; the scape itself must be so tall, that the umbel of flowers may rise completely above the leaves, and so strong as to bear it erect; the flower must be nearly round; the white or yellow eye in its center must be distinct and round, its color not mixing with the ground color, which, however, may mix at the outer part with the green of the margin. The green margin adds much to the beauty of many varieties. The mealiness of the flower differs much in different varieties.—The A. blooms in April and May, and often also a second time in the end of autumn, which adds to the charms of the flower-border, although it is to the first or proper flowering-season that the florist looks. It succeeds best in a rich light soil, and cultivators diligently prepare for it composts of various kinds, but in general consisting chiefly of fresh loamy soil, and of well-rotted horse or cow dung often with the addition of a little sand. The finer varieties are always culti-

vated in pots, and require great attention. They are protected from the severe weather of winter, and during the flowering-season, from wind and rain. They ought, however, previous to flowering, to stand in an airy, sunny situation. Their delicacy forms a striking contrast to the natural hardiness of the plant; but few sights are more pleasing than that of a collection of choice auriculas, tastefully arranged. They are propagated by offsets, generally in the latter part of August.—When it is proposed to raise the A. from seed, care ought to be taken to select the finest flowers, which are encouraged to ripen their seeds by exposure to sun and air, hand-glasses being placed over them during heavy rains. The seed is sown either in autumn or spring, generally in boxes placed under shelter, or in a slight hot-bed. The more weakly plants are tended with particular care, as they are generally found to produce the finest flowers.

The name A., originally Latin, is derived from *auris*, an ear on account of a fancied resemblance of the leaves to the ears of an animal.

AURIC'ULA, a genus, and AURICU'LIDÆ, a family of gastropod mollusca. They have a spiral shell, covered with a horny epidermis, the first whirl very large and the spire short, the aperture elongated and toothed. They belong to that section of gastropods in which the sexes are united in the individual, and to the same order with the common snails, having respiratory organs adapted for breathing in air, although some of them are capable of subsisting for a considerable time in water. Some of them inhabit fresh-water marshes, and others prefer the vicinity of salt water. They generally belong to warm climates, and some of them attain a large size. *Auricula midæ*, a native of the East Indies, is known to shell collectors by the name of Midas's ear.

AURIC'ULAR CONFESSION. See CONFESSION.

AURIC'ULATE, in botany, a term applied to leaves, stipules, etc., and signifying that they have at the base two small ear-like lobes.

AURIFABER (Lat. for GOLDSCHMIDT), JOANNES, 1519–79; a Lutheran divine, friend and companion of the reformer. He was educated at Wittenberg, became tutor to count Mansfeldt, and in the war of 1544 was with the army as chaplain. Afterwards he lived with Luther as his secretary, and was present at his death. Half of the next year he was in prison with the elector of Saxony, who had been captured by Charles V. He was for some years court preacher at Weimar, and in 1566 was appointed minister of the Lutheran church at Erfurt, holding the place until his death. He collected many of Luther's manuscripts and letters, and assisted in editing them. He also published *Luther's Table Talk*, in 1566.

AURI'GA, or THE WAGONER; a northern constellation in which is Capella, a very brilliant star of the first magnitude.

AURILLAC, a t. of France, capital of the dep. of Cantal (Auvergne). A. is situated in a pleasant valley on the banks of the Jourdanne, about 269 m. s. from Paris. It is said to owe its origin to a Benedictine monastery founded in the 9th c. by St. Gerard. The English, in the 14th and 15th centuries, often besieged the town, and it was frequently taken and pillaged during the religious wars in France in the 16th century. The streets are wide, but irregular, and are kept clean by streams supplied by a reservoir above the town and by a canal from the Jourdanne. The neighboring quarries supply slates to cover the houses. The principal buildings of A. are the churches of Notre Dame and St. Gerard, St. Stephen's castle, the theater, college buildings, which contain a valuable public library, and the corn market. There is also a monument erected to the memory of the French philanthropist, M. de Montyon. Paper, jewelry, lace, copper utensils, leather, and beer are the chief industrial products. Pope Sylvester II. was b. at A., and the infamous Carrier of the first French revolution. Pop. '76, 10,399.

AURIOL, a t. in France, in the dep. of Bouches-du-Rhône, 16 m. n.e. of Marseilles; pop. '66, 5182. The manufacture of flags is a prominent business, and there are coal-mines near the town.

AUROCHS, the European bison; a wild animal of the *bos* family, once plentiful over northern Europe, but now scarce and probably to be found only in the royal Lithuanian forests, where it is protected. The A. was probably contemporary with the mammoth, and it is thought to be the animal described in Cæsar's works as abundant in the forests of Gaul. There were two species, *bos urus* and *bos primigenius;* and of both fossil remains are found in post-tertiary deposits in Europe and America. It has been suggested that the animal furnished food for prehistoric mankind.

AURORA (styled *Eos* by the Greeks), the goddess of the dawn, or "morning redness," was the daughter of Hyperion and Theia, and sister of Helios and Selene, and wife of the Titan Astræus. Zephyrus, Boreas, Notus, Hesperus and the other stars were her children. She was described as rising in the morning from her bed in the ocean, borne along on a chariot drawn by the divine steeds Lampus and Phaëton, ascending heaven from the river Oceanus, where she lifted with her "rosy fingers" the curtain of night, and announced the light both to gods and men. Homer frequently describes A. as the goddess of day, and the tragic writers identified A. with *Hemera* (the day). She was represented as clothed in a rosy-yellow robe, with a star shining on her forehead, and a torch in her right hand. She had a passion for mortal youths, and carried off Orion, Cleitus, and Tithonus.

AURORA, a city in Kane co., Ill., on Fox river, and the Chicago and Iowa, and Chicago, Burlington and Quincy railroads, 38 m. s.w. of Chicago; pop. '80, 12,059. The river furnishes abundant water-power for manufacturing purposes. There are railway repair shops here, which employ about 1000 men.

AURORA, a city in Dearborn co., Ind., on the Ohio river, and the Louisville branch of the Ohio and Mississippi railroad; 25 m. below Cincinnati. It has a number of manufactories, but the river trade is the most important business. Pop. '70, 3304.

AURORA BOREALIS, or NORTHERN LIGHTS, (Ger. *Nordlicht*), the name given to the luminous phenomenon which is seen towards the n. of the heavens by the inhabitants of the higher latitudes. During the winter of the northern hemisphere, the inhabitants of the arctic zone are without the light of the sun for months together, and their long dreary night is relieved by the light of this beautiful meteor, which occurs with great frequency in these regions. Those who have explored the southern seas have seen the same phenomenon in the direction of the south pole, so that the term polar lights might be more appropriate than northern lights to designate the aurora. The appearance of the A. B. has been described by a great variety of observers, both in northern and central Europe, all of whom give substantially the same account of the manner in which the phenomenon takes place. It is briefly as follows: A dingy aspect of the sky in the direction of the n. is generally the precursor of the aurora; and this gradually becomes darker in color, and assumes the form of a circular segment, surrounded by a luminous arch, and resting at each end on the horizon. This *dark segment*, as it is called, has the appearance of a thick cloud, and is frequently seen as such in the fading twilight before the development of the auroral light. Its density must, however, be very small, as stars are sometimes seen shining brightly through it. This dark segment is bounded by a luminous *arch* of a bluish-white color, which varies in breadth from 1 to 6 diameters of the moon, having the lower edge sharply defined, and the upper edge only when the breadth of the arch is small. This arch may be considered to be a part of a luminous ring elevated at a considerable distance above the earth's surface, and having its center corresponding with some point near the north pole. An observer several degrees s. of this auroral ring would see towards the n. only a small arc of it, the larger part being hid by the earth; to one situated not so far s., it would appear as a larger and higher arch; to one placed below it, it would be seen as an arch passing through the zenith; and to one situated within the ring and further n., it would be found as an arch culminating in the s. On this supposition, nearly all the various positions of the auroral arch may be accounted for. The center of the ring corresponds probably with the magnetic n., which is at present situated in the island of Boothia Felix. Hence it is that in Greenland, which is situated to the e. of this island, the auroral arch has been seen stretching from n. to s. with its highest point in the w. The luminous arch, once formed, remains visible for several hours, and is in a constant state of motion. It rises and falls, extends toward the e. and towards the w., and breaks sometimes in one part, sometimes in another. These motions become all the more observable when the arch is about to shoot forth *rays;* then it becomes luminous at one point, eats in upon the dark segment, and a ray of similar brightness to the arch mounts with the rapidity of lightning towards the zenith. The ray seldom keeps the same form for any length of time; but undergoes continual changes, moving eastward and westward, and fluttering like a ribbon agitated by the wind. After some time, it gradually fades in brightness, and at last gives way to other rays. When the aurora attains its full brightness and activity, rays are projected from every part of the arch, and if they do not rise too high, it presents the appearance of a comb furnished with teeth. When the rays are very bright, they sometimes assume a green, sometimes a violet, a purple, or a rose color, giving to the whole a variegated and brilliant effect. The whole display will sometimes assume the form of a long banner waving in the breeze in a horizontal direction, making a most gorgeous and magnificent display, but this phenomenon is not frequently seen. When the rays darted by the luminous arch are numerous and of great length, they culminate in a point which is situated in the prolongation of the dipping needle, somewhat s.e. of the zenith. There they form what is called the *boreal crown;* and the whole heavens, towards the e., w., and n., present the appearance of a vast cupola of fire, supported by columns of variously colored light. When the rays are darted less brilliantly, the crown first disappears, then, here and there, the light becomes faint and intermittent, till at last the whole phenomenon fades from the sky.

The preceding description indicates the general features of the appearance of the A. B.; but several auroras have been described which presented striking peculiarities. Sometimes the phenomenon assumed the form of one or more curtains of light, depending from dingy clouds, whose folds were agitated to and fro, as if by the wind. Sometimes this curtain seemed to consist of separate ribbons of light, arranged side by side in groups of different lengths, and attaining their greatest brilliancy at the lower edges. In this country the A. B. seldom occurs with the distinctness and brilliancy which attend it in northern latitudes, but the description just given portrays the type to which such appearance of the meteor more or less approximates.

The height of the aurora has been variously estimated. The first observers were

inclined to place the seat of it beyond the atmosphere; but this hypothesis is untenable, as the aurora does not seem to be affected by the rotation of the earth, but appears to be in every respect a terrestrial phenomenon. By taking observations of the altitude of the highest point of the arch of the same aurora at different stations, heights varying from 5 to 500 m. have been calculated. The cause of these widely differing results may be found in the probability that exists of each observer seeing a different arch of the aurora for himself, and he is, in consequence, furnished with no comparable or reliable data for his calculations. It is now, however, generally admitted, on what are considered to be sufficient grounds, that the A. B. occurs at various heights, and that it is seldom found beyond 90 m. above the surface of the earth. The distance of the stations at which the same aurora has been visible, indicates the enormous geographical extent, and likewise the great altitude which the phenomenon frequently attains. One aurora, for instance—that which occurred on the 3d of Sept., 1839—was seen in the Isle of Skye by M. de Saussure; at Paris, by the astronomers of the observatory; at Asti, in northern Italy, by M. Quetelet; at New Haven, in Connecticut, by Mr. Herrick; and at New Orleans, by credible observers. On the other hand, some observers of eminence assert that the aurora sometimes descends to the region of the clouds, and appears almost as a local phenomenon. A brilliant aurora was seen by Mr. Farquharson, the minister of Alford, in Aberdeenshire, on the 20th of Dec., 1829, from 8 to 11:30 in the evening, above a thick bank of clouds, which covered the tops of the hills to the n. of where he lived, and which never attained an altitude of more than 20°. The same aurora was seen in the zenith, at 9:15, by Mr. Paul, another minister, at Tullynessle, which is about 2 m. n. of Alford, so that the height of it could not have been quite 4000 ft.

The noise that is alleged to accompany the A. B. in high latitudes would indicate for it a comparatively moderate height. Some of those who have heard it, compare it to the noise that is produced by the rolling of one piece of silk upon another; and others, to the sound of the wind blowing against the flame of a candle. In Siberia, it has been related that this noise sometimes resembles that attending the discharge of fireworks; and that the dogs of the hunters, when overtaken by such an aurora, lay themselves with terror on the ground.*

The intimate connection between the A. B. and the magnetism of the earth is shown by various facts. During the occurrence of the phenomenon, the magnetic needle appears very much disturbed, sometimes deviating several degrees from its normal position, and appearing to be most affected when the aurora is brightest; and this oscillation is frequently perceived far beyond the district where the aurora is seen. The vertex, likewise, of the luminous arch is almost always found to be in or very near the magnetic meridian, and the boreal crown has its seat in the prolongation of the freely suspended needle. There seems, moreover, to be a connection between the magnetic poles of the earth in regard to the aurora for, so far as has been ascertained, the meteor occurs simultaneously at both. The A. B. appears to be an electric discharge connected with magnetic disturbance. If one of Gassiot's vacuous tubes be brought near an electric machine, or between the poles of an induction coil, flashes of light pass between the ends, which bear a striking resemblance to the A. B. A comparison of the spectra of the two goes far to establish identity. The auroral spectral line, according to Angström, is a yellow line near the sodium line, and is the same as the air line seen in the solar light when the sun is near the horizon. Other lines, however, have been seen, which cannot as yet be produced by the physicist from any known substance.

A line drawn through the s. of Spain to the n. of the Sandwich islands, and through Cuba, marks the southern limit of the A. B. (in the northern hemisphere); though occasional displays have been noticed even further s. To the n. of a line passing through Edinburgh, the frequency of the A. B. rapidly increases, until a maximum is reached in a line through the n. of Spitzbergen, after which the frequency diminishes as the north pole is approached.

AURUNG'ABAD, or *Throne-town,* the name of at least four places in India. The most important is in the territory of the Nizam, situated on the Doodna, a tributary of the Godavery. The pop. is estimated at about 60,000. Its monuments of former grandeur are a palace, now in ruins, built by Aurungzebe, and the mausoleum of Aurungzebe's daughter.

AURUNGZEBE' (properly, Aurangzíb, "ornament of the throne") was the most powerful of the great Moguls, the last who ruled with energy and effect. He was b. on the 23d Oct., 1618, and was 10 years old when, his grandfather dying, his father, Shah-Jehan, ascended the throne. A. early aspired to wield the rod of empire, but he craftily hid his designs beneath the cloak of piety. In 1657, his father, who had previously promoted him to high civil and military offices in the state, in performing the duties of which he greatly distinguished himself, was seized with an illness from which he was not expected to recover. The reins of power were at once seized by his eldest son, Dára, who treated his brothers very arbitrarily—Shujá at that time being governor of Bengal, A. of the Deccan, and Murad of Guzerat. The first immediately took up arms. A.'s policy was

* Arctic voyagers, such as Parry and Franklin, throw doubt on the existence of any such noise, for not one of the numerous and brilliant auroras seen by them was ever attended with the faintest sound.

to let the two fight it out, and exhaust each other, and then to play off his third brother against the victor. He conferred with Múrad; assured him he had no earthly ambition; that the crown he strove for was a spiritual, and not a temporal one; and that, for affection's sake, and with a view to promote the interests of the true faith—Dára was liberal in his religious opinions, and had written a book to prove that Mohammed and Brahma agreed in all essential points—he would support his pretensions to the throne. Múrad believed him, and the forces of the two were joined. Meanwhile, Dára having overcome Shujá's army, directed his forces against his other two brothers; but A.'s plausibility prevailed over Dára's generals, who deserted, and Dára had to seek safety in flight. By this time, however, Shah-Jehan had somewhat recovered. A. professed the utmost loyalty, but secretly gave his son instructions to take possession of Shah-Jehan's palace, which was done, and the aged monarch was made prisoner. A. next seized and confined his too confiding brother, Múrad; and after a struggle of two or three years' duration, Dára and Shujá also fell into his power, and all three were put to death. The scepter was now firmly within the grasp of Aurungzebe. He professed not to care for the imperial insignia, but was ultimately induced to receive them on Aug. 2, 1678. He, at the same time, assumed the presumptuous title of Alemgír, "conqueror of the world." He also took the title of Mohi-eddín, "the reviver of religion." In the seventh year of A.'s reign, his father died, at a good old age; but there are suspicions, nevertheless, that his death was hastened by slow poison, administered by command of his son.

A.'s long reign of half a century was distinguished by great outward prosperity; but the empire was diseased at its heart. Everywhere there was distrust; A., who had established his empire by fraud, was naturally enough distrusted by all. He lacked confidence in his statesmen, who, in their turn, distrusted him and one another. His sons imitated him in his disobedience to his father, and the Hindoos, whom he treated with great harshness, excited the Mahrattas against him in the s. Still his great abilities sufficed during his reign not only to preserve his empire in tact, but even to enlarge it considerably. Discord between the monarchs of Bíjapur and Golconda, which was mainly due to his policy when acting as governor of the Deccan, enabled him to add these two kingdoms to his empire. But the seeds of decay which had been sown in his reign bore ample fruit in the reign of his son. The decadence of the Mogul empire dates from A.'s death, which took place at Ahmednuggur, on the 21st Feb., 1707, in the 89th year of his age, and 50th of his reign. The latter years of A.'s life were passed in misery. The memory of his own crimes weighed heavy on his soul. He lived in constant dread that he himself would receive of the measure which he had meted out to others. His court was remarkable among oriental courts for its economy and freedom from ostentation. A.'s character was not without its good features, as instanced by the fact, that in the third year of his reign, when there was a great famine in the land, he gave unreservedly the funds of his treasury, which had been greatly augmented by his frugality, to procure food for his people.

AU SABLE, a t. and village in Clinton co., N. Y., on the A. S. river, 7 m. from lake Champlain; pop. of township, '70, 2863. In the vicinity of the village is a great chasm or gorge, much visited by tourists.

AUSCULTATION (Lat. *auscultо*, to listen), a mode of detecting diseases, especially those of the heart and lungs, by listening to the sounds produced in the cavity of the chest. This is done either by the unassisted ear (*immediate* A.), or by the aid of a simple sound-conveying instrument, the stethoscope (q.v.) (*mediate* A.). By care and attention, the normal sounds produced by respiration and the beating of the heart may be distinguished from the several abnormal sounds indicating disease. A. is classed among the most important of discoveries in modern medical science. Its details are ably explained by the discoverer, Laënnec. See PERCUSSION.

AU'SONES, a tribe of unknown origin in ancient Italy, said in tradition to be descended from Auson, a son of Ulysses and Calypso. They gave the name Ausonia to southern Italy, afterwards called Magna Græcia. Niebuhr supposes they were of the Oscan nation.

AUSO'NIUS, DECIUS MAGNUS, the most conspicuous Roman poet in the 4th c. after Christ, was b. at Burdegala (Bordeaux), about 309 A.D. Scaliger asserts that his father, Julius A., was the favorite physician of the emperor Valentinian, but the assertion has no historic basis, so far as we know. He was, however, a man of considerable importance, having been at one time honorary prefect of Illyricum, and he appears to have taken care that the young A. should receive an excellent education. Many amiable female relatives fostered, and probably flattered the talents of the boy. After finishing his curriculum at Toulouse, he returned to Bordeaux, where, after practicing for a short time at the bar, he turned his attention to literature, and soon distinguished himself as a professor of oratory. Some years later, he was appointed by Valentinian tutor to his son Gratian; afterwards quæstor, and, by Gratian, prefect of Latium, and subsequently consul of Gaul (379 A.D.). On the death of Gratian, A. retired from public life to his estate at Bordeaux, where he occupied himself with literature and rural pursuits until the time of his death (392 A.D.). The question whether or not A. was a "Christian," has occasioned much controversy, and remains yet unsettled. His works include translations of Greek eclogues, a collection of 150 epigrams, epistles in verse and prose, 20 so-called

idyls and other descriptive pieces, which, though admired in their day, are generally worthless, and bear all the marks of the corrupted taste prevalent in literature during his time. But though destitute of every true poetic quality, A. occasionally displays a certain neatness and grace of expression, which show that, in a better era, he might have proved a greater poet. Besides these, he also wrote a panegyric on the emperor Gratian, full of bombastic phrases and fulsome adulation. Editions of his writings have been given by Scaliger (Leyden, 1575), Tollius (Amsterdam, 1669–1671), and Souchay (Paris, 1730).

AUS'SIG, AUSSYENAD, or LABEN, a t. of Bohemia, at the junction of the Elbe and the Bela, 44 m. n.n.w. of Prague; pop. '69, 10,933. In 1426 A. was destroyed by the Hussites, and in 1639 was seized by Sweden. There is a church here which, it is claimed, was begun in 826, containing a "Madonna" by Carlo Dolce. The trade of A. is in coal, fruits, mineral waters, and timber.

AUSTEN, JANE, a novelist of deservedly high reputation. Her father was rector of Steventon, Hampshire, at which place his daughter was b., Dec. 16, 1775. Mr. Austen, who was himself a gentleman of some literary attainments, bestowed on his daughter an education superior to that usually given to young ladies in her sphere of life in the end of last century. Jane was distinguished alike by good sense, sweetness of disposition, and personal attractions. Her novels, which are rather limited in subject, are remarkable for the truthfulness with which they portray the everyday life of the middle classes of England in her time, and for their delicate, yet withal distinct discrimination of the various shades and peculiarities of character. Sir Walter Scott said of her: "That young lady had a talent for describing the involvements, feelings, and characters of ordinary life which is to me the most wonderful I have ever met with. The big bow-wow I can do myself like any one going; but the exquisite touch, which renders common-place things and characters interesting from the truth of the description and the sentiment, is denied to me." Miss A.'s first four novels—*Sense and Sensibility, Pride and Prejudice, Mansfield Park,* and *Emma*—were published anonymously between 1811 and 1816. *Northanger Abbey* and *Persuasion* followed, with her name on the title-page, in 1818, after her death, which took place at Winchester, July 24, 1817.

AUSTEN, WILLIAM, an English metal-worker and designer of the 15th c., celebrated as the constructor of the famous tomb of Richard de Beauchamp, earl of Warwick, in St. Mary's church, Warwickshire. Men of taste and judgment have not hesitated to put his works on an equality with those of Italian artists of the same period.

AUSTERLITZ, a small t. in Moravia, about 12 m. e.s.e. from the t. of Brünn, stands on the Littawa, and has a pop. of 3800. A. has a handsome palace; but it is celebrated chiefly as the place where Napoleon I., in Dec., 1805, defeated the combined forces of Austria and Russia, under the command of their respective emperors. After the capitulation of Mack, at Ulm, Oct. 17, Napoleon had marched on without opposition to Vienna, of which he took possession Nov. 11, 1805. The Russian and Austrian forces had retreated to Moravia, and Napoleon had fixed his head-quarters at Brünn. Towards this locality the troops of Alexander and Francis marched in five parallel columns to offer battle. The movements of the allies were ill-conducted, and evidently made without a due knowledge of the strength of the French army, which was concealed by the tactics of Napoleon. It amounted to about 80,000 men; while the allied armies numbered 84,000, of which 16,000 were cavalry. The battle commenced at seven, on the morning of Dec. 2, and the Russian line was soon broken. The left wing of the allies suffered severely towards the close of the engagement, and endeavored to save themselves by crossing a frozen lake; but Napoleon ordered his artillery to fire upon the ice, which was broken up, and about 2000 perished in the water. According to Alison, the allies lost 30,000 in killed, wounded, and prisoners, and the French 12,000. Russian and French accounts make their respective losses smaller. The battle was followed by an armistice, the terms of which were dictated by Napoleon; and immediately after, on the 26th of Dec., by the treaty of Presburg, which determined that Austria should surrender the Venetian territories, and also her possessions in Swabia and the Tyrol.

AUSTIN, a co. in s.e. Texas, on both sides of the Brazos; traversed by the Houston and Texas Central railroad; 1024 sq.m.; pop. '70, 15,087—6574 colored. Timber and stock-raising are the chief resources. Co. seat, Bellville.

AUS'TIN, the capital of Texas, lies on the left bank of the Colorado, 200 m. from its mouth, in lat. 30° 15′ n., long. 97° 47′ w. In winter, A. is accessible to steamboats from the sea. Pop. '70, 4428.

AUSTIN, JOHN, a distinguished writer on jurisprudence, was b. on Mar. 3, 1790. At the age of 16, he entered the army, and served as a subaltern with his regiment in Sicily. But he left the service after the peace, and in 1818 was called to the bar. In 1820, he married Miss Sarah Taylor, of Norwich (see AUSTIN, SARAH), to whom he had been attached for many years, and went to live in Queen square, Westminster, next door to Jeremy Bentham and Mr. James Mill. In their society, his attention was naturally turned to the subjects he afterwards cultivated with success. He was compelled by bad health to abandon his practice at the bar, about the time when the university of London

was founded, and he then received the appointment of professor of jurisprudence. To fit himself for the chair, in the autumn of 1827 he settled at Bonn, then the residence of Niebuhr, Brandis, Schlegel, Arndt, Welcker, and Mackeldey, and he remained there throughout the winter. He returned to England well acquainted with the writings of some of the most eminent of the continental jurists. His lectures were well received by a few distinguished men; but the subject was not recognized as a necessary branch of legal study, and evidently did not supply that kind of knowledge best calculated to promote practical success in the legal professions. A. believed the position of a German professor of law to be the most enviable in the world; and with a small but sure income, he would have devoted his great powers to the exclusive cultivation of the subjects discussed in his lectures. But, unfortunately, no provision was made for the chair of jurisprudence beyond class fees, and in the absence of students, A., in 1832, was reluctantly compelled to resign his appointment. In the same year, he published his *Province of Jurisprudence Determined*, a work, at the time, little appreciated by the general public, and the small success it met did not encourage him to undertake other publications on the allied subjects. In the estimation of competent judges, however, it placed its author in the highest rank among writers on jurisprudence. In 1833, he was appointed by lord Brougham a member of the criminal law commission. The post was not much to his taste, as he did not believe that the public received any advantage from such bodies, in the efficacy of which for constructive purposes he put no faith. "If they would give me £200 a year," he said, "for two years, I would shut myself up in a garret, and at the end of that time I would produce a complete map of the whole field of crime and a draft of a criminal code." These, he thought, a commission might with some profit revise and amend. A. was afterwards appointed a member of a commission to inquire into the grievances of the Maltese. He returned to England in 1838, not in good health, and was advised to try the springs at Carlsbad. During his stay in Bonn he had been delighted with the respect the Germans manifest for knowledge, their freedom of thought, and the simplicity of their habits. With his slender means, decent existence in England was scarcely possible, and he removed with his family to Germany, living at Carlsbad in summer, at Dresden and Berlin in winter. The revolution of 1848 drove him back to England, and he then settled at Weybridge, where he d. in Dec., 1859, universally respected for the dignity and magnanimity of his character. His lectures on the principles of jurisprudence had remained in manuscript and imperfect. Since his death they have been prepared for the press by his widow, and published between 1861 and 1863, under the title of *Lectures on Jurisprudence, being a Sequel to "The Province of Jurisprudence Determined," etc.* On this work his fame now rests.

A.'s great merit consists in his having been the first English writer who attached precise and intelligible meaning to the terms which denote the leading conceptions underlying all systems of jurisprudence. With a very perfect knowledge of the methods of Roman and English law, he displayed genius of the highest order in devising a novel system of classification for the subject-matter of his science. The work he did is incomplete, but it forms a sure foundation to future laborers in the same field. It is universally recognized as an enduring monument of learning and genius, and it entitles its author to take rank with Hobbes and Bentham, as one of the three Englishmen who have made contributions of importance to the philosophical study of law. A. said of himself that his special vocation was that of "untying knots"—intellectual knots; and it was so. He set himself to the task of exposing the errors hid under the phrases and metaphors current among writers on law, and this he accomplished with such skill and subtlety as to make his works models of close and sound reasoning. In education, they now perform a most important part—that of disciplining the mind of those who devote themselves to the study of law and of the mental sciences generally in the difficult art of precise thought; and in this way they exercise an influence it is scarcely possible to overestimate on the rising generation of lawyers, publicists, and statesmen.—See Memoir of A. prefixed to the *Lectures on Jurisprudence*, and an article on A. in J. S. Mill's *Dissertations and Discussions*.

AUSTIN, Jonathan Loring, 1748–1826. He was b. in Boston, a graduate of Harvard, joined in the revolution, and was secretary of the Massachusetts board of war. In 1777, he was one of the commissioners sent to Paris to announce the capture of Burgoyne. Franklin employed him as an agent in England, and on his return in 1779, he was rewarded by congress. The next year he sailed for Spain as agent of the colonies, but was captured and taken to England, though soon afterwards liberated. He was secretary and treasurer of the new state of Massachusetts.

AUSTIN, Moses, d. 1821; a Connecticut pioneer in Texas. He took his family to the west in 1798, and from 1800 to 1820 was engaged chiefly in lead-mining. While at Bexar, Texas, he got permission from the Mexican commandant to colonize 300 families, and soon began the work, which was more fully carried out by his son.

AUSTIN, Samuel, D.D., 1760–1830; b. Conn.; a Congregational clergyman, who graduated at Yale; studied theology, and was ordained in 1786 as pastor of a church at Fairhaven. In 1790, he took charge of the First church in Worcester, Mass., and in 1795 was chosen president of the university of Vermont, where he remained six years. He

returned to Worcester in 1825. In the closing years of his life he was slightly deranged. He published several religious works.

AUSTIN, Mrs. SARAH, wife of John Austin, is well known as the translator of many of the best contemporary French and German works. She belonged to the Taylors of Norwich, a family remarkable for the men and women it has produced distinguished by literary and scientific ability. A faithful and devoted wife, she spent a great many years with her husband abroad, and she enjoyed the friendship of many of the most eminent persons in continental society. Mrs. A. translated from the German, *Characteristics of Goethe*, by Falk, etc., with notes (1833); *Fragments from the German Prose Writers*, with notes (1841); and *The Story without an End*, by F. W. Carove (several editions). She also translated from the German, Ranke's *Popes of Rome* and his *History of Germany during the Reformation*. Such is the excellence of these works, that they have been commended by the best judges as deserving to retain a place in English historical literature. Mrs. A. translated from the French, M. Cousin's *Report on Public Education in Prussia* (1834), and M. Guizot's work on *The English Revolution* (1850). She published in 1839 a work *On National Education;* and in 1857, *Letters on Girls' Schools and on the Training of Working-women*. From 1861 to 1863, she was engaged in editing her husband's lectures from his manuscripts, a duty she discharged with very great ability. She d. at Weybridge, on the 8th of Aug., 1867.

AUSTIN, STEPHEN F., d. Dec., 1836; son of Moses, and head of the Texan colony founded by his father. The colony occupied the site of the present city of Austin. Though much annoyed by Indians, he made it successful, and it received many accessions until the Americans became so numerous that they held a convention in Mar., 1833, to form a government for themselves. Without heeding the Spanish population, they agreed upon a plan, and A. took it to Mexico to receive its ratification, but there were so many revolutions on foot that he did not get a hearing. Then he sent a letter to Texas, recommending the Americans to unite all the settlements and municipalities and organize a state. This cost him three months' imprisonment, and longer surveillance; but in 1835 he returned to Texas and took command of the small revolutionary army. He induced Sam Houston to take the chief command, while A. went as commissioner to the United States, and prepared the popular mind to receive the new republic of the lone star. Before his mission was successful he returned to Texas, where he died.

AUSTIN, WILLIAM (or BILLY); the half-witted boy of Deptford who was reputed to be the son of queen Caroline; though she was legally acquitted of the charge, she kept him near her. In 1830, he was sent to a lunatic asylum in Milan, and came back to England in 1845. After a medical examination, at the request of his guardian, he was ordered to a private asylum in London.

AUSTRALASIA, a term etymologically equivalent to *Southern Asia*, but according to usage different. While *Southern Asia* vaguely means the lower regions of that continent, A. definitely indicates those large, or comparatively large, islands which, lying between the Malayan or Indian archipelago and Polynesia proper, are at once rounded off in collective position from the former, and distinguished in individual magnitude from the latter. The islands in question are chiefly Papua or New Guinea, Australia, Tasmania, New Zealand, New Caledonia, New Hebrides, New Ireland, and New Britain—all to be again noticed in their places. Though the name is not in general use, yet it seems necessary to a satisfactory system of geographical classification. In its entire extent, A. cannot be much less than Europe.

AUSTRALIA, the s.w. division of Australasia. By some, it is strictly defined to be an island—as, indeed, may either of the masses of land called the old and the new worlds—while by others it is loosely described as a continent. It is bounded on the w. by the Indian ocean; on the n., by Torres strait; on the e., by the Pacific; and on the s., by Bass's strait. It extends in s. lat. from 10° to 39°, and in e. long. from 113° to 154°; while its longest dimensions, as incidentally noticed under the head of AMERICA, may be said to run respectively on a meridian and a parallel. The parallel in question is that of about 25°, nearly the mean lat. of A.; and the meridian is that of 142° or 143°, nearly the mean long. of Australasia—a meridian, too, which, when produced in either direction, seems to mark out both Tasmania and Papua as geological continuations of Australia. In English measure, the greatest breadth from n. to s. is upwards of 2000, and the greatest length from e. to w. nearly 2600 miles. Of the resulting rectangle of 5,205 000 sq.m., A. comprises more than a half, perhaps four sevenths, or, in all, about 2,970,000 sq.m.—half the area of South America, as the next larger continent, or ten times that of Borneo, as the next smaller island.

In the mutual relations of itself and the ocean—a point of vast importance to so large a mass of land—A. is decidedly inferior to every one of the grand divisions of the globe. It is not indented by the sea, as is North America on the e., or Asia on the e. and s., or Europe on all sides but one. Again, as to navigable channels between the coast and the interior, A. is not to be compared even to Africa with its Nile and its Zambezi, its Niger and its Congo, its Gambia and its Senegal, and its many smaller arteries of communication besides.

Among the indentations of the coast, the gulf of Carpentaria, on the n.e., the only one of considerable magnitude, does, it is true, penetrate inwards about 500 m. from

cape York on the e., and about 400 from cape Arnhem on the west. This opening is entirely surrounded by tropical regions, rendered suitable for colonization by the frequent and moderate rains. In connection with the construction of the overland electric telegraph from Adelaide, through the heart of the continent, to Port Darwin on the gulf of Carpentaria, distant 2000 m.—effected by the government of South Australia, and opened in 1872—settlements have taken place in territories very different from what earlier observations seemed to indicate. For, saving the desert lying in the center in lat. 27° to 25° s., the interior of Australia is found to be covered with soil more or less fertile, in which, except during periodical droughts, that sometimes reduce the surface to a condition not unlike that of a beaten road, the rain-fall is sufficient to revive the dormant germs of vegetable life, and to clothe the country with grass; while, occasionally, the fall of rain is so great as to transform the whole of a plain, as far as is visible, into a sea, on the disappearance of which, in a wonderfully short time, the ground becomes covered with verdure. The other inlets put together are scarcely equal in size to the gulf of Carpentaria alone; while, strictly speaking, most of them are rather mere bends in the coast-line than actual arms of the ocean. Of the secondary inlets, the two that cut deepest into the land are the gulf of St. Vincent and Spencer gulf, in the south. Of harbors, properly socalled, there is a remarkable deficiency; and this deficiency is all the more important from the dangerous character of the reef-girt shores. As to fluvial communications between the coast and the interior, they can, with a single exception, hardly be said to exist at all. The interior and the coast are alike unfavorable to the production and maintenance of regular and permanent streams. The interior—comprising the whole mass within a border of not more than 100 m. in average width, and representing, in proportional size, the plate of a mirror with the scantiest possible breadth of frame round it—sends, as a general rule, hardly any tribute to the ocean. So far from possessing any reservoirs for the supply of rivers, its only large body of water, the brackish pool or salt marsh, according to circumstances, of lake Torrens (q.v.), is the landlocked receptacle of at least one of its principal streams. With the single exception of the Murray, and perhaps its southern affluents, even such inland water-courses as do conduct their surplus to the sea, lose each a large proportion of its volume through evaporation and absorption. With regard to the coast streams, again, the mountains, which form the dividing ridge, being, in general, only about 100 m. from the sea, the streams are for the most part, from their shortness, of comparatively insignificant size. This is more peculiarly the case on the s.—for the Murray, as flowing from the inner slope of the maritime ridge, is no exception to the general rule. To the w. of the Glenelg, which empties itself into the Southern ocean, between capes Northumberland and Bridgewater, the coast yields not a single river worthy of the name; while the entire line between Streaky bay and cape Arid—a stretch of 10° of long. on the Great Australian Bight—pours, incredible as it may seem, not a single drop of fresh water into the Southern ocean.

But the poverty of Australian hydrography is aggravated by the singularities of the so-styled "weatherology." An alternation of more or less rainless and rainy periods is characteristic of the Australian skies. The rivers undergo a similar alternation of drought and flood, the one state being, within certain limits, almost as destructive as the other. Even in these inequalities there is great irregularity. During the period of drought, a river presents a succession of phases—a scanty, though still regular stream; nearly stagnant ponds with a connecting thread of water between them; detached "water holes" in all the gradations of a constantly decreasing depth; moist pits that may yield their buried treasure to the spade; and, lastly, parched hollows where the labor of digging may be expended in vain. In the drought, for instance, from July, 1838, to Aug., 1839—during which "not a drop of rain fell in Sydney"—even the Murray, generally described as the only permanent river of any magnitude in the country, dwindled away into a chain of pools; and a recent explorer in western A. found on the bed of a large river—an *affluent*, if it may be so called, of the thoroughly broiled and baked Murchison—the indubitable footprints, then 3 years old, of preceding explorers. The flood, again, varies as widely, if not so definitely and gradually, as the drought. To select what may be regarded as an average instance from a list of the floods of the Hawkesbury in New South Wales: the torrent, at the end of July and beginning of Aug., 1808, rose to a height of 86 ft., or fully 50 above the edge of the bank, destroying the uncut crops of the settlement, and sweeping away stacks of wheat and great quantities of stock of every description. More than 60 such visitations appear to have been ascertained and recorded within the historical period, now extending over 80 years, of which about a third occurred in winter, the remainder being distributed in not very unequal proportions between spring, summer, and autumn, and that without the exemption of any one of the twelve months of the year.

The rivers of the e. coast—the Brisbane, Richmond, Clarence, Macleay, Hastings, Manning, Hunter, Hawkesbury, and Shoalhaven—are, in general, towards their mouths, tidal streams, flowing between high banks through a comparatively level region. Some of those of Victoria—such as the Glenelg—spring from a moist and undulating tract of country; while most of the others rise among the lofty ranges and snowy peaks of the Australian Alps—the coldest section of the bordering mountains by reason both of their altitude and of their distance from the equator. They are subject to frequent freshets in winter, and are less eccentric than the other rivers of A. in general. To the w. of

the Glenelg, as stated above, rivers may be said almost to disappear. South A. possesses only a few inconsiderable streams, and a number of usually dry torrent-courses; and as to the Great Bight, still further to the w., more than 500 m. of the coast have been already characterized as utterly waterless. To the w., again, of cape Arid, the coast presents only a few small lakes and inconsiderable water-courses, but nothing worthy of the name of river. On the w. side of A., the Swan river is by far the largest of the water-courses. Generally speaking, the whole of them are fed almost solely by the winter rains, many of them, during the dry season, either disappearing through a great part of their course, or dwindling into a series of detached pools. Along the remainder of the w. coast, no rivers worth notice have yet been discovered. Nor yet along the n.w. have any been found, excepting a few small ones towards Cambridge gulf. The rivers of this neighborhood much resemble in character those of the opposite angle in the colony of Victoria. They rise at no very great distance from the sea. Near their sources they are mere torrents; but in the lowlands their generally slow currents wind through fertile plains and valleys, which are subject to sudden and terrific inundations. In North A. are several comparatively considerable rivers—the Victoria, the Flinders, the Roper, and the Albert. They are wide streams, rising in the elevated region of the interior, and traversing a rugged country, which is often flooded. Lastly, along the n.e., the streams are distinguished by their length, a distinction which they owe to their being parallel with the coast. They are the Mitchell, Lynd, Burdekon, Mackenzie, Dawson, Fitzroy, Belyando, etc.; the whole of them, with the exception of the two last named, having been discovered by Dr. Leichhardt. To pass from the rivers of the coast to those of the interior, we must confine ourselves to two of the latter—Barcoo or Victoria, and the Murray with its numerous tributaries. The upper part of the Barcoo was first discovered by Sir T. Mitchell, in a broken district, lying 300 or 400 m. from the e. coast, and nearly on the tropic of Capricorn. Its broad reaches might there have floated a steamer. Since then, it has been traced by Mr. Gregory through a solitary course into lake Torrens, though, in point of fact, it is only from time to time that it actually has a surplus to pour into its receptacle. The system, again, of the Murray and its tributaries is vastly more complex. Rising on the w. or inner slope of the Australian Alps, it flows to the w.n.w. with a plentiful stream, which alone in the country, after the fashion of a tropical river, rises and falls regularly according to the season; and, though inacessible to ships of any size from the sea, it has an internal navigation of about 2000 m. in length. On its left or southern side, it receives several considerable streams, such as the Ovens and the Goulburn. But it is on the right or northern side that the basin of the Murray is most peculiar. The principal affluents in this direction are the Murrumbidgee and the Darling. The Murrumbidgee, to which the Lachlan, only less "mysterious" than the Darling, contributes such surplus as it from time to time may have, forms the chief strand of a complicated net-work of water-courses. The Darling, after it has received all its tributaries, pursues its lonely way for 660 m., sending off branch after branch to lose themselves in landlocked lagoons. Nor is its growth less curious than its lower channel. The whole of the interior drainage of the maritime ridge of New South Wales between lat. 25° and lat. 34°, a stretch of about 625 m., converges into a vast basin of clay, on the 30th parallel, where the Balonne, Dumaresque, Gwydir, Namoi, Castlereagh, Macquarie, and Bogan, after spreading out in spacious marshes, and amid complicated junctions and bifurcations, unite such surpluses as absorption and evaporation may have left them to form the "mysterious" Darling.

Such being the hydrography of A., the investigation of the interior, so far as it has hitherto advanced, has been conducted almost entirely by land. In 1844, Sturt penetrated to the center of the country, between Spencer gulf on the s., and the gulf of Carpentaria on the n., meeting sterility and drought. In 1847, Leichhardt, encouraged by the success of his previous expedition from Sydney to Port Essington, started from Moreton bay on the e., for western A., following a sort of diagonal of nearly the greatest possible length; and, as was to be dreaded, he must have failed in his bold enterprise; for neither of himself nor of his companions has any intelligence ever been received. Subsequent explorations made by Stuart (1858–62), Burke and Wills (1860–61), and by expeditions in search of them, have resulted in the discovery that this interior of the Australian continent is, on the whole, well fitted for pastoral, and, in many places, for agricultural purposes. See AUSTRALIAN EXPLORATIONS. Any detailed view of the climate, besides being equally difficult and unsatisfactory with respect to so vast an aggregate of latitudes and longitudes, has been rendered comparatively unnecessary by the incidental allusions to the subject in the preceding paragraphs. The following are tabular statements extracted from local publications:

MEAN ANNUAL RAIN-FALL.

Locality.	Latitude.	Rain-fall.
Brisbane, Queensland, lately Moreton bay	27° 1′	35.92 in.
Port Macquarie, New South Wales	31° 25′	70.79 "
Sydney, New South Wales	33° 51′	49.00 "
Port Phillip, Victoria Colony	38° 18′	29.16 "
Lake Alexandrina, mouth of the Murray	35°	17.45 "
Adelaide, South Australia	34° 55′	19.90 "
York, West Australia	31° 53′	25.39 "

FREQUENCY OF RAINY DAYS.

Month.	Adelaide.	Port Phillip.	Sydney, South Head.	Port Macquarie.
January	4	6	13	11
February	4	5	12	11
March	5	7	13	12
April	10	11	12	12
May	10	13	12	11
June	11	11	12	9
July	14	12	13	9
August	15	14	11	8
September	11	12	11	9
October	10	12	12	10
November	6	10	11	9
December	5	7	11	9
Whole year	105	120	143	120

The mean temperature of Melbourne is 59°, being about 9° higher than that of London. The warmest month is Jan., the mean of which is 68°; the coldest is July, 49°.34. The corresponding temperatures of London are 63° and 36°.

Geology.—The little that is yet known of the geology of A. has been chiefly obtained from occasional notes scattered through the journals of scientific travelers. So utterly unknown were the mineral treasures of this continent, that it was only comparatively lately, and by the merest accident, that the Burra Burra copper-mines were discovered. In 1851, farmers were turning up with the plow the auriferous alluvium; pebbles of gold-bearing quartz were used for garden-walks; and we have heard of an Oxford graduate who ornamented his garden-walls by building into them masses of white quartz variegated with portions of the unrecognized yellow metal. In 1846, when count Strelecki submitted to Sir R. Murchison a series of rock and mineral specimens gathered in southern A., the practiced eye of that veteran in geology recognized in them a remarkable resemblance to the rocks in the auriferous districts of the Ural mountains, which he had thoroughly explored. He could not ascertain that gold had ever been found in the colony, but so certain was he that the precious metal existed, that he printed and circulated amongst the miners of Cornwall a paper urging them to emigrate to New South Wales, and seek there for gold, as they had been accustomed to seek for tin and zinc among the alluvial débris of their own hills. After a few years, in the researches of Mr. Hargreaves, and the diggings that followed, this remarkable prediction was fulfilled to an extent that could not have been anticipated. This narrative is of much value, as showing that geology is no longer in the hands of empirics; that its truths have been so gathered and arranged as to afford bases for safe inductions; and that, when rightly used, this science is of the first importance, even when tested by the utilitarian *Cui bono?* of the age. Recognizing this, the colonial governments of A. have appointed state geologists, who have begun their examination of the Australian continent, and have published several reports.

In looking at the continent as a whole, it will require not many broad touches to convey all that is at present known. An immense, roughly quadrangular and comparatively flat district in central A., extending from the southern shores in lat 33° s., where it forms a coast-line of somewhat bold cliffs, to 18° s. lat., and having for its eastern and western limits 124° and 138° e. long., is composed of *tertiary* rocks. The superficial characteristics of this vast almost unpeopled tract have already been described. Nothing more is known regarding its structure. Three other patches of tertiary rocks exist. The largest is a broadish tract, which forms the coast of western A. northwards from the colony of Perth, as far as the tropic of Capricorn. The second occupies a considerable portion of the valley of the Murray river, in that district known as lower Darling. The last and smallest patch covers the southern slope of the Australian Alps, extending along the shore from Wilson's promontory to cape Howe.

The immense central expanse of tertiary beds is surrounded by a continuous belt of *plutonic and metamorphic rocks*, only broken on the southern shores, where it forms the coast-line, and where the sea has indented it, forming a bay which has for its boundaries the more enduring primitive rocks. This crystalline belt is, on its e., n., and western sides, separated from the sea by a tract of land having a nearly equal breadth of 100 m. throughout its course. Tracing this from its southern termination in western A., we find a limited region of palæozoic rocks occupying the colonized district around Perth, and containing valuable coal-beds. Northwards, as already indicated, the coast-line consists of tertiary rocks. From their termination in lat. 23½° s., the rocks along the whole western and northern shores are composed of secondary strata. On the eastern shore, from cape York to the western boundary of Victoria, the formations belong to one or other of the primary series. Through the whole extent of this boundary tract, whether consisting of tertiary, secondary, or primary strata, numerous and often extensive patches of igneous rocks exist which have been erupted during the tertiary or post-tertiary epochs.

About 100 m. from the bounding tract of palæozoic rocks on the eastern limits of A., and running parallel with it, there is an equally broad strip of similar strata extending from the shores of the gulf of Carpentaria to Bass's strait. These two regions, which unite together and are largely developed in the southern portion of Victoria, supply the great store of Australian mineral wealth. The veins which intersect these strata were the original matrices of the *gold*. It has not, to any extent, been sought for in this, its original position, from a belief that the amount of metal decreases as we descend in the solid rock. Mr. Selwyn, colonial geologist for Victoria, has, however, lately reported in favor of quarrying for the gold in the solid rock. The greatest amount of gold is found in the heaps of débris or old alluvium derived from the denudation of the old slaty rocks. The auriferous rocks of eastern A. are lower silurian, as shown by Messrs. Lonsdale and Salter, from the examination of specimens of pentameri, trilobites, and corals from the strata which overlie them. Mr. Selwyn has referred the Victoria gold-bearing strata to the same age, from the occurrence in them of about 60 species of lower silurian fossils, including trilobites, graptolites, and lingulæ. The auriferous quartzose veins are most abundant in the vicinity of eruptive rocks, whether granite, porphyry, or greenstone.

Messrs. Selwyn and Rosales have shown that the superficial drifts containing the gold consist of three distinct stages. The lowest or oldest contains the remains of wood and seed-vessels differing little from the present vegetation; among them the cones of banksia, an exclusively Australian genus, have been identified. The remains of animals exhibit also the representatives of the living fauna of the country. Gigantic marsupials then existed—kangaroos, potoroos, and wombats—representing the elephants, and even the large carnivora of Asia; but with the exception of the mastodon, of which one species has been found in A., there were, it would seem, no generic forms common to this great district and the rest of the land in the eastern hemisphere. In Victoria, these beds of alluvium have been overflowed and even interlaced by basaltic *coulées*, which evidently proceeded from terrestrial volcanoes, inasmuch as the vegetable matter beneath them has been charred and destroyed *in situ* by the eruption.

An extensive *coal-field* has been known for some time as occupying the whole of the great basin of the Hunter river and its tributaries, down to the sea-coast at Newcastle, where several beds crop out on the beach. For a good many years, the monopoly held by the Australian Agricultural Company, in the working of the coal, has ceased to exist, and as the result, the trade has increased enormously. From Port Hunter the coal is dispatched to all parts of A., and even to New Zealand and California. Beds belonging to the carboniferous system have been discovered also in western A., near Perth, and the coal has been successfully, though not so extensively wrought there.

After gold and coal, the next most important Australian mineral is *copper*. The Burra Burra mines, in South A., were discovered in 1842. The lode is 17 ft. wide, and of vast extent. The ore contains 75 per cent of metal, and is quarried out like stone in immense masses. Copper has also been wrought for several years at Bathurst, in New South Wales. The poorest ores are here most abundant, the rich pyrites existing only in small quantity. Copper is now mined and smelted in western Australia.

Iron is spread in great profusion over all the continent. To such an extent does it exist in several of the mountains on the north coast, that they violently affect the magnetic needle. At Berrima, in New South Wales, an oxidulated iron ore, from which is manufactured a good steel, has been worked, but not successfully. Iron has been noticed in quantity in both southern and western Australia.

Lead is most abundant e. and s.e. from Adelaide, at Mt. Beevor, and near cape Jervis. The ore of Glen Osmond mines, near Adelaide, yields 75 per cent of lead, besides a proportion of silver. This metal is also wrought at Geraldine, in western Australia.

Manganese, bismuth, tin, and antimony have been met with in South A., as also good specimens of jasper, chalcedony, and opal.

Zinc and quicksilver are mentioned as occurring in western Australia.

Botany and Zoology.—The natural history of A. is remarkably different from that of any other quarter of the globe. Its trees—which seldom form dense forests, but are scattered as in a lawn or park, where the colonist finds pasture for his flocks without any previous clearing—are, almost without exception, of very peculiar appearance. Among the largest of them are species of *eucalyptus* (q.v.), some of which attain the height of 150 or 200 ft., rising without branches to at least half their height, their stately stems resembling beautiful columns. Some of the eucalypti, on account of their resinous exudations, are known to the colonists as gum-trees. Their leaves are leathery. It is, indeed, a general characteristic of the trees and shrubs of A., that their leaves are evergreen and of a firm texture; and although in this a beautiful adaptation may be perceived to the prevailing dryness of the climate, the foliage wants the delicacy and the liveliness of tints which in other countries form so much the charm of the landscape. The *casuarinæ* (see CASUARINA) or cassowary-trees (beef-wood, she-oak, swamp-oak, etc.), among which, as among the *eucalypti*, are some of the largest and most useful timber-trees, are still more singular in appearance; their long, wiry, jointed branchlets, which greatly resemble those of *equiseta*, are quite leafless, having only very small sheaths instead of leaves. Equally destitute of foliage are the greater number of the *acacias* (q.v.), which abound in the Australian flora. The abundance of *proteaceæ*—

which order includes the genus *banksia*, already noticed in the geology—connects the flora of A. with that of the cape of Good Hope, to which there are also other points of resemblance; and although true heaths do not appear, their place is supplied by a variety of heath-like plants of other natural orders, and particularly of the order *epacridaceæ*, of which some (of the genus *epacris*) now take their place with heaths among the favorite ornaments of our greenhouses. *Araucarias* (q.v.) form a connecting link between the flora of A. and that of Chili. In the more northern parts, palms and other tropical productions connect it in like manner with that of the s.e. of Asia.

Few of the trees or shrubs of A. produce edible fruits, and those known as Tasmanian currants, Tasmanian cranberries, etc., are not of much value. The seeds of the araucarias are edible, having some resemblance to almonds. Almost none of the native vegetable productions of A. have been found worthy of the care of the gardener, except as objects of beauty or curiosity; and it produces no plant which has yet found its way, or seems in the least degree likely to find its way, into agriculture—unless, indeed, some of its pasture plants may prove to be peculiarly adapted to dry climates. But the cultivated plants of other countries have been introduced with great success by the colonists, and their gardens boast not only of the fruits common in England and the south of Europe, but of some of those of China.

The zoology of A. is particularly characterized by the prevalence of marsupial (q.v.) quadrupeds, of which comparatively few exist in any other part of the world. Some of them are herbivorous, as the kangaroos (q.v.), potoroos (q.v.), and wombats (q.v.); some feed indifferently on roots and insects, as the bandicoots (q.v.); some are carnivorous, as the thylacine (q.v.) and the dasyure (q.v.)—the *tiger* and the *wild cat* of the colonists—but all are marsupial; that is, the females have a pouch for the young, which are born in a much less advanced state than the young of other viviparous animals. Besides its marsupial quadrupeds, A. has few others, yet known, except some species of bat; a kind of dog, known as the dingo (q.v.); and the *echidnas* (q.v.) and duck-bills (*ornithorhynchus*) (q.v.), animals which have been regarded as forming a connecting link between quadrupeds and birds, both upon account of external form and anatomical structure, and to which nothing at all similar exists in any other part of the world.

Many of the birds of A. are very beautiful, but they do not exhibit peculiarities so general and striking as its quadrupeds, or even its plants. The emu (q.v.) may be regarded as the Australian representative of the ostrich and cassowary. The black swan is chiefly remarkable for its color. Ducks of various kinds, falcons, doves, parrots, and many other birds of families well known elsewhere, connect the natural history of this isolated continent with that of the other regions of the globe.—Reptiles are numerous, but exhibit as a class no very marked peculiarities, nor is there in any other department of zoology so wide a difference from the rest of the world as in the mammalia. Among the fish of the Australian shores and rivers are many species which are not found elsewhere, but they present no remarkable common characteristic. Among them are no trouts, salmon, or other *salmonidæ*, which, indeed, do not extend into the southern hemisphere. Attempts to export ova to A., and colonize her waters with salmon, have not been successful.

As to the cultivated productions, wool may be reckoned the grand staple of Australia. For sheep-farming, the country, so far as it is not a desert, seems to be admirably adapted. The colonist, instead of having, as in America, to hew his way through dense forests, with tangled underwood, sees around him either open pastures or park-like woods overshadowing their green sward. His main difficulty is the scarcity of water, or rather the possibility that such a scarcity may occur. Wheat is grown to advantage, particularly in South Australia; cotton, tobacco, and sugar are produced in New South Wales and Queensland; the vine is grown extensively by the colonists, who have begun to avail themselves of the capabilities of the respective colonies by rearing the productions of tropical and temperate climates, both of which are possessed by Australia.

History.—In 1606 the north coast was descried by the Dutch on board of the *Duyfen*, and about the same time by a Spanish expedition sent from Peru in 1605, one of the commanders of which gave his name to Torres Straits. It is probable, however, that A. had been long known to the Chinese. In 1619 and 1622 respectively, the west and south-west coasts were seen. In 1642 the island, called for some time Van Diemen's Land, but now Tasmania, was visited by Tasman, who, within a month, sighted also New Zealand. In 1697, Swan river was discovered by Vlaming. In 1770 Cook, then on his first voyage, explored nearly the whole of the east coast, designating the same New South Wales. In 1798 Bass, a surgeon in the navy, ascertained the separation of A. and Tasmania, by passing through the strait that bears his name. In 1802 Port Phillip was entered; and in the same year, Flinders pretty nearly completed the general outline by sailing along the southern shore. To pass from discovery to colonization: there was established, in 1788, the settlement of New South Wales, and from this all the other British Australian settlements, with the exception of Swan river, have successively been planted. Norfolk island, erected, in 1790, into a penal settlement for New South Wales, was in 1856 allotted to the descendants of the mutineers of the *Bounty*, most of whom were removed for this purpose from Pitcairn's island. The other colonies, whether offshoots or not of New South Wales, assumed an independent existence in the following order: Tasmania, 1825; Western A. or Swan river, 1829; South A., 1834; New Zealand, 1841; Victoria,

1851; and, lastly, Queensland or Moreton bay, 1859 (see these heads). Besides these flourishing colonies, a settlement was established near Port Essington in 1839, but was abandoned in 1845, on account of the unhealthiness of the climate. Subjoined is a summary table of statistics for all the more important of these dependencies, not including those incipient settlements that have been effected along the course, and at the terminus, of the overland line of telegraph.

The native population of A. belongs to the race or group of tribes variously designated as *negritos, Austral negroes,* or *kelænonesians* ("black islanders"). The chief members of the group, besides the Australians, are the papuans of New Guinea, New Caledonia, and New Hebrides, and the natives of Tasmania. See ETHNOLOGY, NEGRITOS. The Tasmanians are now extinct, and the Australians are rapidly diminishing in number; their condition will be considered under the head of each colony. In Victoria they still number 1330 (not included in the foregoing table). The 38,540 natives of New Zealand (also not included in the table) belong to the Polynesians (q.v.).

AUSTRALIAN EXPLORATIONS. Since the article AUSTRALIA in the first issue of the *Encyclopædia* was written, additional information collected by various exploring expeditions has largely modified the opinion formerly entertained with regard to its interior. The expedition of Sturt from South Australia to the center of the country in 1845, dispelled the notion of a great inland sea, but it substituted the much less hopeful one of a vast and burning lifeless waste; and this opinion appeared to be corroborated by the fate of the gallant Leichhardt, who, after his successful overland journey from New South Wales to Port Essington in North Australia, started in 1847 to traverse the island from Queensland to Western Australia, and was never more heard of. It was for a time universally considered as decided that a million of sq.m. in the interior was hopelessly barren, and in consequence further explorations were abandoned. However, in 1858, John M'Douall Stuart, a companion of Sturt in his travels, having made a short expedition to the n.w. of the colony of South Australia, brought back the cheering news that a very extensive tract suitable for colonization existed in that quarter, well supplied with lakes and running "creeks," and presenting millions of acres of excellent pasture. Despite, therefore, the arrival of Gregory in the same year from the n.e. of the colony with additional unfavorable reports, Stuart resolved to resume once more the exploration of the interior from s. to n.; and, starting from South Australia in 1860, he held a generally n. by w. course, till his further progress was stopped by the threatening aspect of the natives, at a point in lat. 18° 17′ s., long. 134° e. Returning with his two companions to organize a stronger force, he retraced his steps (1861) on the previous track; but, after traveling 100 miles further than before, was baffled by an impenetrable scrub, through which he in vain sought a passage. Want of provisions forced him to return a second time; but nothing daunted he started once more in 1862 along the now familiar path, and on July 24th of that year stood on the shore of the Indian ocean at Van Diemen's gulf. Mr. Waterhouse, the naturalist, who accompanied Stuart in his third expedition, divides the country passed through into three regions: the first, extending as far n. as lat. 27° 18′ s., is watered by springs and is suitable for pastoral purposes, though subject to great heat and drought in summer. The springs either issue from the surface of the plains or from the tops of curious conical eminences evidently of volcanic origin; these eminences varying from the size of a beehive to a considerable hill. The second region, extending northwards to lat. 17° 36′ s., is much more defective in water-supply, and its vegetation chiefly consists of a pungent-flavored coarse grass, known as "porcupine grass" (otherwise *spinifex* or *triodia pungens*), good pasture being only found in the hollows of creeks. This region also presents several ranges of hills of low elevation, the maximum height being 2000 feet above the plain. The third region, which extends from lat. 17° 36′ s. to the sea-coast, possesses a rich soil, sometimes lacustrine and sometimes alluvial, clothed with the usual abundance of tropical vegetation, and well timbered.

The resumption of the exploration of interior Australia by Stuart had the effect of arousing general attention to the subject in the other colonies; and accordingly, while Stuart was on his 1860 expedition, the colony of Victoria was fitting out another party for the same purpose. This expedition, which was put under the command of R. O'Hara

Burke, consisted of a large party with a number of camels (which had a short time previously been imported by the Victorian government from India), and left Melbourne on Aug. 20, 1860, reaching Cooper's creek in the middle of December. Finding that his company was too numerous and too much encumbered, Burke left the greater portion at the creek under Brahe, to await his return, and with his second in command, William John Wills, and two others, Gray and King, started, with 6 camels, 1 horse, and 12 weeks' provisions, in a northerly direction, reaching the mouth of the Flinders river, at the head of the gulf of Carpentaria, on Feb. 11, 1861, being the first explorers who crossed Australia from sea to sea. Unable, however, to obtain a view of the ocean, on account of the extensive marshes which skirt the coast-line, they commenced their return journey, and, arriving at Cooper's creek on April 21 found, to their astonishment, the camp completely deserted. From indications marked on a tree close by, they were induced to dig at its foot, and found a small supply of provisions, and a note to the effect that the party in waiting had left Cooper's creek to return home; the note being dated April 21, the very day on which the exhausted explorers reached the camp, and having been only seven hours written when read by Burke. In their worn-out condition, it was a hopeless task to think of following this fresh party to the river Darling through 400 m. of desert, though, had they done so, they would have met Brahe returning with a third section of the expedition, which he had met at the Darling, and led back to Cooper's creek, reaching it on May 8, but retracing the road to the Darling, on finding (after a very slight examination) no signs of Burke's party having arrived there; so Burke, resolving to gain the nearest pastoral station of South Australia, 150 m. distant, the three travelers (Gray had already succumbed to fatigue and famine) pursued this new route at the rate of 4 to 5 m. per day, till want of water compelled them to return to the Cooper, though, had they known that the station they sought was not more than 50 (instead of, as they thought, 100) m. off, they might by a strong effort have reached it, and been saved. Instead of this, they returned to Cooper's creek; and their camels being now all dead, and their provisions nearly exhausted, they resolved, as a last resource, to seek out some camp of natives, where they might remain till assistance reached them from the colony. But their limbs were growing feebler and feebler; at last, on June 28, Wills lay down to die, requesting the others to go on; and on June 30, Burke also succumbed. King, the sole survivor, succeeded in reaching the natives, with whom he lived for 2½ months, till a party under Howitt, which was sent out from Victoria in quest of Burke and Wills, arrived at the creek, and rescued him. Burke's experiences of the interior are, as far as we can gather from the scanty records, equally favorable with those of Stuart. He found some good grassy country n. of the Cooper, then passed through a sandy and stony district; but from the tropic of Capricorn to the sea, a large proportion was richly clad with verdure and well watered, with now and then a range of hills traversing it.

The unaccounted-for absence of Burke and Wills produced much excitement in the two southern colonies, and gave birth to three separate expeditions, with the view of bringing aid to the missing explorers. Two of these were fitted out by Victoria, and one by South Australia. The former two were intended to act in concert, and were sent round from Melbourne to Rockhampton, in Queensland, in the *Firefly* of 200 tons. At Rockhampton, Walker and his party were landed, in order to make the gulf of Carpentaria overland, while the brig pursued her voyage to the head of the gulf, and landed Landsborough and his party at the mouth of the river Albert, in the middle of Oct., 1861. On the 17th, Landsborough commenced his march, and following out his instructions to make for Stuart's "central" mount, followed up the Albert and Gregory rivers, and thence diverging more to the w., found that the water-supply had wholly failed. Turning then southwards along the river Herbert, his small party of three whites and two aborigines in all were compelled to stop in lat. 20° 11½′ s. by the menacing attitude of the natives, and returned to their dépôt on the Albert, which they reached on Jan. 19, 1862. Here they learned that Walker had arrived on Dec. 7; bringing the important news that he had found traces of Burke's party on the Flinders; and Landsborough accordingly resolved to penetrate in an easterly direction. On reaching the Flinders, he found all traces obliterated by the rains, but notwithstanding ascended the river for 280 m., then crossed to the Thompson, followed it up for the greater part of its course, afterwards striking out eastwards to the Barcoo or Cooper, and failing to reach Cooper's creek on account of the extreme drought, made for the settlements on the Darling, and arrived at Melbourne in Aug., 1862. Landsborough found the country between the gulf and the Thompson to consist of good soil thickly grassed; and, with rare exceptions, water was generally abundant.

The South Australian expedition was got up on a much larger scale, consisting of 8 men, 4 camels, 26 horses, 12 bullocks, and 100 sheep, and was put under the command of M'Kinlay, an experienced explorer. It started from Adelaide on Aug. 16, 1861, and on Sept. 24, had passed the furthest settlements of the colony; crossed the formerly mysterious lake Torrens, which was at that time a dry desert; and came into a district abounding with lakes and creeks, and luxuriantly clad with grass whenever the rain afforded support to animal life. Here it was learned that the fate of Burke and Wills had been ascertained, and the party then held northwards for the gulf of Carpentaria. Leaving the lake district, they entered the great desert, whose inhospitable nature had been so vividly described by Sturt 16 years before; but curiously enough, in a district

in which Sturt had almost perished of thirst, M'Kinlay's party were almost carried away by a flood. In lat. 25° s., they emerged on an extensive country, abounding in grassy plains, watered by rivers, and intersected by hill ranges; and in lat. 22° s. they entered upon a country of tropical character, reaching the Leichhardt, which they followed down till the deep and broad mangrove creeks and boggy flats which form a wide border round the beach of the gulf, hindered their further progress; so that, like all the preceding explorers, with the exception of Stuart, a glimpse of the ocean was denied them. From the Leichhardt river they then proceeded in an e. by s. course, reaching Bowen at Port Denison, in Queensland, in the beginning of Aug., 1862, and thence reached Adelaide by sea.

The results of these explorations of interior Australia agree in this, that there is a much larger extent of territory available for colonization than was formerly believed; that, in fact, by far the greater portion of the interior is more or less suitable for colonization, and that only to that portion of it lying in the center in lat. 27° to 25° s. can the term desert be with justice permanently applied. Yet Sturt's desert was certainly no fancy, and his route to the center of the interior was through a barren waterless waste, while M'Kinlay, who followed nearly the same track, was delighted with abundance of rich pasture and water. The truth seems to lie between the two extremes; Sturt's expedition was carried out during a year of unusual drought, while the recent expeditions here sketched took place during exceedingly moist seasons, the year 1861 and 1862 being the wettest the colonists of Victoria had ever known. Consequently, we should err in supposing the interior to be a mere desert on the one hand, or a blooming, well-watered expanse on the other. It is in reality a surface covered with soil more or less fertile; the basaltic rocks and clays being the most, and quartz, sandstone, and granite least fertile; and the rainfall is sufficient, in ordinary seasons, to revive the dormant germs of vegetable life, and cover the surface with a crop of grass more or less luxuriant. On the other hand, the occasionally long continuance of drought, accompanied with an excessive amount of evaporation, wholly dries up some streams, converts others into a series of pools, connected by threads of water, or "creeks," reduces extensive lakes to marshes or to shallow pools, in which the concentration of the soluble salts of the soil renders the water so brackish as to be wholly undrinkable, and restores the verdant surface for a time to the condition of a desert, herbage remaining only on the banks of creeks. The rainfall, which is the sole water-supply in the central districts, does not occur at regular intervals, but there is every reason to suppose that the excessive drought experienced by Sturt has not reappeared since 1845. Occasionally, the fall of rain is so excessive as to convert the whole of the plain, as far as the eye can reach, into a shallow sea, which, however, soon disappears by the drainage of the rivers and creeks, or under the influence of the excessive evaporation, and in an almost incredibly short period thereafter, the ground is clothed with verdure. The climate of the northern districts is very different; there we have a temperature even higher, but its effect on vegetation is rendered very favorable by the frequent and moderate rains.

These expeditions have also contributed a few facts respecting the rivers of North Australia. The Flinders was estimated by Landsborough to be fully 500 m., and the Albert 100 m. long; the Roper was found by Stuart to be a deep wide river at about 100 m. from its mouth; on the whole, the river system of North Australia is much more extensive than was formerly supposed.

In 1865, an expedition under the command of M'Intyre, was undertaken to ascertain the fate of Leichhardt, but it could not advance further than Cooper's creek.

Our knowledge of the interior of western Australia was considerably extended by the expedition which started from the west under Forrest in 1869; and the observations made during the construction of the overland telegraph line from Adelaide to Port Darwin, on the gulf of Carpentaria, confirmed the view that some of the interior of the island continent is fitted for agricultural purposes. The expeditions of Gosse and Warburton in 1873 explored part of the *terra incognita* w. of the central telegraph line. Forrest in 1874 again crossed the country from Perth eastward, reaching the telegraph lines in 27° s. lat.; waterless and treeless wastes were the distinguishing features. Giles in 1876 traversed the continent in a n.e. direction, finding the country to the eastward desolated with drought. H. V. Barclay in 1878 crossed the hitherto unknown country between Alice Springs on the telegraph lines and the e. boundary of South Australia, in e. long. 136° 30′. All the water-courses and creeks passed over were dried up, but some fine country was laid open. The view northwards in s. lat. 21° 50′, only disclosed sand ridges and spinifex.

AUSTRASIA, or the East Kingdom, the name given, under the Merovingians, to the eastern possessions of the Franks, embracing Lorraine, Belgium, and the right bank of the Rhine, and having their central point at Metz. At the time of the rise of the Frankish power, these districts were of great importance, as they formed the connection with the German mother-country, and were the most thickly inhabited by Franks. After the time of Charles Martel, the division of the Frankish kingdom into A. and Neustria lost its political importance. Under Charlemagne's successors, A. merged into Germany—and Neustria, or west Frank-land, into France.

AUSTRIA, ARCHDUCHY OF, the cradle and nucleus of the Austrian empire, lies on both sides of the Danube, from the mouth of the Inn to Presburg, on the borders of Hungary, and embraces an area of about 15,000 sq.m., with a pop. in 1854 of 2,624,237. It now forms three of the crown-lands, or administrative provinces of the empire—viz., lower and upper Austria (or Austria below, and Austria above the Ens), and the duchy of Salzburg. See AUSTRIA, EMPIRE OF. The s. and w. portions are mountainous; the n. and e. are more level and fertile, containing the great plain of Vienna, the Marchfeld, etc. The pop. is mostly German and Catholic. The chief towns, besides Vienna, are Wiener-Neustadt, Salzburg, Steyer, Linz, and Ischl (q.v.).

AUSTRIA, EMPIRE OF, or AUSTRO-HUNGARIAN MONARCHY. The Austrian dominions form a compact territory, with a circumference of about 5350 miles. The body of the empire lies in the interior of Europe, though it has about 500 m. of sea-coast on the Adriatic. A. borders on Italy, Switzerland, Bavaria, Saxony, Prussia, Russia, Roumania, Servia, Turkey, and Montenegro. With the sanction of the Berlin congress of 1878, the small territory of Spizza, on the Montenegrin frontier and formerly Turkish, has been incorporated with Dalmatia; the Turkish provinces of Bosnia and Herzegovina, though occupied and also administered by Austria, cannot of course be regarded as part of the Austro-Hungarian monarchy. The following table shows the area and population of the empire at the time of the census:

Crown-lands.	Area in Sq. Miles.	Population in 1869.
Lower Austria	7,563	1,990,708
Upper Austria	4,576	736,557
Salzburg	2,734	153,159
Styria	8,567	1,137,990
Carinthia	3,958	337,694
Carniola	3,811	466,334
Coast districts, or Illyria	3,048	600,525
Tyrol and Vorarlberg	10,980	885,789
Bohemia	19,822	5,140,544
Moravia	8,481	2,017,274
Silesia	1,964	513,352
Galicia	29,874	5,444,689
Bukowina	3,981	513,404
Dalmatia	4,881	456,961
Hungary	68,583	11,633,162
Croatia and Slavonia	18,432	1,168,037
Transylvania	23,147	2,115,024
Military frontiers	12,800	593,232
Total	237,202	35,904,435

A later estimate of the total area makes it just 240,000 sq. miles. In 1876, the pop. was calculated to have increased to 37,350,000.

This population comprises the military establishment, which, excluding the landwehr, was, at the end of 1876, on a peace footing, 271,757 men; and 777,496 on a war footing. The naval forces of Austria consisted, in April, 1876, of 47 steamers and 10 sailing-vessels.

The first eleven of these divisions—except a part of Illyria—and also part of Galicia, making an extent of 75,180 sq.m., with a pop. of above 12,000,000, formerly belonged to the German Confederation.

Surface.—Three fourths of A. is mountainous or hilly, being traversed by three great mountain chains—the Alps, Carpathians, and Sudetes (q.v.), whose chief ridges are of primitive rock. The Rhætian and Noric Alps stretch from Switzerland to the Danube, and contain the highest points of the Austrian territories, the Ortler Spitze rising to 12,779 English feet. Their height declines gradually towards the e., where the Leitha hills (3000 ft.), overlooking the plain of Vienna, form the transition to the Carpathians. This chain rises on the left bank of the Danube, near Presburg, and sweeping in a curve, first e., and then southward through Transylvania, again meets the Danube. The highest point is Butschetje, in Transylvania, where a height of 9528 ft. is reached. The central part, or Tatra mountains, are vast granitic masses, resembling the Alps in character; the highest of these is the Lomnitz, in the longitude of Cracow, 8133 feet. The Alps are accompanied, n and s., by parallel ranges of calcareous mountains, covering whole provinces with their ramifications. The Carpathians are lapped on their northern side by sandstone formations; mountains of the same character also occupy Transylvania. Springing from the n.w. bend of the Carpathians, the Sudetes run through the n.e. of Moravia and Bohemia, in which last the range is known as the Riesengebirge, or Giant mountains. The boundary between Bohemia and Prussian Silesia passes over the Schneekoppe, the highest peak of these mountains, which is 5275 ft. in height. Continuous with this range, and beginning on the left bank of the Elbe, are the Erzgebirge, or Ore mountains,

on the confines of Saxony; and veering round to nearly s.e., the range is further prolonged in the Bohemian-forest mountains, between Bohemia and Bavaria.—The chief plains of the Austrian empire are the great plains of Hungary (the smaller of these is in the w., between the offsets of the Alps and Carpathians, and is about 4200 sq.m. in extent; the other, which is in the e., and traversed by the Danube and the Theiss, has an area of 21,000 sq.m.), and the plain of Galicia.

From the gulf of Triest to the s. point of Dalmatia, A. has a sea-line of about 1000 m., not counting the coasts of the numerous islands, the largest of which is Veglia, 23 m. by 12. The chief lakes are the Platten see (about 400 sq.m.), and the Neusiedler see (about 100 m.), both in Hungary. The first is navigable by steamers, and both are rich in fish, and have fruitful vineyards around them. The Alps and Carpathians inclose numerous mountain lakes. The Long lake in the Tatra mountains lies at an elevation of 6000 feet. The most remarkable of all is the Zirknitz lake (q.v.) in Illyria. There are extensive swamps or morasses in Hungary. One connected with the Neusiedler see covers some 80 sq. miles. A good deal has been done in draining morasses.

The leading rivers that have navigable tributaries are: the Danube (q.v.), which has a course of 849 m. within the Austrian dominions, from Passau, at the mouth of the Inn, to Orsova, on the frontier of Walachia, and receives, on the right, the Inn, Traun, Ens, Leitha, Raab, Drau, and Save; and, on the left, the March, Waag, Neutra, Gran, Theiss, Bega, and Temes: the Vistula (q.v.), with its tributary the Bug: the Elbe (q.v.), with the Moldau and Eger: the Dniester and Adige (q.v.) have no navigable tributaries; this last, which rises in the Rhætian Alps, and flows past the famous city of Trent, enters Lombardy above Verona, and confers on that country the benefits of what commercial importance it possesses—being navigable only up to a point below Legnago. The Rhine only bounds the empire for about 14 m. above lake Constance. The Isonzo, Zermagna, Kerka, and Narenta flow into the Adriatic.

The canal system of Austria is in general not extensive. Canal construction is recent. The Vienna and Neustadt canal, in lower Austria, has a length of 40 m.; the Bacser or Franz canal, between the Danube and Theiss in Hungary, 69 m.; and the Bega canal, constructed by the Romans, between the Bega and Temes, 83 miles. Extensive lines are still capable of being opened up, affording the only possible communication with many places now inaccessible, and, at the same time, the means of rescuing tracts of arable land from inundations.

The *climate* of A. is on the whole very favorable; but from the extent and diversity of surface, it presents great varieties. In the warmest southern region between 42° to 46° lat., rice, olives, oranges, and lemons ripen in the better localities; and wine and maize are produced everywhere. In the middle, temperate region from 46° to 49°, which has the greatest extent and diversity of surface, wine and maize still thrive in perfection. In the northern region, beyond 49°, except in favored spots, neither wine nor maize succeeds; but grain, fruit, flax, and hemp thrive excellently. The mean temperature of the year is, at Triest, 58° F.; at Vienna, 51°; at Lemberg, in Galicia, 44°.

The raw products of A. are abundant and various; and in this respect it is one of the most favored countries in Europe. What one province lacks, another supplies. Its mineral wealth is not surpassed in any European country; it is only lately that Russia has exceeded it in the production of gold and silver. Mining has been a favorite pursuit in A. for centuries, and has been encouraged and promoted by the government. Bohemia, Hungary, Styria, Carinthia, Salzburg, and Tyrol take the first place in respect of mineral produce. Except platina, none of the useful metals is wanting. The mines are partly state property, and partly owned by private individuals. The value of their yearly produce is estimated at about £9,000,000. Of this sum coal yields about a half, iron a fifth, salt a tenth, and gold and silver together one fourteenth. The number of persons employed in mines and smelting-works is about 150,000, a third of whom are in Hungary. Gold is found chiefly in Hungary and Transylvania, and in smaller quantity in Salzburg and Tyrol. The same countries, along with Bohemia, yield silver. The discovery of quicksilver at Idria (q.v.) first brought this branch of mining industry into importance. This metal is now also found in Hungary, Transylvania, Styria, and Carinthia. Copper is found in many districts—tin, in Bohemia alone. Zinc is got chiefly in Cracow and Carinthia. The most productive lead-mines are in Carinthia. Iron is found in almost every province of the monarchy, though Styria, Carinthia, and Carniola are chief seats. The production, though great, is not yet equal to the consumption. Antimony is confined to Hungary; arsenic is found in Salzburg and Bohemia; cobalt in Hungary, Styria, and Bohemia; sulphur in Galicia, Bohemia, Hungary, Salzburg, etc., though not enough to supply home consumption. Graphite is found abundantly in Bohemia, Moravia, Carinthia, etc.

The useful earths and building stones are to be had in great profusion; all sorts of clay up to the finest porcelain earth (in Moravia, Bohemia, and Hungary), and likewise marble, gypsum, chalk, etc. Of precious and semi-precious stones are the Hungarian opal (which passes in commerce as oriental), Bohemian garnets (the finest in Europe), cornelians, agates, beryl, amethyst, jasper, ruby, sapphire, topaz, etc.

The following table shows the principal metals and minerals produced in A. in 1872, and their value in florins:

	Weight.	Value in florins.
Gold (Austrian pound)	2,804	1,892,287
Silver "	74,043	3,331,925
Quicksilver (Austrian hundredweight)	7,170	1,240,798
Zinc " "	45,013	477,179
Copper " "	30,886	1,342,033
Lead " "	102,339	1,305,646
Iron, raw and cast " "	8,477,115	.....
Graphite " "	648,318	.....
Mineral coal " "	93,971,990	.....

A. is peculiarly rich in salt. Rock-salt exists in immense beds on both sides of the Carpathians, chiefly at Wieliczka (q.v.) and Bochnia in Galicia, and in the co. of Marmaros in Hungary, and in Transylvania. The annual produce of rock-salt is greatly above 3,000,000 cwt. Salt is also made at state salt-works by evaporating the water of salt-springs. The chief works are those at Ebensee, Aussee, Hallstadt, Ischl, Hallein, and Hall in Tyrol. From two to three million cwt. are thus produced annually. A considerable quantity is also made from sea-water on the coasts of the Adriatic. The sale of salt is in A. a government monopoly. Of other salts, alum, sulphate of iron, and sulphate of copper are the chief. There are inexhaustible deposits of coal in the monarchy; but they have not yet been rightly explored, nor are nearly all that are known yet worked. They are spread over all the provinces; but the richest are in the mountain-systems of Moravia and Bohemia. Of recent years, however, a great deal has been done to develop this particular branch of mining. A. has abundance of mineral springs, frequented for their salubrity; 1600 are enumerated, some of them of European reputation, as the sulphurous baths of Baden in lower A., the saline waters of Karlsbad, Marienbad, and Ofen, etc.

The *vegetable productions*, as might be expected from the vast variety in the soil and position of the different provinces, are extremely various. Although three-fourths of the surface is mountainous, more than five-sixths is productive, being used either for tillage, meadows, pasture, or forest. Grain of all kinds is cultivated, most abundantly in Hungary and the districts s. of it on the Danube; in Bohemia, Moravia, Silesia, and Galicia. Agriculture is not yet far advanced; the prevailing system is still what is called the three-field system, introduced into Germany by Charlemagne, in which a crop of winter wheat is followed by one of summer grain, and that by fallow. In Hungary, the Magyar adheres to his primitive husbandry, the German and Slav are adopting rational methods. Rice is cultivated in the Banat, but not enough for the consumption. Potatoes are raised everywhere; and in elevated districts are often the sole subsistence of the inhabitants. Horticulture is carried to great perfection; and the orchards of Bohemia, A. proper, Tyrol, and many parts of Hungary, produce a profusion of fruit. Great quantities of cider are made in upper A. and Carinthia, and of plum brandy in Slavonia. In Dalmatia, oranges and lemons are produced, but not sufficient for the requirements of the country; twice as much olive-oil is imported as is raised in the monarchy.

In the production of wine, A. is second only to France. With the exception of Galicia, Silesia, and upper A., the vine is cultivated in all the provinces; but Hungary stands first, yielding not only the finest quality of wine, but four-fifths the amount of the whole produce of the empire. The average produce of the whole empire is estimated at about 400,000,000 gallons, which is mostly consumed by the inhabitants themselves.

Of plants used in manufactures and commerce, the first place is held by flax and hemp. Flax is cultivated almost universally; white hemp in Galicia, Moravia, and Hungary. Tobacco is raised in great quantities, especially in Hungary, which also is first in the cultivation of rape-seed. Bohemia raises hops of the first quality, which are partly exported; though other provinces require to import from abroad. The indigo plant has been lately successfully acclimatized in Dalmatia. Nearly a third of the productive surface is covered with wood (66,000 sq.m.), which, besides timber, yields a number of secondary products, as tar, potash, charcoal, bark, cork, etc.

As to *animals*, bears are found in the Carpathians, Alps, and Dalmatia; wolves, jackals, and lynxes in these same districts, and also in the Banat, Croatia, Slavonia, and the military frontiers. The marmot, otter, and beaver are also found in Dalmatia. Game has of late sensibly diminished. The wild goat lives in the highest, the chamois and white Alpine hare in the middle regions of the Alps and Carpathians. More productive than the chase are the fisheries of the Danube, Theiss, and numerous streams, lakes, and ponds. The chief sea-fishing is in Dalmatia. Leeches, procured chiefly in Hungary and Moravia, form an article of considerable trade. For foreign commerce the most important branch of rural industry is the rearing of silk. A. produces about a quarter of a million of silk cocoons annually. The silk trade is very extensive in the Tyrol—the yearly supply of cocoons in that country being 32,000.

The breeding of *domestic animals* has not yet advanced to what the home wants require. In some districts it is excellent, in others quite neglected. Horse-breeding is promoted by what are called "military studs." Besides a number of imperial studs,

there are a great many private establishments, especially in Hungary, for the same purpose. The supply of black-cattle is not equal to the demand; great numbers are furnished by Hungary and Galicia. The breeding of sheep, like that of horses, has been a special object of care to the government. The finer wools are furnished by Moravia, Bohemia, Silesia, lower A., and great part of Hungary and Galicia. The great mass is, however, composed of what is known as middling and inferior sorts. Goats are reared chiefly in Dalmatia, and swine in Hungary. In 1873, the number of horses in the monarchy was stated at 3,548,442; cattle, 12,704,405; sheep, 20,103,395; goats, 1,552,055; swine, 6,994,752; and bee-hives, 1,531,152. Nearly three-fourths of the population are engaged in husbandry, so that A. is decidedly an agricultural state, though its capabilities in this respect have by no means been fully developed.

The *population* is very unequally distributed. The most populous districts are those of the s.w. and of the n-w. The Alpine regions and those of the Carpathians are the sparsest; and generally the density diminishes towards the east. At the end of 1869 Austria had, besides Vienna, 3 cities of above 100,000 inhabitants, and 32 others with more than 20,000. Vienna, with 834,284 inhabitants then, was found by special census in 1875 to have, with suburbs, 1,020,770. The population of Austria embraces a greater number of races, distinct in origin and language, than that of any other European country except Russia. The proportions in this respect are here given from the official statements of 1870. The Slavs are the most numerous race, amounting to 16,219,000, nearly 50 per cent of the whole population in 1870. They form the bulk of the population of Bohemia, Moravia, Carniola, Dalmatia, Croatia, Slavonia, the military frontiers, the Woiwodina, the n. of Hungary, and Galicia. They are, however, split up into a number of peoples or tribes, differing greatly in language, religion, culture, and manners; so that their seeming preponderance in the empire is thus lost. The chief branches of the Slavic stem are the northern Czechs (the most numerous of all), Ruthenes, and Poles, and the southern Slowens, Croats, Serbs, and Bulgarians. The Germans numbered 9,040.000, or about 25 per cent. They are dispersed over the empire, but predominate most in the duchy of A., Salzburg, Tyrol, Styria, Carinthia, w. of Hungary, etc. The Romanic peoples (speaking languages derived from that of ancient Rome) amounted to 3,456,000, or fully 9½ per cent, and are divided into western and eastern. To the first, the Germans give the general name of Welsch. They consist of Italians, inhabiting the s. of Tyrol, Istria, and Dalmatia; the Ladins (Latins), occupying some valleys in Tyrol; and the Friauls about Görtz, n. of Triest. The eastern Romans are the Valaks or Wallachians, styled by themselves Rumuni, who are found in Transylvania, Hungary, the Woiwodina, Bukowina, and military frontiers. The Magyars, or Hungarians proper, numbered 5,431,000 (over 15 per cent): they are located chiefly in Hungary and Transylvania; also in the Woiwodina, and a few in Croatia and Slavonia. The small remaining portion are composed chiefly of Jews, Armenians, and Bohemians or gypsies; and collectively they number 1,354,000, which is pretty nearly 3¾ per cent.

As to *religion*, the great bulk of the nation is Roman Catholic. At the beginning of 1870 there were 23,954,233 Roman Catholics; of Greeks in union with the church of Rome there were 3,941,796; not in union, 3,050,830. The Protestants of all denominations numbered 3,570,989; and the Jewish persuasion claimed 1,375,861. The church of Rome has 11 archbishoprics and 40 bishoprics, and an army of secular priests. At the accession of Joseph II., there were 2024 convents; but at the end of the French war (1816) they had been reduced to 800. There are at present nearly 300 abbeys and above 500 convents in the empire.

Education, since 1849, is under the care of a minister of public worship and instruction. As compared with other German states, the education of A. presents some peculiarities. There is a greater prevalence of establishments where the pupils both live and receive instruction; also of schools for special callings. Instruction, again, whether high or low, is mostly gratuitous, or of trifling cost, being provided from general or local public funds. The government has recently made liberal allowance for elementary education. Another peculiarity is the sway of the clergy, both in schools and universities. The primary schools are, to a very large extent, in their hands. The number of elementary schools has increased greatly in recent times. The law enforces compulsory attendance at the "Volks-schulen," or national schools, of all children between the ages of 6 and 12; and parents are liable to be punished for neglecting to send them. Hungary is still backward in elementary education. There are eight technical schools in the empire. The eight universities are at Vienna, Prague, Grätz, Innsbrück, Pesth, Cracow, Lemberg, and Czernowitz (the latter founded in 1875). The first four of these, ranking as German universities, had in 1872—

Professors and teachers—	Vienna.	Prague.	Grätz.	Innsbrück.
Ordinary professors	68	48	40	41
Extraordinary professors	38	22	10	7
Assistant professors	86	21	17	9
Teachers of languages, etc.	8	6	3	1
Total	200	97	70	58

	Vienna.	Prague.	Grätz,	Innsbrück.
Students—				
Faculty of theology.....	198	207	103	197
" jurisprudence.....	1304	640	312	104
" philosophy.....	697	265	143	148
" medicine.....	1383	500	292	79
Total matriculated students.....	3564	1612	850	528
Non-matriculated students.....	317	97	76	84
Total.....	3881	1709	926	612

In 1875, Vienna had 3920 students; Prague, 1751; Pesth, 122 teachers and 1912 students; Cracow and Lemberg, the universities of Galicia, and the other Slavonian provinces, number 70 professors and 1800 students. There are also a large number of establishments where the pupils are received young, and educated and trained for special professions, for the army and navy, for the counting-house, for the mine and the farm, as accoucheurs, etc. There are, besides, a large number of institutes for the promotion of science and art. The fruits of this extensive educational system are not what might be expected, in consequence of the priestly and monarchical restrictions which hedge it round. The chief libraries are the imperial and university libraries of Vienna. There are in the whole monarchy 755 newspapers and other periodical prints, of which fully the half are in German. Such of them as are political are fettered by conditions which render them quite worthless as organs of public opinion.

The *manufacturing industry* of A. is not yet adequately developed, but of late years has made great strides. The annual value of its manufactures—not including small trades—is estimated at 1200 to 1500 million florins, while that of its husbandry may reach 2500 millions. Bohemia takes the lead in this industry; then follow Austria proper, Moravia and Silesia, and Hungary. Vienna is the chief seat of manufacture for articles of luxury; Moravia, Silesia, and Bohemia for linen, woolen, and glass wares; Styria and Carinthia, for iron and steel wares. The chief manufactured articles of export are those of silk and wool; the only others of consequence are linen twist, glass wares, and cotton goods. The yearly value of manufactured iron is about 54 million florins. The glass wares of Bohemia are of special excellence. The hemp and flax industry is one of the oldest and still most important. No branch of industry has risen more rapidly than that of cotton. The manufacture of silk is very extensive. The manufacture of tobacco is a state monopoly, and brings a revenue of nearly 60 million florins; the salt monopoly, 18 millions.

In respect of *commerce*, A. is most unfavorably situated. High mountains oppose great obstacles on all hands to communication, and separate the producing districts from the only sea that touches the empire; while the chief navigable rivers have their mouths in other countries. Much has been done to remedy these obstacles. Since 1809, a length of 20,000 m. of highways has been made. The great Alpine roads over the Stelvio pass and the Semmering (q.v.) are among the most remarkable constructions of our times. More remarkable still are the railways over the Brenner pass and the Semmering. The first railway in A. was a horse railway, constructed in 1825–32. The state in 1841, resolved to undertake the construction of railways, and since then a great extent has been laid down. A tolerably complete network of railway now brings all places of importance into easy communication with each other. The total length of railways in the empire open to traffic in Oct., 1876, was 10,852 English miles. The length of lines under construction was about 2000.

The length of telegraph lines in the empire in 1876 was about 28,000 English miles. The number of messages carried in 1875 was 5,458,920. In 1876 there were in Austria proper 4366 post-offices, and in Hungary 1930. The number of letters and packets passing through the post in A. in 1875 was 244,331, and in Hungary in 1874, 68,673.

River-communication received a great impulse from the introduction of steam. By means of the Danube steam company, formed in 1850, and a second company (1852) confined to tug-navigation, passengers and goods are now conveyed on the Danube between Ulm and Galatz, and on to Constantinople. The Austrian Danube steam company has a fleet of steamers plying on the Danube, the annual receipts from conveyance of goods being more than 7 million florins. This traffic would be vastly greater were the lower Danube freed from the influence of Russia.

A great number of the political impediments to commerce have been removed or diminished. The customs-boundary that separated Hungary and the adjoining provinces from the rest of the empire, was done away in 1851, so that the whole is included in one customs district, with the exception of Dalmatia, which still forms a small district by itself; the free ports of Triest, Fiume, one or two other minor free ports and districts. By the new tariff, which came into partial operation in 1852, A. has passed from a prohibitive to a protective system. No article is admitted duty-free; but absolute prohibition is confined to articles of state monopoly (salt, powder, and tobacco). Goods for mere transit or trans-shipment pay no duty. But the foreign commerce of A. is nothing compared with that between the different provinces. The great center of this internal commerce is Vienna: other important markets are Linz, Prague, Lemberg, Brody, Pesth,

Grätz. The imports and exports of merchandise and bullion for the whole of the empire except the province of Dalmatia, which, as has been mentioned, is not within the imperial line of customs, were tabulated as follows for 1875 and 1876:

	Merchandise. Florins.	Bullion and Coin. Florins.
IMPORTS—1875	552,500,000	15,800,000
1876	516,900,000	33,800,000
EXPORTS—1875	504,500,000	18,400,000
1876	509,600,000	30,500,000

For Dalmatia, the imports were in 1875, 13,400,000 florins, and in 1876, 12,900,000; the exports in 1875 were 10,400,000, and in 1876, 7,800,000. The principal articles of import into the Austrian empire are raw cotton and other materials for spinning, the value of this item reaching in 1876 the sum of 95,600,000 florins. Next in importance come manufactured cloths, valued at 61,600,000 in 1876; tobacco, and miscellaneous colonial produce. Some of the imports are partially re-exported; of native produce exported the most important are articles in metal, valued at 67,200,000 florins; cereals, 54,600,000; wood, 30,600,000; and pottery, 29,200,000.

The chief harbors of A. are those of Istria—Triest, Rovigno, Pirano, Citta Nuova, etc.; of Croatia—Fiume, Buccari, Novi; of Dalmatia—Zara, Spalatro, Ragusa, Cattaro, Curzola, etc.

As to *form of government*, A. is a monarchy hereditary in the house of Hapsburg-Lothringen. In the case of the reigning family dying out, the states of Bohemia and of Hungary have the right of choosing a new king; but for the other crown-lands, the last sovereign appoints his own successor. The reigning house must profess the Roman Catholic faith.

Till 1848, Hungary and Transylvania had a constitution limiting the monarchy, which was absolute for the rest of the empire; though the several provinces had each its consultative council composed of clergy, nobles, and burghers. After the revolution of 1848, and the subsequent reaction, all marks of independence of the separate provinces disappeared. The imperial constitution granted (*octroyirte*) March 4, 1849, as well as the provincial constitutions that followed, were abolished, and government was organized in the most absolute form by the imperial "patent" or charter of Dec. 31, 1851. The patent guaranteed to every religious body recognized by law protection in the observance of public ordinances, in the management of its own affairs, and in the possession of buildings and funds for the purpose of worship and instruction. The relation of the Roman Catholic church to the state was put upon a new footing. It was no longer under the oversight of the secular authority, the *placetum regium* and church-patronage were abolished, ecclesiastical jurisdiction for discipline, and the independent administration of church property, were conceded, and the intercourse of bishops and of all Catholics with Rome left free. The clergy had no longer to submit to examination or tests on the part of the state; they were nominated by the state, but only with the concurrence of the bishops, and without that concurrence they could not be deprived of their office. Along with all this, they obtained an overwhelming influence over education, even in the universities; and by the concordat signed in the early part of 1856, this influence was very greatly increased. The patent further guaranteed the equality in the eye of the law of all citizens irrespective of nation, rank, or religion, and the liberation of the land from all serfdom. Subsequent patents (e.g. for Hungary, Croatia, etc., in 1853) regulated the claims between existing proprietors and their vassals, and determined the indemnities due to the former for their seignorial rights.

But since the year 1867 A. has been reconstructed as a twofold empire, consisting of a German or "Cisleithan" monarchy, and a Magyar or "Transleithan" kingdom. The former is generally known as Austria proper, and the latter as Hungary. Each of the two countries has its own laws, parliament, ministers, and government; and the formal tie between them is a body known as the delegations. These form a parliament of 120 members: the one-half is chosen by the legislature of German Austria, which is represented by it, and the other half represents Hungary. The person of the sovereign is another knot in the tie between the two members of the empire. The Magyars claim, under certain conditions, the right of freely electing their monarch. The delegations have jurisdiction over all matters affecting the common interests of the two countries, especially foreign affairs, war, and finance; the ministries of which three departments are responsible for the discharge of their official functions to the delegations, a committee of whom sits permanently. The acts of the delegations require to be confirmed by the representative assemblies of their respective countries; and in this manner it is attempted to leave the self-government of both Austria proper and Hungary free.

The administration of Austria proper is divided at present among seven ministries—public education and ecclesiastical affairs, agricultural, finance, interior, national defense, commerce, and justice. Formerly the ministry was merely the collective organ of the emperor, and was responsible to him alone. But a bill passed by the reichsrath in 1867,

and sanctioned by the emperor, renders it responsible to that parliament of the western empire.

The reichsrath consists of an upper and a lower house. The upper house is constituted by princes, nobles, archbishops, bishops, and life members nominated by the emperor. The lower house numbers 353 members, elected by the 14 provincial diets of the empire in the following proportions: Bohemia, 92; Dalmatia, 9; Galicia, 63; Higher Austria, 17; Lower Austria, 37; Salzburg, 5; Styria, 23; Carinthia, 10; Carniola, 9; Bukowina, 9; Moravia, 36; Silesia, 10; Tyrol, 17; Vorarlberg, 3; Istria and Triest, 4. The members of the reichsrath are elected in the provincial diets, and no one who is not a member of one of these is eligible to the wider sphere of legislation. The emperor nominates the presidents and vice-presidents of both houses. The rights claimed by the reichsrath are: 1. *Consent* to all military laws; 2. *Co-operation* in legislature affecting trade and commerce, customs, banking, posting, telegraphs, and railways; 3. Examination of the estimates, and general control of the public debt. To give validity to bills passed by the reichsrath, the consent of both chambers is required, as well as the sanction of the emperor.

The executive of Hungary is carried on in the name of "the king" by a responsible ministry.

Finance.—The protracted wars of the first 15 years of the 19th c. had so exhausted the resources of A., and shattered her credit, that paper money, after being already twice reduced, had again sunk to 25 per cent of its nominal value; and even 5 per cent loans could only be obtained at a sacrifice of sometimes more than 50 per cent. During the 30 years that followed the war, much was done to restore the state credit, and 4 per cent state paper was bought at par. The revolution of 1848 brought new difficulties, from which the finances had not recovered, when the Crimean war increased the expenditure; the war with Prussia and Italy in 1866 increased the public debt by about 300,000,000 florins, but on the other hand freed A. from the Lombardo-Venetian debt of about 35,000,000 florins.

The budget estimates for the common affairs of the empire, for 1872, were—revenue, 17,208,883; expenditure, 110,647,498 florins; leaving a deficit of 93,438,615. The estimated revenue for 1877 was 117,091,389 florins, which was balanced by the estimated revenue. On the 1st July, 1876, the national debt of the Austrian empire was 3,065,269,072 florins, or £306,526,906 sterling. The estimated revenue for Austria proper (the countries represented in the reichsrath) in 1877 was 376,637,817 florins; the expenditure, 405,569,474 florins.

*History.**—The nucleus around which this great empire has grown was that part of the archduchy of A. that lies below the Ens. In the age of Charlemagne, about 800, the defense of the south-eastern frontier of Germany against Asiatic hordes gave rise here to a margraviate, called the eastern mark or boundary of the empire, or Ostreich (Austria), the eastern government; which, being united in 1156 to the country above the Ens, was raised to a duchy. After coming, in 1282, into the possession of the house of Hapsburg (q.v.), it rapidly rose to a powerful state. The princes of that house extended their dominion by marriage, purchase, and otherwise, over a number of other states, and from 1438 held almost uninterruptedly the throne of the German empire. By the acquisition (1526 and 1527) of the crowns of Bohemia and Hungary, the house of A. rose to the rank of a European monarchy. In 1804, Francis declared himself hereditary emperor of A., and, two years afterwards, laid down the title of emperor of Germany and king of the Romans.

In the earliest times, what is now the duchy of A. was inhabited by the Taurisci, a Celtic people; but their name subsequently disappeared before that of the Norici. After the conquest of the Norici by the Romans (14 B.C.), the country to the n. of the Danube belonged to the kingdom of the Marcomanni (q.v.); on the s. of the river lay the Roman provinces of Noricum and Pannonia, in which last was the municipal city of Vindobona (Vienna). Tyrol formed part of Rhætia. All these boundaries were swept away by the irruption of the northern peoples; and the regions in question were occupied in succession, during the 5th and 6th centuries, by Boii, Vandals, Goths, Huns, Lombards, and Avari. After the Lombards had settled in Italy, the Ens came, about 568, to be the boundary between a tribe of German origin and the Avari, a people who had penetrated thither from the east. The Avari having, in 788, crossed the Ens, and fallen upon Bavaria, then part of the Frankish empire, Charlemagne drove them back (796) as far as the Raab, and united the district from the Ens to that river with Germany, under the name of the East Mark, Marchia Orientalis, or Austria. He sent colonists, mostly Bavarians, into the new province, and appointed over it a margrave. It came into the possession of the Hungarians in 900, but was reconquered by Otto I. in 955, and reunited with Germany.

As margrave of the reconquered province, the emperor, in 983, appointed Leopold of Babenberg (q.v.), whose dynasty ruled A. for 260 years. Under Henry Jasomirgott (1141–1177), the mark above the Ens was annexed to the lower mark, the united province raised to a duchy, and important privileges conferred on the newly named duke and

* As the history of A. and its rulers involves, for many centuries, the main strand of the thread of European history, it is given at somewhat more than the usual length.

his heirs. This Henry Jasomirgott took part in the second crusade; he also removed the ducal residence from Leopoldsberg to Vienna, now first called a city, and began the building of the cathedral of St. Stephen. Under his successors, numerous additions (Styria, Carniola) were made to the possessions of the house. Leopold VI. undertook numerous expeditions against the Hungarians and the infidels, and is reckoned the best of the Babenberg princes. The line became extinct with his successor, Frederick, who fell in battle with the Magyars (1246).

Then followed an interregnum from 1246 to 1282. The emperor Frederic II. at first treated the duchy as a lapsed fief of the empire; shortly, claims were set up by Count Hermann of Bavaria, who was married to a niece of the deceased margrave, Frederic; and when Hermann died, and the empire was distracted by the contests between rival emperors, the "states" of A. and Styria chose Ottokar, son of the Bohemian king, as duke, who made good his nomination about 1260. Ottokar, refusing to acknowledge Rudolf of Hapsburg as emperor, was defeated, and lost his life and possessions, in the battle of Marchfeld (1278); and the emperor shortly afterwards (1282) conferred the duchies of A., Styria, and Carinthia on his son Albrecht.

The accession of the Hapsburg dynasty with Albrecht I. (q.v.) was the foundation of A.'s subsequent greatness. The despotic Albrecht contended successfully with Hungarians and Bavarians, but while attempting to subdue the Swiss, he was murdered near Rheinfelden (1308) by his nephew, John of Swabia, whom he had deprived of his hereditary possessions. Of his 5 sons, Frederic was chosen (1314) by a party to the imperial throne, but was defeated (1322) by his rival, Ludwig of Bavaria. Duke Leopold was defeated at Morgarten (1315) in his attempt to reduce the Swiss cantons that had thrown off their allegiance to Albrecht I. At last, by the death of all his brothers, Albrecht II. reunited the Austrian possessions, increased by various additions. After his death (1358), two sons, Rudolf and Albrecht III., successively followed in the duchy of Austria. Another son, Leopold, held the other lands, but lost his life at Sempach, in seeking to regain the Hapsburg possessions in Switzerland. The posterity of Albert and Leopold formed the two lines of A. and Styria. During Albrecht III.'s reign, Tyrol and other districts were ceded to Austria. After his death (1395), the dukedom was held by his son, Albrecht IV. Albrecht V., who succeeded his father in 1404, by marrying the daughter of the emperor Sigismund, succeeded ((1438) to the thrones of Hungary and Bohemia, and was at the same time raised to the dignity of German emperor, as Albrecht II. With his death, in 1439, Bohemia and Hungary were for a time lost to the house of A., as were also, after a bloody struggle, the last of the family possessions in Switzerland. But the imperial dignity was henceforth uninterruptedly held by them. With Ladislaw, Albrecht's son, the Austrian line of the house closed (1457), and their possessions went to the Styrian line. Of this line was the emperor Frederic III., who raised the dignity of his house by making A. an archduchy. After the death of Ladislaw and of his own brother, Albrecht, Frederic came into the undivided possession of the archduchy (1464).

His son, Maximilian I., by marrying Maria, daughter of Charles the Bold, acquired (1477) the Netherlands. Becoming emperor on the death of his father (1493), he ceded the government of the Netherlands to his son Philip. Under Maximilian, Tyrol fell again to the chief branch of the house of A., several districts were acquired from Bavaria, and fresh claims were established on Hungary and Bohemia. The court of Vienna began to be the seat of German art and science. The marriage of the emperor's son Philip with Johanna of Spain set the house of Hapsburg on the throne of Spain and the Indies. Philip died in 1506, and on the death of Maximilian I., in 1519, Philip's son, Charles I. of Spain, was elected German emperor as Charles V. (q.v.). Charles resigned by treaty all the German possessions, except the Netherlands, to his brother, Ferdinand I. (q.v.).

Ferdinand I. had married the sister of Lewis II. of Hungary; and on the death of the latter in the battle of Mohacz (1526), he claimed the kingdoms of Hungary and Bohemia, along with Moravia, Silesia, and Lausatia. His claim was contested by John Zapolya, who secured the aid of sultan Soliman II.; and Ferdinand, after contests extending over 20 years, had finally to pay an annual tribute of 30,000 ducats to Soliman for possession of Lower Hungary. Ferdinand was also fain to surrender Würtemberg to Duke Ulrich (1534), on condition of its reverting to A. on the death of the male line. Nevertheless, the possessions of the house of A. (in the German line) were at this time already of the extent of 110,000 sq. miles. On the abdication of Charles V. (1556), Ferdinand succeeded to the imperial dignity; he died 1564, with the reputation of a good ruler, though he was strongly conservative of everything established, and introduced the Jesuits.

In the partition of the inheritance that took place among his three sons, the eldest, Maximilian II., received the imperial crown along with A., Hungary, and Bohemia; the second, Ferdinand, Tyrol and Upper A.; the third, Karl, Styria, Carinthia, etc. Maximilian was more fortunate in Hungary than his father. The death of Soliman before Szigeth (1566) led to a truce; he got his eldest son, Rudolf, crowned king of Hungary in 1572, and shortly after, of Bohemia, and also chosen king of Rome. But his attempt to bring the crown of Poland into his house failed. Maximilian II. was fond of peace, tolerant in religion, and a just ruler. He died 1576; and of his 5 sons, the eldest,

Rudolf II., became emperor. Under him, the possessions of the archduke Ferdinand of Tyrol, who had married Philippine Welser (q.v.), the beautiful daughter of an Augsburg burgher, reverted to the other two lines, Ferdinand's children not being considered noble. Rudolf II. adhered to the old feudal usages, and was a negligent sovereign, leaving everything to his ministers and the Jesuits. His war with the porte and Transylvania brought him little credit; and the Protestants of Bohemia, oppressed by the Jesuits, extorted from him a charter of religious liberty. At last he was obliged, in 1608, to cede Hungary, and, in 1611, Bohemia and A. to his brother Matthias (q.v.). Matthias, who became emperor in 1612, concluded a 20 years' peace with the Turks, and ceded (1617 and 1618) Bohemia and Hungary to his cousin Ferdinand, son of the archduke Karl of Styria, third son of Maximilian II. Matthias lived to see the outbreak of the thirty years' war (q.v.), and died March 20, 1619.

Bohemia refused to acknowledge his successor, Ferdinand II. (q.v.), to whom all the Austrian possessions had again reverted, and chose the elector palatine, Frederic V., the head of the Protestant union, as king. The states of A. and the Hungarians were also refractory. But the battle of Prague (1620) subjected Bohemia to Ferdinand; who formally set about rooting out Protestantism in that country and in Moravia, annulled their right of electing their king, and the patent of religious freedom granted them by Rudolf II., and set up a Catholic reformation tribunal which drove thousands into exile. The emperor also succeeded in extorting acknowledgment of his sovereignty from the states of A., among which Protestantism predominated; after which Protestantism was rigorously prohibited. Hungary also was at last compelled to yield, which had revolted under the prince of Transylvania. But this religious war and persecution cost the house of A. the life-blood of its possessions. Of 732 cities in Bohemia, only 130 were left; of 30,700 villages, only 6000; of 3,000,000 inhabitants, only 780,000. Under Ferdinand's successor, the emperor Ferdinand III. (1637–1657), A. continued to be a theater of war; and at the peace of Westphalia (1648), had to cede Alsace to France. Ferdinand III.'s son and successor, Leopold I., provoked the Hungarians to rebellion by his severity. Tekeli (q.v.) received aid from the porte, and Kara Mustapha besieged Vienna (1683); which was rescued only by an army of Poles and Germans under John Sobieski hastening to its assistance. The emperor's generals now reduced the whole of Hungary, which was declared a hereditary kingdom in the male line (1687). Prince Eugene compelled the porte (1699) to restore the country between the Danube and Theiss, and, in 1718, to cede other important provinces to Hungary. The struggle between Leopold and Louis XIV. of France for the heirship to the king of Spain, led to the war of the Spanish succession (q.v.), during which Leopold died, May 5, 1705. He was of sluggish phlegmatic character, and wholly under the influence of the Jesuits.

His eldest son and successor, the enlightened Joseph I. (q.v.), continued the war. He d. childless, April 17, 1711, and was succeeded by his brother, Karl VI. The peace of Utrecht concluded under his reign (1713) secured to A. the Netherlands, Milan, Mantua, Naples, and Sicily. The monarchy now embraced 190,000 sq.m., with 29,000,000 inhabitants, and had a revenue of 14,000,000 florins, with an army of 130,000 men. Its strength, however, was soon much exhausted by fresh wars with France and Spain. At the peace of Vienna (1737), Karl VI. had to give up Naples and Sicily to Don Carlos of Spain, and part of Milan to the king of Sardinia, receiving only Parma and Piacenza instead. He also lost at the peace of Belgrade (1739) nearly all the fruits of Eugene's conquests, giving back to the porte Belgrade, Servia, and the parts of Wallachia and Bosnia that had belonged to Austria. The emperor conceded all these points with the view of securing adhesion to the pragmatic sanction (q.v.), which conferred the succession on his daughter, Maria Theresa.

With his death (Oct. 20, 1740) the male line of the Hapsburgs was extinct, and Maria Theresa, who was married to Franz Stephan, duke of Lorraine, assumed the government. But counter-claims were raised on all sides, and a violent war arose, in which England alone sided with Maria. Frederic II. of Prussia conquered Silesia. The elector of Bavaria took the title of archduke of A., was crowned king of Bohemia at Linz and Prague, and elected emperor as Karl VII. (1742). The Hungarians alone stood by their heroic queen; who, at the peace of Breslau (1742) was forced to yield Silesia to Prussia. Frederic renewed the war by coming to the assistance of the emperor; but Karl dying (1745), Maria Theresa's husband was elected German emperor as Franz I. A second treaty of peace (1745) secured Silesia anew to Prussia; and at the peace of Aix-la-Chapelle (1748), A. had to cede Parma, Piacenza, and Guastalla to Don Philip of Spain, and several districts of Milan to Sardinia. These sacrifices secured the existence of the Austrian monarchy; but Maria Theresa wished to recover Silesia, and with this view, entered into alliance with France, Russia, Saxony, and Sweden; but after a bloody seven years' war (q.v.), Prussia retained Silesia, and A. had spent her blood and treasure in vain. At this time, paper-money first appeared in A., under the name of state-bonds. At Franz's death (1765), his son, Joseph II., became German emperor, and joint-regent with his mother of the hereditary states. Collateral branches of the house of A. were planted by the younger sons of Maria Theresa, the archduke Leopold of Tuscany, and the archduke Ferdinand, who married the heiress of Este (see MODENA). In the first partition of Poland (1772), A. acquired Galicia and Lodomeria, and the Bukowina was ceded by the porte in 1777. At the death of the empress in 1780, the monarchy had an

extent of 234,000 sq.m., with a pop. of 24,000,000, and a debt of 160,000,000 florins. The administration of Maria Theresa was distinguished by unwonted unity and vigor both in home and foreign relations.

Her successor, Joseph II., was an active reformer in the spirit of the enlightened despotism of the times, though often rash and violent in his mode of proceeding. He introduced economy into every department, remodeled the censorship of the press, granted liberties and rights to Protestants, abolished 900 convents, and revised the school-system. His protective system of duties, though exhibiting his narrowness as a statesman, gave a start to native manufactures. But his reforming zeal and passion for uniformity excited opposition; the Netherlands rose in insurrection, and other disturbances broke out, which hastened his end (1790). He was succeeded in the government by his brother, the grand duke of Tuscany—as German emperor, Leopold II.—who succeeded in pacifying the Netherlands and Hungary. Peace was concluded with Prussia and Turkey (1790). The fate of his sister, Marie Antoinette, and her husband, Louis XVI., led Leopold to an alliance with Prussia; but he d. (Mar. 1, 1792) before the war with France broke out. The war was declared by France on his son Franz II., the same year (see FRANCE). By the treaty of Campo Formio (q.v.), 1797, A. lost Lombardy and the Netherlands, receiving in lieu the Venetian territory; two years later, at the second partition of Poland, it was augmented by West Galicia. Franz, in alliance with Russia, renewed the war with France in 1799, which was ended by the peace of Luneville. It is needless to follow all the alterations of boundary that the Austrian dominions underwent during these wars. The most serious was at the peace of Vienna (1809), which cost A. 42,000 sq.m. of territory, and 11,000,000 florins of her revenue. It was in 1804, when Napoleon had been proclaimed emperor of France, that Franz declared himself hereditary emperor of Austria, uniting all his dominions in one empire. On the establishment of the confederation of the Rhine, he laid down the dignity of German emperor, which his family had held for nearly 500 years, and now took the title of Franz I., emperor of Austria.

The humiliating peace of Vienna was followed (1809) by the marriage of Napoleon with the archduchess Maria Louisa; and in Mar., 1812, Napoleon and Franz entered into alliance against Russia. But when the Russian campaign of 1812 had broken the power of the French emperor, his father-in-law declared war on him (Aug., 1813), and joined the alliance of England, Russia, Prussia, and Sweden. The active part which the emperor Franz now took in the downfall of Napoleon, his consenting to the banishment of his son-in-law to Elba, and the firmness with which he signed the declaration of outlawry against him on his return to France, and contributed to his final overthrow, thus deciding the fortunes of his own daughter and her son—all furnished grounds of claim to that full indemnity for her losses which A. obtained at the close of the war. In the remodeling of the map of Europe that took place at the congress of Vienna (1815), 32,000 sq.m. were added to the 253,000 possessed by A. after the last partition of Poland, besides the advantages she gained in point of compactness, and facilities for trade, especially by the acquisition of Venice and Dalmatia. Ferdinand, the emperor's uncle, was also restored to the grand duchy of Tuscany, of which he had been dispossessed by Napoleon.

After that time, A. exerted a powerful influence in European politics generally, and more especially in the German confederation; and that influence was uniformly hostile to constitutionalism (see METTERNICH). When the Polish revolution broke out, a strict neutrality was assumed; but a Polish corps that was driven into the Austrian territories was disarmed, and sent into Hungary, while a Russian division that had taken refuge on Austrian soil was let go, and equipped with the Polish weapons.

The death of Franz I. (Mar. 2, 1832) made little alteration in the policy of A.; Ferdinand I. trod in his father's footsteps. The political alliance with Russia and Prussia was drawn closer by a personal conference of the emperor with Nicolas I. and Frederic William III. at Teplitz, Oct., 1833. The wonted calm was interrupted in 1840 by the war against Ibrahim Pacha in Syria, in which A. took part in union with England. An attempt at insurrection in Italy in 1844 was a complete failure.

But under this long-continued peace and superficial calm, the internal condition of the empire was coming to a crisis. The stifling bureaucratic system of government and police supervision, had produced only irritation and discontent, and was powerless to compress the fermentation. The opposition in the several nationalities became stronger and stronger, and the tactics of playing these nationalities off against one another, no longer succeeded. The Polish insurrection, which led to the incorporation of Cracow with the monarchy (Nov., 1846), had turned into a frightful rising of the peasantry in Galicia against the nobles. This enabled the government to overpower the political rising; but the success only increased the danger of the crisis, by encouraging it to proceed in the old reckless way. In the meantime the opposition to Austrian rule in Italy, Hungary, and Bohemia, was becoming uncontrollable, and even the states of lower A. insisted on some control in the management of the state. The revolutionary movement was already in full swing in Italy, when the fall of Louis Philippe (Feb. 24, 1848) shook Europe to its foundation. A host of petitions and addresses was followed, Mar. 13, by a popular movement in Vienna, to which the government and military, after a feeble resistance succumbed. Metternich resigned, the arming of the citizens and freedom of the press were granted, and the emperor promised to convoke a consul-

tative assembly from all parts of the empire. At the same time, the opposition in Hungary had carried their demand for an independent ministry responsible to the national diet, and the emperor was not in a position to withstand it. The 22d of Mar. saw the insurrection break out at Milan, and Radetzky, the military commander, forced to retire on Verona. Venice rose at the same time, and drove out the Austrians.

While the revolution was thus victorious in the provinces, the central authority was in a state of dissolution. The authority passed into the hands of the national guards and the students' legion (the *Aula*). A rising of the people (May 15), in support of the central committee, formed from the national guards, which the government had attempted to dissolve, compelled its continuance, and also a revision of the electoral law, so as to convert the new diet into a constituent assembly. These proceedings led to the flight of the court to Innsbrück (May 17). An unsuccessful attempt of the government to break the power of the "Aula," resulted in the appointment of a committee of safety, to whose influence the government had to submit. A Slavic insurrection broke out in Prague after Easter, which was repressed with bloody severity by Prince Windischgrätz. While the emperor was thus lingering at Innsbrück, leaving Vienna in the power of the populace, and the Hungarians were pursuing an independent course, it was in Italy that the power of A. began to recover itself.

Radetzky had at first been reduced to the maintaining of a defensive position at Verona, against Charles Albert of Sardinia, who had declared war on A. at the outbreak of the revolution, and the forces that came to his aid from Tuscany, Rome, and Naples; and the foreign policy of A. was in such a state of discouragement, that negotiations were entered into under the mediation of Great Britain, offering the Lombards independence on moderate conditions. But in June, Radetzky took up the offensive, reduced in succession Vicenza, Padua, and other cities, and then turning against the chief Sardinian force, defeated it at Custozza (25th July), and drove it from the field. The fruits of the victory were the dissolution of Charles Albert's army, and a truce which again delivered Lombardy to Austria.

In the mean time, the government at Vienna was more powerless than ever. The emperor remained at Innsbruck, and the constituent diet was opened, July 22, by the archduke John, as his representative. But a new crisis was ripening in Hungary. The Croats, under their ban, Jellachich (q.v.), opposed the predominance of the Magyars, and refused obedience to the Hungarian government, which, under the Batthyanyi-Kossuth ministry, was pursuing a policy almost independent of Austria. Jellachich's resistance was officially condemned by the emperor, and he was threatened with deposition; but, as subsequently appeared, his conduct was secretly approved by the court. The archduke Palatine, Stephen, now left Hungary, after a last attempt at conciliation; and the emperor, who had returned to Vienna after repeated invitations, named count Lamberg commissioner, with the supreme command in Hungary. Lamberg, however, was murdered on the bridge of Pesth (Sept. 28). The Hungarian parliament was now dissolved, and the command given to Jellachich. But the parliament continued its sittings, and appointed Kossuth president of the committee of defense. When the imperial troops now began to march against Hungary, a frightful insurrection broke out in Vienna (Oct. 6), which was attributed to Hungarian instigation. The arsenal was stormed, and the war-minister, Latour, murdered; the court fled to Olmütz, a committee of safety was appointed, the armed populace organized, and the Polish gen. Bem put at the head of military affairs; while the diet wavered between royalty and revolution. In the mean time, the military forces had withdrawn, and joined Jellachich, in order to prevent the Hungarians coming to the aid of the Viennese. Windischgrätz now approached with an army, and declared Vienna in a state of siege. The attack began on the 23d of Oct., and after a resistance of eight days, Vienna surrendered.

Severe measures were then taken; and a number of leaders, among others, Robert Blum (q.v.), were condemned and shot. The diet now met at Kremsir, and a new ministry was formed, into which prince Schwartzenberg, count Stadion, Bach, Bruck, and others entered. But the vigorous policy thought to be necessary for the restoration, and advocated by the archduchess Sophia, was not responded to by the easy nature of Ferdinand I. Accordingly, the emperor abdicated, Dec. 2, as did also the archduke Franz Karl, and the latter's son, Franz Joseph (q.v.), was declared emperor.

In winter, Windischgrätz entered Hungary, and began the Hungarian war. After the encounters at Raab and Babolna, Ofen was besieged (Jan., 1849), and the Hungarians retired beyond the Theiss, and had time to organize themselves under such able leaders as Görgei and Klapka, and to prepare for the struggle of the following summer.

In the mean time, important events took place elsewhere. In Mar. (21–23), Radetzky made his rapid and decisive campaign, which, by the victory of Novara, led to the abdication of Charles Albert, and an indemnification for war expenses from Sardinia of 15 million lire. With the surrender of Venice, which took place in Aug., the subjugation of Italy was complete.

At Kremsir, the diet proving intractable, was dissolved, Mar. 4, 1849; and a constitution was granted (*octroyirt*), with two elective chambers, responsible ministers, and other constitutional provisions. In the national assembly at Frankfurt, A. opposed the project of a confederated state under the leadership of Prussia, and managed to thwart the conferring of the empire of Germany on the Prussian king (Mar., 1849).

In Hungary, the Magyars, though the Germans and Slaves within the country itself were hostile to them, began the campaign with decided success. Bem conquered Transylvania in spite of Russian aid; and the rest of the Hungarian army advancing westward in spring, were successful against the imperial forces at Szolnok and Waitzen. Windischgrätz was replaced in the command by Welden, but the imperial cause was not improved. Kossuth's hopes rising, he proclaimed the deposition of the house of Hapsburg, and virtually made Hungary a republic. By May, Pesth and Ofen were again in the hands of the Magyars; and although gen. Welden was recalled, and the command given to Haynau, there was little prospect of success against the Magyars, if a treaty with the czar had not brought the aid of a Russian army under Paskewitsch. The Austrians still suffered several reverses, and the Hungarians performed splendid feats of arms, such as Görgei's victory at Waitzen, and Klapka's sally from Komorn; but from June, the war on the whole began to be more favorable to A., whose forces were well managed by Haynau and Jellachich; and the intervention of the Russians brought an irresistible weight of numbers against the Magyars. After the affairs of Szegedin and Debreczin, Haynau's engagements on the Theiss, and the raising of the siege of Temeswar, it was in vain that Kossuth transferred the dictatorship to Görgei. Görgei, whether from treachery, as the other Magyar leaders maintain, or from necessity, as he himself avers, laid down his arms to the Russians at Vilagos (Aug. 13). The surrender of Komorn, in Sept., completed the subjugation of Hungary, which was treated as a conquered country, and the officers taken in Arad were dealt with by Haynau with a bloodthirsty rigor.

A. was now free to attend to politics, internal and external, and the spirit of the restoration soon showed itself. One important fruit of the revolution was retained—the liberation of the soil from the burdens and trammels of feudalism. All other liberal concessions very soon disappeared For a time, the forms of the constitution of Mar., 1849, were retained; but the rigorous military government and the surveillance exercised over the press, showed the tendency of things. The fundamental principles of the constitution turned out to the profit only of the Catholic church, which got rid of the placetum regium. In the beginning of 1851, Schmerling and Bruck, the liberal element of the ministry, retired; and in Aug. appeared a number of imperial decrees rendering the ministers accountable to the emperor alone. At last, Jan. 1, 1852, it was announced that the constitution and the fundamental rights were abolished, trial by jury set aside, the old press law revived, etc. This was followed by still greater concessions of influence to the clergy. The emperor did not conceal his predilection for absolute military government. All this was not effected without manifestations of discontent. The fires of revolution were still smouldering in Hungary and Italy; and in Lombardy, though still under strict military law, a tumult broke out, Feb., 1853, in which a number of officers and soldiers were stabbed. The finances, too, notwithstanding vigorous measures for improving the material resources of the country, continued in a bad state, so that incessant loans were required to cover the current deficit.

On the confused arena of German politics, the struggle for ascendency was kept up between A. and Prussia. In Oct., 1850, the two powers were armed and ready to come to blows; but the bold and determined policy of Schwartzenberg prevailed, and Prussia gave way. The points in dispute it might be difficult for any but a German to understand, even if it were worth trying. See GERMANY, HESSE-CASSEL. The result was that Prussia's scheme of a union was given up, and also A.'s admission with all her territories into the German confederation; and in 1851, the old diet was restored. After the death of Schwartzenberg, the foreign policy of A. was more conciliatory, and her interference in German affairs less dictatorial. Prussia and A., after Dec., 1852, were more friendly, on the whole, though the war in Italy gave rise to considerable ill-feeling between the two powers. In Feb., 1853, a commercial treaty was concluded, which was of the utmost consequence to the prosperity of A., as removing a great part of the obstructions to her commerce with the rest of Germany.

In 1853, a difference took place between A. and Turkey, which formed, as it were, a prelude to the war in the Crimea. In the quarrel between the Montenegrins and the porte, A. took the part of the Montenegrins; she had also complaints as to the infringement of rights possessed by her on the Adriatic coast, and regarding the treatment of Christians in Turkey. The threatening mission of count Leiningen, Feb., 1853, procured redress of these grievances. As if following up this movement, Russia came forward as the special protector of the Greek Christians of the Ottoman empire, and made demands on the porte which were held inconsistent with his sovereign rights. It was the interest of A., as well as of the rest of Europe, to maintain the integrity of the Ottoman empire; but although she united with England and France in endeavoring to settle the question by negotiation, when the war broke out, her peculiar relations to Russia led her to remain neutral during the contest.

The conduct of A. in Italy, especially after 1849, was such as to make that country a "standing menace to Europe." The government of A. in that portion of Italy of which she obtained possession by the treaty of 1815, was far from satisfactory; but what was chiefly complained of by the other powers was her interference in the affairs of the independent states of the peninsula. By means of secret treaties (copies of which were laid before the British houses of parliament this year, 1859), A. obtained a most undue influ-

ence in Parma, Tuscany, Modena, the States of the Church, and in the kingdom of the Two Sicilies. That influence was of course exercised in the interests of despotism, and in opposition to the welfare of the people, whose wishes their rulers, backed by Austrian troops, were enabled to set at defiance. The position of A. in Italy was canvassed at the meetings which followed the signing of the treaty of peace at Paris in 1856, but nothing resulted from the discussions. Sardinia seeing herself gradually environed by, and afraid to fall a victim to the prevailing Austrianism, after all remonstrances of a peaceful kind had failed, began to arm. A. demanded her immediate disarmament, on pain of war; but Sardinia, whose army was swelled with volunteers from every part of the peninsula, and who had previously entered into a treaty, offensive and defensive, with France, refused. A. accordingly commenced hostilities by crossing the Ticino on the 29th of April, 1859. On the 3d May, France, as the ally of Sardinia, formally declared war against A.; but in anticipation of what was to follow, she had several days before dispatched troops into Piedmont. The Austrian troops were beaten in every engagement that followed, and so effectually, that on the 6th July, the emperor, who latterly had taken the chief command of his army, was fain to conclude an armistice with the emperor Napoleon, who also commanded in person. On the 12th of the same month, the two potentates met at Villafranca, and agreed to come to terms of peace, the chief conditions of which were to be the cession of Lombardy to Sardinia. See ITALY. In 1866 a short and bloody war occurred between A. on the one hand, and Italy and Prussia on the other (see GERMANY), issuing in the cession of Venice to Italy, and the dual reorganization of the empire as described above. Since then, the Sclavonic Bohemians have continued to struggle in vain for the separate crown rights of their ancient kingdom. The part taken by the government in the Russo-Turkish war of 1877–78, which led to the occupation of Bosnia and Herzegovina, provoked very bitter feeling in the Hungarian section of the empire.

AUSTRIAN LIP, the thick lip so characteristic of the Hapsburgs, derived from Cymbarga, a niece of a king of Poland, who was noted for beauty and unusual strength.

AUTAU'GA, a co. in central Alabama, on the A. river; 650 sq.m.; pop. '80, 13,113—7292 colored. The soil is fertile; the surface uneven. There are several cotton and other factories. The Selma, Rome, and Dalton railroad touches the w. part of the county. Co. seat, Prattville.

AUTEUIL, formerly a country village at the entrance of the Bois de Boulogne, now inclosed within the fortifications of Paris. It is known as the residence of famous literary men—such as Boileau and Molière.

AUTHENTIC (Gr.) is a term applied to any writing or document, the contents of which may be depended upon for their truth or accuracy. It is frequently employed as synonymous with *genuine*, though a distinction has been drawn, especially by Biblical critics, between the two words. *Authenticity*, it is said, refers to the statements made by an author; *genuineness* to the authorship itself. Thus, we speak of a *History of England* as *A.*, when the narrative is admitted to be correct; and we say of such and such a gospel or epistle that it is *genuine*, when we are convinced that it is the composition of the writer to whom it is attributed. See bishop Watson's *Apology for the Bible*, and dean Trench's *Study of Words*. This distinction, however, appears to be artificial rather than real; that is to say, it does not inhere in the original signification of the words.

AUTHENTICS, the Latin translation of Justinian's *Novellæ* and a literal conveyance of the original. The term was applied to extracts from the decisions of the "Novellæ" by which previous decisions were set aside or modified. Two German emperors, Frederick I. and II., put forth A. in their own names, and ordered them to be inserted in the Justinian code.

AU'TO, entering into many compound scientific terms of Greek extraction, is the Greek pronoun *self*. In some compounds, it denotes the agent or subject, as in *autocrat, automaton, autonomy;* in others, the object, as in *autobiography, autocratic, autodidactic;* in others, again, a mere reference to the subject, as in *autochthonous*. This variation in the grammatical relation of *A.* sometimes occasions ambiguity in the meaning of the compound. Thus, *autograph* means both a machine that writes of itself, and also a writing done with the person's own hand; *autocracy*, both the mastery over one's self, and the sole rule or absolute authority over a people or state.

AUTOCH'THONES, according to Greek mythology, the first human pair who appeared in the world, and who, as the name implies, were believed to have sprung from the earth itself. Instead of only one pair for all lands, each district of Greece had its own A., who were supposed to have sprung from rocks, trees, or marshy places; the most peculiar and wide-spread belief being that which traced the origin of mankind to the otherwise unproductive rocks. Was there a shadow of Darwinism in the legend that the A. of Athens, Erysichthon, had legs like a serpent; or did it merely indicate that they were supposed to have come from a bog? The earth-born giants who made war upon the gods also had serpent legs. In Thebes the race of the Sparti were said to have sprung from a field sown with dragon's teeth, and the Phrygian Corybantes to have been forced out of hill-sides, like trees, by Rhea, the great mother. These originals of men in various countries were supposed to have lived like animals, in caves and woods, till by the

help of gods and heroes they reached a stage of civilization. A. is applied in a general way to indicate the original inhabitants of a country.

AUTOCRACY (Gr. *self-mastery* or *sole-mastery*) signifies that form of government in which the sovereign unites in himself the legislative and the executive powers of the state, and thus rules uncontrolled. Such a sovereign is therefore called an autocrat. Nearly all eastern governments are of this form. Among European rulers, the emperor of Russia alone bears the title of autocrat, thus signifying his constitutional absoluteness. —Kant used the word *A.*, in philosophy, to denote the mastery of the reason over the rebellious propensities.

AUTO DA FÉ (Port. Act of Faith) was the name given to the procession or ceremony that used to take place in Spain and Portugal at the execution of heretics condemned to death by the inquisition. It was generally held on a Sunday between Whitsunday and Advent, very often on All-saints day. At dawn, the dismal tolling of the great bell of the high church gave the signal to begin the drama of the day; for as such it was looked upon by the people, who thronged to it in troops, believing that they did a good work in merely looking on. Men of the highest rank reckoned it prudent to give their countenance to the "holy" tribunal at these processions, and even grandees of Castile did not disdain to make themselves familiars of the inquisition. The procession was led by the Dominicans, carrying the flag of the inquisition; next followed the penitents, on whom only penance had been laid; behind them, and separated by a great cross which was borne before, came those condemned to death—barefoot, clad in the sanbenito, and with a pointed cap on the head; then, effigies of the fugitives; and lastly, the bones of dead culprits, in black coffins, painted with flames and hellish symbols. The frightful train was closed by the army of priests and monks. The procession went through the principal streets to the church, where, after a sermon on the true faith, the sentence was announced. In the mean time, the accused stood before a crucifix with extinguished torches in their hands. After the sentence had been read to them, an officer of the inquisition gave each of the condemned a blow on the breast with his hand, as a sign that they were given over by that tribunal to the secular power; on which a secular officer took them in charge, had them fettered, and taken to prison. A few hours afterwards, they were brought to the place of execution. If they yet, at the last, made profession of the Catholic faith, they were so far favored as to be first strangled; otherwise, they were burned alive, and with them the effigies and bones of the fugitive and dead culprits. As a rule, the king, along with his whole court, had to exalt by his presence the solemnity of the horrid transaction. The most splendid auto da fé took place at Madrid, under Charles II., in 1680; the last was held as recently as towards the middle of last century.

AUTOGRAPH (Gr.) is a term applied to what is written with the person's own hand, and not by an amanuensis. In relation to manuscripts, it is used in opposition to a *copy*. The collection of autographs has, especially in recent times, become an object of eager pursuit, and consequently they form a branch of literary trade. Their value is determined by the interest felt in the writer, the scarcity of such relics of him, and the contents of the writing. Besides portraits of famous persons, we wish, particularly in the case of distinguished contemporaries, to possess a specimen of their handwriting, or at least their signature, as the peculiarity of the style—the physiognomy of the handwriting —completes our knowledge of their personality. Lithography is particularly serviceable in this matter, not only by supplying fac-similes for biographical and historical works and for portraits, but also by multiplying impressions of collected autographs, such as have appeared in England by Smith, in Holland by Nathan, and in Germany by Dorow. But deserving mention before all others are the *Isographie des Hommes Célèbres* (3 vols. Par. 1828–30), to which a supplement appeared in 1839; and the *Autographen-Prachtalbum zur 200 jährigen Gedächtnissfeier des Westfälischen Friedensschlusses* (fol. Leip. 1848). We possess an uninterrupted succession of the royal autographs of England from king Richard II. downwards. Fac-similes are to be found in *Autographs of Royal, Noble, Learned, and Remarkable Personages, Conspicuous in English History, from the Reign of Richard II. to that of Charles II.*, by John Gough Nichols (fol. Lond. 1829). The preface to the work contains some interesting notices.

AUTOL'YCUS, a Greek astronomer and mathematician of Pitane in Æolia, about 330 B.C., wrote on the revolving sphere, and on the rising and setting of the fixed stars. Both works, printed in Dasypodius's *Propositiones Doctrinæ Sphericæ* (Strasb. 1572), contain, for the most part, only such propositions of spherical astronomy as can be solved by means of a globe; and, instead of presupposing the knowledge of spherical trigonometry, they seem rather to prove that A. himself was unacquainted with it.

AUTOM'ATON is derived from two Greek words signifying self-movement, and is usually applied to machinery constructed to represent human or animal actions. The construction of automata has occupied the attention of mankind from very early ages. Archytas of Tarentum is reported, so long ago as 400 B.C., to have made a pigeon that could fly. Albertus Magnus and Roger Bacon, in the 13th c., are said—but there is some dubiety about the matter—to have made respectively a porter to open the door, and a speaking head. In France, in the beginning of the 18th c., many persons busied themselves in the construction of automata; and among other things, a pantomime, in

five acts, was represented by actors moved by machinery. The most perfect A. about which there is absolute certainty, was one constructed by M. Vaucanson, and exhibited in Paris in 1738. It represented a flute-player, which placed its lips against the instrument, and produced the notes with its fingers in precisely the same manner as a human being does. In 1741, M. Vaucanson made a flageolet-player, which with one hand beat a tambourine; and in the same year he produced a duck. This was a most ingenious contrivance, the mechanical duck being made to conduct itself in every respect like its animated pattern. It swam, dived, ate, drank, dressed its wings, etc., as naturally as its live companions; and, most wonderful of all, by means of a solution in the stomach, it was actually made to digest its food! An A., produced by M. Droz, drew likenesses of public characters; and, some years ago, Mr. Faber contrived a figure, exhibited in various places, Edinburgh among others, which, by means of certain keys, was made to articulate simple words and sentences very intelligibly, but the effect was not pleasant. The chess-player of Kempelen was long regarded as the most wonderful of automata. It represented a Turk of the natural size, dressed in the national costume, and seated behind a box resembling a chest of drawers in shape. Before the game commenced, the artist opened several doors in the chest, which revealed a large number of pulleys, wheels, cylinders, springs, etc. The chessmen were produced from a long drawer, as was also a cushion for the figure to rest its arm upon. The A. not being able to speak, signified when the queen of his antagonist was in danger by two nods, and when the king was in check by three. The A. succeeded in beating most of the players with whom it engaged; but it turned out afterwards that a crippled Russian officer—a very celebrated chess-player—was concealed in the interior of the figure. The figure is said to have been constructed for the purpose of effecting the officer's escape out of Russia, where his life was forfeited. So far as the mental process was concerned, the chess-player was not, therefore, an A.; but great ingenuity was evinced in its movement of the pieces. M. Houdin, the celebrated conjurer, was the inventor of some striking automata.—See Hutton's *Mathematical Recreations; Memoirs of Robert Houdin.* Lond. 1859. Chapman & Hall.

AUTON'OMY (Gr. *self-legislation*) is the arrangement by which the citizens of a state manage their own legislation and government; and this evidently may, with certain restrictions, be the case also within limited bodies of the same people, such as parishes, corporations, religious sects. The term A. is used to designate the characteristic of the political condition of ancient Greece, where every city or town community claimed the right of independent sovereign action. The idea of two or more town communities sinking their individual independence, and forming the larger aggregate unity which we understand by a state, seems to have been intolerable to the Greek mind.

AU'TOPLASTY, in surgery, the operation of renewing a portion of the body that has been torn away, by reinforcement from other parts; thus, a nose may be built up by strips cut from the arm or elsewhere. The art appears to be very old, and was practiced in India ages ago. Probably it arose from the desire to conceal the fact of infamous punishment which very often consisted in cutting off the nose or ears. If immediately rejoined the parts would grow together, and to prevent this the portions cut off were destroyed. But it was reasoned that if the parts cut off would grow together, any live flesh would do so. It was possible, therefore, to recruit a nose by a strip from the forehead or elsewhere. Celsus speaks of A. with reference to the nose and lips, and in the 15th c. it was practiced by Calabrian surgeons. In our days various improvements have been made, and now almost any injured part of the body's surface may be restored, often almost perfectly, by this art. There are several methods: one is to loosen the skin near the injured part and turn it down over the wound; another is to take the skin from the fleshy part of the limbs; and a third is to detach the skin for some distance on all sides and gently draw it over the place to be mended. The last method is considered much the best.

AU'TOTYPE, one of the names given to a peculiar kind of photographic print. Gelatine, to which bichromate of potash has been added, has the property of being, like paper, treated with certain salts of silver, sensitive to light, but in a different way. Light renders the bichromated gelatine insoluble, so that by the use of an ordinary photographic negative, we can produce a picture on the gelatine by exposure to light, as in the ordinary photographic printing process (see PHOTOGRAPHY). The picture so obtained is developed by removing with hot water those portions of the gelatine which have not been acted upon. Two groups of processes are founded on this property of bichromated gelatine. In the one, the gelatine is used for every copy of the picture; while in the other, it is only used to produce one picture, which is then made by various devices to serve as a printing matrix for throwing off, by mechanical means, many impressions. What is called carbon-printing comes into the first group, and an autotype is one kind of a carbon print. It is produced by simply mixing carbon or other pigment with bichromated gelatine, coating a sheet of paper with the mixture, and then exposing it to light under a negative as above described. When no pigment is used, the picture is merely in relief and depression, but the addition of carbon gives it ordinary light and shade, so as to resemble a print in ink. There are, however, some niceties in the manipulation, which we have not room to detail.

In those processes where the gelatine picture serves only as a matrix, electrotypes, impressions in soft metal, or other kind of reverses, are made, from which impressions can be taken mechanically, in any kind of printing ink. Photo-galvanography and the Woodburytype belong to this group.

AUTUMN, astronomically, the third season of the year; in the northern hemisphere covering the period from the sun's crossing the equinoctial, at the autumnal equinox, Sept. 22, till it is on the tropic of Capricorn, at the winter solstice, Dec. 22. Popularly, the A. in America is the three months of Sept., Oct., and Nov.; and in England Aug., Sept., and October. The American autumn is often considered the most delightful part of the year. S. of the equator the A. extends from the vernal equinox, Mar. 20, to the summer solstice, June 20.

AUTUN (Bibracte, Augustodunum), a t. in France, department of the Saône-et-Loire, in the Burgundian district of Autunois. Pop. '76, 11,358. It is situated on the river Arroux, is the seat of a bishop, and has a fine cathedral. Cloth, carpets, leather, stockings, and paper are manufactured in the place.—The ancient Bibracte was the chief city of the Ædui, and had a much-frequented Druid school; and at a later period, under the Romans, when it got the name of Augustodunum, it was no less famous for its school of rhetoric. A. was pillaged by the Saracens in 725, and nearly destroyed by the Normans in 888. There still exist at A. many ruins of Roman temples, gates, triumphal arches, and other antiquities. At the council of A. (1094), king Philip I. was excommunicated for divorcing his queen, Bertha.

AUVERGNE, a southern central district of France, was before the revolution a separate province, composing almost exclusively the modern departments of Cantal and Puy-de-Dome. Between the Allier and the upper course of the Dordogne and the Lot, A. rises into a highland region, having Bourbonnais, Limousin, and Rouergue, as terraces of descent into the western plains, while on the e. it joins the Cevennes and the southern highlands. Not only do the cone and dome-like shapes of the summits betray a volcanic formation, but also the great masses of basalt and trachyte that break through the crust of granite and gneiss, render it probable that this was a chief focus of plutonic action. Among the summits that have apparently been at one time volcanoes, the most remarkable are Cantal (6093), Mont-d'Or (6188), Puy-de-Dôme (4806), and Pariou; the latter, adjoining Puy-de-Dôme, is basin-shaped on the top, and one of the finest specimens of an ancient and extinct volcano; all are now covered with verdure. A. falls naturally into two divisions—upper A., to the s., and lower A., to the n.; in which last the valley of Limagne, on the left bank of the Allier, is distinguished for extraordinary fertility. The climate is colder in the mountainous districts than the southern position, with a less elevation, would lead us to expect, and is remarkable for furious winds and violent thunder-storms; but in the deep valleys the heat of summer is often oppressive. The lava-covered plateaus are desert, but the pulverized volcanic earths that cover the slopes and valleys form a rich and fruitful soil, as is shown by the crops of grain, garden produce, fine fruits, wine, abundance of chestnuts in the s., and of walnuts in the n., as well as by extensive thriving forests, along with flax and hemp fields and meadow-lands, in the poorer districts. Agriculture is in a rather neglected condition; but the breeding of cattle, especially of mules, is well managed. A. produces iron, lead, copper, antimony, and coal, and is rich in mineral springs.

The Auvergnese are a highland people, rude in their manners, poor, ignorant, at the same time honest and kind, though not free from the propensity to revenge. They live by cattle-keeping and agriculture, and by going to Paris as laborers. Domestic manufactures, therefore, remain confined to weaving, tanning, and paper-making. A. has, however, produced distinguished men. It was the native place of statesmen and warriors of the 15th and 16th centuries; and also of the Arnauld (q.v.) family, so distinguished in the history of Port Royal and of Jansenism. In more recent times, Lafayette and Polignac may be named. Chief towns, Clermont and Aurillac (q.v.). The country derived its name from the Averni, who long defended their fastnesses against Cæsar, as later against the Goths, Burgundians, and Franks, with whom they at last coalesced.

AUXERRE (anc. *Autissiodorum*), chief t. of the dep. of Yonne, France, stands on the Yonne, 90 m. s.e. of Paris. It is situated on the slope of a hill, in a rich and beautiful district abounding in vineyards. The city is mostly ill built; the streets are narrow, crooked, and dirty; but its aspect from a distance is very imposing, the most prominent feature being the cathedral church of St. Stephen, a grand and beautiful edifice which dates partly from the 13th century. The chapter of A. was once one of the richest in France. The churches of St. Germain and of St. Pierre (16th c.) are fine and interesting buildings. There is a curious old clock-tower over a gate-house, with an ugly skeleton spire of iron bars. The ancient walls of the city have been converted into boulevards. A. was a flourishing town before the Roman invasion of Gaul. It successfully resisted the Huns under Attila, who only ravaged its suburbs. Clovis took it from the Romans. After his death, it became part of the kingdom of Burgundy. The English took it in 1359, but it was retaken by Du Guesclin. Charles VII. gave it up to the duke of Burgundy. It was finally united to the kingdom of France by Louis XI. It has a communal college, a museum of antiquities, and a botanic garden. The principal manufactures are of strings for musical instruments, woolen cloths, hosiery, earthenware,

and leather. The Yonne becomes navigable here, and large quantities of Burgundy wines are sent down it to Paris; there is also a considerable export trade in timber and in charcoal. Pop. '76, 15,656.

AUXILIARY SCREW. See SCREW-PROPELLER.

AUXILIARY VERBS. See VERBS, CONJUGATION.

AUXONNE, a t. in France on the Saone, 17 m. s.e. of Dijon; pop. 5911. It is fortified, and has an arsenal and barracks, and manufactories of woolen and nails.

AUZOUT, ADRIEN, d. Rome, about 1693; a French astronomer. He and Picard applied the mural quadrant to the telescope, and A. made and applied a movable wire micrometer, by means of which he measured the daily variations in the moon's diameter, which Kepler had explained. A. was also an optician and a manufacturer of telescopes. He was one of the original members of the academy of science, founded in 1666.

AUZOUX, THÉODORE LOUIS, b. France, 1797; an anatomist and physician. He was known as the inventor of the method of making permanent models of anatomical preparations in *papier machie*, the special advantages of which are: lightness and strength of material; enlargement of minute parts; colors after nature; and the ease with which models may be dissected and put together in the smallest particulars. In 1825, he completed his invention and established a manufactory at St. Aubin. He has received many prizes up to the cross of the legion of honor. Some years ago he lectured, using his own models in illustration. He is the author of several works on surgical and medical themes.

AVA, a ruined city of Burmah, of which it has repeatedly been the capital, the honor having been transferred again and again between it and Monchobo, Sagaing, Amarapura, and Mandalay, the present capital. It stands in lat. 21° 51′ n., long. 95° 58′ e., on the bank of the Irawaddy, here about 4000 ft. broad. The river at this point receives two affluents, and these being joined by a canal, the city is rendered circumnavigable. The name is a Hindu and Malay corruption of Aengwa or Aaen-ua, meaning *fish-pond*, given it from being built where there were formerly fish-ponds, of which some still remain; but in official documents it is designated as Ratnapura, i.e., city of pearls. The city, which was 8 or 10 m. in circumference, was surrounded by walls and ditches. A. is now almost a desert, having been reduced to ruins by an earthquake in 1839.—On the opposite bank stands Sagaing, which has twice been the seat of government. The united pop. of the three cities of A., Sagaing, and Amarapura was at one time estimated at 400,000.

A'VA, ARVA, YAVA, or KAVA, *Macropiper methysticum*, a plant of the natural order *piperaceæ* (q.v.), possessing narcotic properties. Until recently, it was ranked in the genus *piper* (pepper). It is a shrubby plant, with heart-shaped, acuminate leaves, and very short, solitary, axillary spikes of flowers. It is a native of many of the South-sea islands, where the inhabitants intoxicate themselves with a fermented liquor prepared from its root or (more accurately) rhizome. The rhizome is thick, woody, rugged, and aromatic. A tincture of it is useful in chronic rheumatisms. The intoxicating liquor is prepared by macerating it in water. The savage Tahitians were accustomed to prepare it in a very odious manner; much as the Indians of the Andes prepare *chica* or maize beer—chewing the root, depositing it in a bowl, straining through cocoa-nut husk, and mixing with water or cocoa-nut milk, after which fermentation speedily ensues. The taste is unpleasant to those unaccustomed to it, and has been likened to that of rhubarb and magnesia. The intoxication is not like that produced by ardent spirits, but rather a stupefaction like that caused by opium. It is succeeded by a copious perspiration. The habitual use of A. causes a whitish scurf on the skin, which, among the heathen Tahitians, was reckoned a badge of nobility, the common people not having the means of indulgence requisite to produce it.—The leaf of the A. plant is in some places used with the betel-nut, instead of that of the betel-pepper.

AVADU'TAS, a sect of self-torturing fanatics among the Hindus, who put their bodies to such extremes of pain as to produce deformity. Begging is their means of subsistence.

AVALANCHES are masses of snow or ice that slide or roll down the declivities of high mountains, and often occasion great devastation. They have various names, according to their nature. Drift or powder avalanches (*staub lavinen*) consist of snow, which, loose and dry from strong frost, once set in motion by the wind, accumulates in its descent, and comes suddenly into the valley in an overwhelming dust-cloud. A. of this kind occur chiefly in winter, and are dangerous on account of their suddenness, suffocating men and animals, and overturning houses by the compression of the air which they cause. Another kind of A. resembles a land-slip. When the snow begins to melt in spring, the soil beneath becomes loose and slippery; and the snow slides down the declivity by its own weight, carrying with it soil, trees, and rocks. The greatest danger is where elevated tracts of moderate declivity are separated from the valleys by precipitous walls of rock; the softened snow of spring beginning to roll or slide on these slopes, is hurled over the precipices with fearful force into the valleys. The very wind

caused prostrates forests and houses. Ice A. are those that are seen and heard in summer thundering down the steeps, e.g., of the Jungfrau. They consist of masses of ice that detach themselves from the glaciers in the upper regions. They are most common in July, Aug., and Sept.

AVALLON (anc. *Aballo*), a t. of the dep. of Yonne, France, 26 m. s.e. from Auxerre, on a steep hill of red granite, nearly surrounded by the Cousin, which here flows through a ravine. Around the town runs a broad terrace-walk, shaded with lime-trees, about 500 ft. above the bed of the river. The surrounding country is fertile, yielding much wine and grain, and abounding also in excellent pastures, on which great numbers of cattle and sheep are fed. The town is generally well built, and has broad and clean streets. The church is ancient, and has a curious Romanesque portal. Manufactures of various kinds are actively carried on, particularly of woolens and paper; and there are distilleries, tanneries, glass-works, etc. There is also a considerable trade in the produce of the neighborhood. A. is a very ancient town, of Celtic origin. It was sacked by the Saracens in 731 A.D., and by the Normans in 843; taken by Charles VII. in 1433, retaken by Philip the good, duke of Burgundy, in 1455; and pillaged by the troops of the league in 1593. Pop. '76, 5337.

AVA'LOS, FERDINANDO FRANCESCO D', 1490-1525; Marquis of Lescara, and one of Charles V.'s Italian officers. When a mere boy he married Vittoria Colonna, to whom he was affianced when she was but four years old. At the battle of Ravenna he was wounded and made prisoner, but was soon ransomed, and gained distinction at the fight at Vicenza, 1513; at Milan, which he took from France in 1521; at Como; and in several other engagements, including the plundering of Genoa. He won the highest distinction in the great victory over Francis I. at Pavia, 1525, and was made generalissimo. But he ruined his fame by joining the conspiracy to drive the Germans and Spaniards from Italy, and then betraying the plot to the emperor. His reward was to have been the crown of Naples, but his wife induced him to decline it.

AVAN'TURINE, a variety of quartz, remarkable for the brilliancy with which it reflects light, which is supposed to result from small particles of mica inclosed in it. It is of a yellow, red, or brown color. It is used in jewelry, but is not so much valued as amethyst or Cairngorm stone. It is found in India, Spain, and Scotland.

AVA'RI, a tribe of eastern origin, made their appearance 100 years later than the Bulgarians, in the countries about the Don, the Caspian sea, and the Volga. One part of them remained at the Caucasus, another part pressed forward (about 555 A.D.) to the Danube, and settled in Dacia. Here they served in Justinian's army, and assisted the Lombards to overturn the kingdom of the Gepidæ; and, about the end of the 6th c., under the mighty Khan Bajan, they conquered Pannonia. Later they made themselves masters of Dalmatia; made devastating incursions into Germany, as far as Thuringia; and into Italy, where they warred with the Franks and Lombards, and extended their dominion over the slaves living on, and northwards from, the Danube, as well as over the Bulgarians as far as the Black sea. These nations at last rose against them, and, in 640 A.D., drove them out of Dalmatia. Confined to Pannonia, they were subdued by Charlemagne, and well-nigh extirpated by the Moravians, so that, after 827, they disappear from history. They usually surrounded their settlements with fortifications of stakes driven into the ground, and earth, of which traces, under the name of Avarian rings, are yet found in the countries formerly occupied by them. The results of the most recent criticism show that, in all probability, the A. belonged to the same great Turanian stock as the Huns, and that their original residence was the land lying e. of the Tobol, in Siberia.

AVAST, one of the peculiar terms employed on shipboard. It is a command to stop or cease in any operation going forward—such as, "avast heaving."

AVATAR' primarily signifies, in Sanscrit, a descent, but is specially applied to the descent of a Hindu deity upon the earth in a manifest shape, either for beneficent of for retributive ends. It is thus almost synonymous in its signification with the Christian term *incarnation*. The word is sometimes rhetorically employed in English literature. The avatars of Vishnu (q.v.) are the most famous in Hindu mythology.

AVAT'CHA, a mountain and bay of Kamtchatka. The bay is on the e. coast, being by far the best harbor of the whole peninsula, and containing the capital city of Petropaulowsk (q.v.). The mountain, 9055 ft. in height, is about 20 m. to the n., and not far from the sea, in lat. 52° 15′ n., and long. 158° 50′ e. It is a volcano with two craters—one at the summit, and the other rather more than half-way up, on the seaward side.

AVEBURY, A'BURY, or A'BIRY, a small village of Wiltshire, situated in n. lat. 51° 25′, and w. long. 1° 50′, 25 m. n. of Salisbury, and 6 w. by n. of Marlborough. It is a place of no importance in itself, having a pop. of 769; but it is remarkable as the site of the largest so-called Druidical temple in Europe—in fact, occupying the most of the sacred inclosure itself—and as having in its neighborhood several remarkable barrows and cromlechs of remote antiquity.

What is called the temple occupies a flat area of ground on the s. of the Kennet, a diminutive tributary of the Thames. It consists, or rather consisted, of a hundred large

blocks of stone, placed on end in a circular form, around a level area of about 470 yards in diameter, bounded by a deep ditch and a high embankment forming the inclosure. There are also the remains of two small circles of stones within the inclosure, supposed to be inner temples. Of these, one consisted of two concentric circles of 43 upright stones, having a single stone near the center; the other, a similar double circle of 45 stones, to the n.w. of the former, with three large and high blocks in the center. The stones that remain of this ancient work are not of uniform size; they measure from 5 to 20 ft. in height above the ground, and from 3 to 12 in breadth and thickness.

The embankment, which is broken down in several places, had originally two entrances to the temple, eastward and westward, from which issue two long walks, bending round to the southward, each furnished with a range of blocks on either side similar to those of the temple itself. These avenues are each upwards of a mile in length, the width varying from 56 to 35 feet. That which issues to the e., or rather s.e., after turning southward, bends near its extremity to the s.e. again, and closes on a knoll called Overton hill in two concentric oval ranges of blocks. That which issues to the w. also bends to the s., and then to s.w., ending in a point with a single block.

Of the surrounding antiquities, that which appears most closely connected with the temple is a large barrow, or lofty conical mound, called Silbury hill, lying due s. of it, at a distance of three quarters of a mile. It is situated nearly midway between the two avenues, in the line of the ancient Roman road between London and Bath. Close to the base, it measures 2027 ft. in circumference; the sloping height is 316 ft.; the perpendicular height, 170 ft.; the diameter of the level area at the top, 120 ft.; the space covered by the whole work, over 5 acres. What proves the structure to have been more ancient than the time of the Romans, if such proof were necessary, is that the Roman road, as it comes from the w., is straight for several miles till it reaches Silbury, when it bends round it to the s., and again proceeds in a direct line to Marlborough.

About a mile n. of A. there are remains of a large cromlech, the stones of which have been overturned; and about 3 m. e. there is another, which has two upright blocks standing apart, with a larger one surmounting them. In the neighborhood, all round the Marlborough downs, there are remains of earthworks and upright stones, and the sites of other antiquities now nearly obliterated.

Very little was known of A. temple and the antiquities in its vicinity till the year 1740, when Dr. Stukeley, a somewhat fanciful antiquary, published his work, *Stonehenge and Abury, Two Temples Restored to the British Druids;* although Aubrey, an ardent student of antiquarian lore, had written an account of them in 1663, by command of Charles II., the manuscript of which still exists. None of the earlier topographers or antiquaries appear to have left any description of them. When Sir Richard Hoare, in collecting materials for his *Ancient Wiltshire*, made his examination of them in 1812, 72 years after the appearance of Stukeley's work, and 164 after the first survey by Aubrey, a great number of the stones had disappeared, and in many places it was difficult to trace out even the plan of the works. In 1849, in order to satisfy the curiosity of the lovers of antiquity as to the nature and intention of the great barrow, Silbury hill, a tunnel was cut to its center, but nothing was discovered to throw light on the subject. Some modern archæologists altogether reject the conclusions of Stukeley and his followers, and call for proof of any connection between the Druids and the stone circles which it has been the fashion for the last century to call Druidical.

AVE'IRO, a maritime t. of Portugal, in the province of Beira, between Oporto and Coimbra, situated in an unhealthy locality at the mouth of the Vouga, which forms a wide but shallow harbor, is the see of a bishop, has 5000 inhabitants, and trades in oil, wine, oysters, sardines and other fish, oranges, and sea-salt.

AVE'IRO (anc. *Avreium*), a city of Portugal, in the province of Beira, 31 m. n.w. from Coimbra. It is situated on the Ria d'Aveiro, a salt lake or lagoon, extending five leagues to the n., and separated from the sea by a narrow bar of sand. Into this lake the Vouga, the Antua, and some smaller rivers flow. During a year of great drought, the sand-bar closed up the seaward opening, a vast mass of sand quickly accumulated, and the low grounds were inundated, the water of the rivers escaping only by filtering through the sand. In summer, the lake thus made is partially dried, and marshes are formed, the effluvia from which have rendered the city very unhealthy, so that its pop. has fallen from 14,000 to 5000, its present number. In 1808, the government opened a new passage through the sand-bar, and executed other works which dried part of the inundated grounds, and improved the sanitary conditions of the city, which, however, are far from being good. A. is a bishop's see, but its cathedral is "a squalid and tawdry room, up one pair of stairs." It is a place of considerable activity; it has manufactures of earthenware, but the chief article of trade is salt, which is made in the marshes in summer. Other important articles of trade are fish, wine, oil, and oranges. The anchovy, sardine, herring, and oyster fisheries are actively prosecuted. The city has a deserted appearance. Its streets are narrow and dark, and seamed with filthy canals of salt-water.

AVEL'LA (anc. *Abella*), a t. of central Italy, in the province of Avellino, 20 m. e.n.e. from Naples. It is delightfully situated in a hilly district, and commands a very extensive view. A ruined castle marks the site of the ancient city, which was founded by one

of the Greek colonies from Chalcis, and was celebrated in Roman times for its apples and pomegranates. Virgil speaks of it as *malifera Abella*. Pop. of commune, 5228.

AVELLANE'DA, GERTRUDIS GOMEZ, DE, 1816–64; poet and novelist; the daughter of a Spanish naval officer. In 1840, she produced, in Madrid, a successful drama, *Leonicia*, and in 1845 was awarded a laurel crown for a poem praising the queen's clemency. Two vols. of lyrics, 8 vols. of prose, and 16 dramas are of her production.

AVELLI'NO (anciently, *Abellinum*), chief t. of the province of the same name in the s. of Italy. It is situated at the foot of monte Vergine, on which is the famous monastery founded by S. Guglielmo da Vercelli, on the ruins of a temple of Cybele, in 1119. Pop. 20,000. A. suffered greatly from earthquakes in 1694, 1731, and 1805. It has manufactures of woolens, paper, macaroni, and considerable trade in corn and hazel-nuts. The *nuces Avellanæ* were famous even in Pliny's time. Between A. and Benevento is the Val de Gargano, where the Samnites defeated the Romans in 433 A.U.C. Pop. of province, '71, 375,691.

AVELLI'NO, a province in s. Italy, 1409 sq.m.; pop. '71, 375,691. It is a mountainous region, but with fertile soil, yielding good harvests. It is watered by the Calore and Ofanto rivers. Chief t., Avellino.

AVÉ MARI'A, also ANGEL'ICA SALUTA'TIO, or the angelic salutation, are names given by the Roman Catholics to a very common form of address to the Virgin Mary. *Ave Maria* are the first two words of the prayer, in Latin, which is taken from the angel Gabriel's salutation (Luke i. 28): "Hail, Mary, highly favored, the Lord is with thee; blessed art thou among women, and blessed is the fruit of thy womb." In this form, according to an ordinance of Gregory I., the invocation was at first said by the priests during mass, on the fourth Sunday after Advent. With the extended worship of the Virgin since the 11th c., the A. M. appears as a lay-prayer of nearly equal use with the Paternoster, and was sanctioned as such at the end of the 12th century. Accordingly, not only did Urban IV. (1261) add the concluding words, *Jesus Christus, Amen*, but since the first half of the 16th c., the prayer began to receive, more and more commonly, as an addition to the old formula, what constitutes the conclusion of the modern form: "Holy Mary, mother of God, pray for us sinners, now and at the hour of our death, Amen." An edict of John XXII. (1326) ordains that every Catholic shall, morning, noon, and evening, at the warning of the bells, repeat three aves. This ringing of bells as a summons to morning, midday, and evening prayers, is retained in some Protestant countries, and is still called the A. M., or Angelus Domini. The aves are reckoned by the small beads of the rosary, which are hence called Ave Marias, while the large beads are devoted to the Paternoster. 150 Ave Marias form—after the 150 Psalms— a *Psalteriam Mariæ*, and are thought to possess high propitiatory power.

AVEMPACE (ABU BEKR MOHAMMED IBN JAHYA), probably b. in Saragossa near the close of the 11th c., d. at Fez, 1138; the earliest and one of the most distinguished Arab philosophers in Spain. He was a physician, mathematician, astronomer, and poet, though now known only from his metaphysical speculations. The most important of his works, and one noticed by Averrhoes, is *Regime, or Conduct of the Solitary*, which the author set forth as a system of rules by which man may rise from the life of the senses to the perception of pure intellectual principles, and may participate in the divine thought which sustains the world.

AVE'NA. See OAT.

AVENBRUG'GER. See AUENBRUG'GER.

AVENGER OF BLOOD. See BLOOD, AVENGER OF.

A'VENS. See GEUM.

AVENTI'NUS, JOHANNES THURMAYR, a scholar and historian, b. at Abensberg, Bavaria, where his father was a publican, in 1476. Having studied at Ingolstadt, he went to Paris, where he took the degree of M.A. He afterwards taught Greek and mathematics at Cracow, and poetry and eloquence at Vienna. In 1512, the duke of Bavaria called him to Munich, and intrusted him with the education of his sons. Here A. wrote his esteemed *History of Bavaria* (Annales Boiorum), a work which occupied him sixteen years. This work was not published until twenty years after his death, which took place in 1534, and then only with large portions, more true than pleasant, about the Romish church, excised. These, however, were all restored in Cisner's edition of 1580. A. wrote several other learned works.

AVEN'TURINE, the name of certain specimens of feldspar and quartz having the property of reflecting or refracting light in various colors from points inside the stone. In some cases the effect is produced by the presence of mica in small scales. A. is imitated by the Venetian glass makers, who outdo the original in beautiful effects. The name signifies "accident," and the discovery is said to have come from the dropping of brass filings into melted glass.

AVENZO'AR (ABU MERWAN ABDALMALEC IBN ZOHR), 1072–1162; a Spanish Arabian physician, pupil of his father. He made earnest efforts to reduce medicine to the plane of experimental science. Some of his works have been published, and one is spoken of by Averrhoes.

AVERAGE. If any number of unequal quantities are given, another quantity may be found of a mean or intermediate magnitude, some of the given quantities being greater, and others less, than the one found, which is called the average. The exact relation is this: that the sum of the excesses of the greater above the A. is equal to the sum of the defects of the less below it. If there are, say, 7 vessels unequally filled with sand, and if we take handfuls from the greater, and add these to the less, until the sand is equally distributed, then any one of the equalized measures of sand is the A. of the 7 unequal measures. If the quantites of sand in the several vessels are stated in numbers, as 5, 10, 12, 8, 11, 14, 3 oz., the A. is found by adding together the numbers, and dividing by how many there are of them—viz., 7. The sum being 63, this, divided by 7, gives 9 oz. as the A. The system of averaging is a very important and time-saving one. By averages, the farmer calculates the value of his crops; the grazier, the value of his cattle; and the forester, the value of his trees. Reflection, however, requires to be exercised in striking averages; otherwise, serious errors may be committed. If a farmer, for instance, has three lots of cattle, the first of which he averages at £25 a head, the second at £15, and third at £9, it might be thought that the A. of the whole stock made up of the three lots would be got by taking the mean of £25, £15, and £9—viz., $\frac{25+15+9}{3}$=£16⅓. But this would be correct only if there were an equal number of cattle in each of the lots. To get the real A. in case of the lots being unequal, he must multiply the A. of each lot by the number of cattle in it, add the three products together, and divide by the whole number of cattle in all three lots taken together. If we suppose 9 head in the first lot, 20 in the second, and 15 in the third, the A. is $\frac{25\times9+15\times20+9\times15}{9+20+15}$=£15.

AVERAGE (in marit. law). A rule was established by the Rhodian law (q.v.), and has prevailed in every maritime nation, that where a loss has been sustained, or expense incurred, for the general safety of the ship and cargo, a contribution should be made, in proportion to their respective interests, by the owners of the ship, freight, and goods on board; or, in modern times, by the insurers of these. To this contribution the name of *general A.* is given. The apparel, jewels, and other personal property of the passengers, not carried for purposes of traffic, and the seamen's wages and provisions, are not liable for any share in this contribution. Goods thrown overboard are now estimated at the price they would have yielded at the port of delivery at the time, freight, duties, etc., being deducted. See JETTISON. *Particular A.*, again, is the loss of an anchor, the starting of a plank, the leaking of a cask, the loss of goods washed from the deck, or the like, where the common safety was not in question, and where there is, consequently, no contribution. To losses of this description, the term A., though generally, is incorrectly applied. *Petty averages* are the duties of anchorage, pilotage, etc. If these occur in the ordinary course of the voyage, they are not loss, but simply part of the expense necessarily incurred. But if they have been incurred in extraordinary circumstances, and for the purpose of avoiding impending danger, they are a loss which is included in the general A., and covered by the contribution. *A. bond* is a deed which parties liable to a general A. are in the habit of executing, by which they empower an arbiter to value the property lost, and fix the proportion which shall be borne by each proprietor.

AVERDUPOIS. See AVOIRDUPOIS.

AVERELL, WILLIAM W., b. N. Y., 1830; a graduate of West Point; served on the frontier and in the war against the rebellion, rising from lieut. of mounted riflemen to maj.gen. He resigned in 1865, and in the next year was appointed consul-general to the dominion of Canada.

AVER'NUS, in Gr. *Aornos*, or "without birds," called now Lago d'Averno, is a small, nearly circular lake in Campania, Italy, situated between Cumæ, Puteoli, and Baiæ. It is about a mile and a half in circumference, and occupies the crater of an extinct volcano. It is in some places as deep as 180 ft., and is almost completely shut in by steep and wooded heights. The sulphureous and mephitic vapors arising from the lake were believed in ancient times to kill the birds that flew over it; hence, according to some, its Greek appellation. Owing to its gloomy and awful aspect, it became the center of almost all the fables of the ancients respecting the world of shades. Here was located Homer's Nekyia, or entrance to the under-world; here the Cimmerians are said to have dwelt—a people who lived in deep caverns, without ever coming into the light of day, explored metals, and imparted Stygian oracles; here also were placed the grove of Hecate and the grotto of the Cumean Sibyl. Agrippa caused the dense woods to be thinned, by which the place lost much of its wildness; and by his orders Cocceius constructed the famous tunnel through the mountain to Cumæ, a work of comparative ease, considering that the hills round about are composed of volcanic tufa. The lake was also connected in ancient times with the gulf of Baiæ.

AVERRHO'A. See CARAMBOLA.

AVERRHOES', properly, Ibn Roshd, or more fully, Abul-Walid Mohammed-Ibn, Ahmed-Ibn, Mohammed-Ibn-Roshd, the most famous of the Arabian philosophers, was

b. at Cordova, in Spain, in 1149. His father, who was chief judge and mufti, instructed him in Mohammedan jurisprudence. In theology and philosophy, he had Thophail for his teacher; and in medicine, Ibn Zohr, the elder. His talents and acquirements made him be appointed successor to his father, and afterwards chief judge in the province of Mauritania. Being accused, out of envy, of a departure from the orthodox doctrines of Mohammedanism, he was dismissed from his office, and condemned by the ecclesiastical tribunal of Morocco to recant his heretical opinions, and do penance. After this, he returned to his native place, and lived in great poverty until the caliph Almansor reinstated him in his offices, on which he went back to Morocco, where he died in 1198 or 1206. A. regarded Aristotle as the greatest of all philosophers. He translated and illustrated Aristotle's writings with great penetration; but the influence of the Alexandrine view laid down in the commentaries of Ammonius, Themistius, and others, is easily seen in his works, as in those of most of the Arabian philosophers. In opposition to the Arabian orthodox school, especially against Algazali, A. stood forth on the side of reason as the defender of philosophy. The Arabians called him, by way of eminence, the expositor (of Aristotle). Most of his writings are known to us only through Latin translations (Ven., 1489). The Arabic text of A.'s philosophical works was published at Munich in 1859 by M. J. Müller, whose German translation of the same appeared in 1875. His commentaries on Aristotle appeared in an addition of that philosopher's works (11 vols., Ven., 1560). He also wrote a sort of medical system, which, under the name of *Colliget*, was translated into Latin, and repeatedly printed. The philosophy of A. attained to importance in the Christian church as early as the 13th c., although his pantheistic doctrine of the unity of the active principle in the universe was often repudiated as an error, and astrology was characterized as Averrhoism. See Renan's *Averroës et l'Averroïsme.*

AVER'SA, a t. of southern Italy, in the province of Caserta, is situated between Naples and Capua, 9½ m. s. of the latter, in a beautiful district rich in oranges and wine. It is well built, with 20,000 inhabitants; has a cathedral, and a number of monasteries, in one of which Andrew of Hungary, the Darnley of Neapolitan history, was murdered with the connivance of his wife, the beautiful but guilty Joanna, queen of Naples; an excellent asylum for the insane, established by Murat; and a foundling hospital. A. was built in 1029 by the Normans on a territory ceded to them by duke Sergius of Naples, to be held in fief. About 2 m. from A. are still to be seen a few ruins of the Oscan city of Atella, famous as the birthplace of the satirical farces so popular on the Roman stage.

AVERY, Waitstill, 1745–1821; b. Conn.; a patriot of the American revolution. He was one of the signers of the Mecklenburg declaration, a member of the Hillsborough congress, of the North Carolina congress, and first attorney-general of the state. During the war he was in active service as col. of militia.

A'VĒS. See Birds.

AVEYRON, a river and department in the s. of France. The river rises near Severac-le-Château; flows, for the most part, in a westerly direction through the department of the same name; and, after a course of 90 m., falls into the Tarn—a feeder of the Garonne—below Montauban. It touches in its course the towns of Rhodez, Villefranche, and Negrepelisse.—The department of A. has an area of 3370 sq.m., and is one of the most mountainous parts of France. Situated between the highlands of Auvergne and the Cevennes, it slopes like a terrace s.w. to the Garonne, to the basin of which the department belongs. The principal rivers flow through the department from e. to w., and between these, several ramified offsets from the chain of the Cevennes traverse the country. The climate is healthy, but cold and raw, especially in the north and east. North of the Lot, only rye and oats are grown; in the rest of the valleys, other kinds of grain also thrive, as well as fruit, chestnuts, potatoes, and truffles. A third part of the land is unfit for cultivation, but affords excellent pasture for the numerous herds of cattle, goats, and sheep, which, along with the breeding of swine, form the principal resources of the mountaineers. 18,000 cwt. of cheese is sold yearly under the name of Roquefort cheese. The mineral wealth of the department is considerable. Coal, iron, lead, zinc, copper, vitriol, alum, and antimony are found in abundance, the mining, preparing, and sale of which form a principal means of support to the (1876) 413,826 inhabitants. Besides these, the principal employments are paper-making, cotton-spinning, tanning, the manufacture of woolen cloth and carpets, etc. The seat of the departmental courts is Rhodez, which is also a bishop's see.

AVEZAC, Auguste Geneviéve Valentin d', 1777–1851. He was a native of Hayti, a lawyer, and practiced with success in New Orleans. He had also practiced medicine. After service in the war of 1812 he settled in New York. President Jackson made him minister at the Hague in 1831, and he again filled the office in 1845–49.

AVEZZA'NA, Joseph, b. Italy, 1797, d. 1879. He fought under Napoleon, 1813–14; served in the Sardinian army in 1821, in which year he was sentenced to death and hanged in effigy for taking part in a students' insurrection in Turin. He fled to Spain, took part in a revolution, was captured, and escaped being shot only by the intervention of an English consul. Next he appeared in Mexico, where he fought the Spaniards and won the rank of gen., and was for a time commander-in-chief of the troops of the

republic. In 1834, he came to New York, married an Irish lady, and engaged in mercantile business. On the outbreak of the revolution of 1848, he returned to Italy, and was in command of the national guards of Genoa. After an unsuccessful struggle he went to Rome, then under republican government, and was made minister of war and commander-in-chief of the army. Being unsuccessful, he fled in disguise with Garibaldi to New York. In 1860, he went back and joined his old chief in the campaigns which resulted in freeing Italy from her petty tyrants. He was elected many times to the Italian parliament, and, when he died, was chief of the "Italia Irredenta" society. He was at one time U. S. consul at Genoa.

AVEZZA'NO, a t. of s. Italy, in the province of Aquila, 22 m. s. from Aquila. It is situated in a beautiful and fertile plain, covered with almond trees and vineyards, about a mile from lake Fucino. It has a large square, in which is a palace of the Colonna family. The town belongs to the Barberini family, whose baronial castle is a conspicuous object from the shores of the lake. The castle and some of the churches contain numerous ancient marbles with inscriptions recovered from the lake. The present town is about 2 m. distant from the site of Alba, the city of the Marsi, celebrated in the history of the Roman republic, which occupied the crest of a hill; a small village on the site still retains the name of Alba. Pop. 5200.

A'VIARY, a place for keeping birds. The arrangements of an A. depend upon the habits of its inmates, the climate suited to them, and other circumstances. A bird-cage is a domestic aviary. Aviaries on the largest scale are to be seen in zoological gardens.

AVICEBRON', or SALOMON BEN GABIROL, about 1045-70; a Jewish writer on philosophy and metaphysics, of Saragossa, Spain. Jews knew him only from his poems, but Christian schoolmen of the century following his time were much influenced by his works, in a Latin translation called *Fons Vitæ*, or *Sapientiæ*, wherein A. sets forth his idea of the objects of metaphysics.

AVICEN'NA, properly, Ibn Sina, or, more fully, Abu Ali Al-Hossein Ibn Abdallah Ibn Sina, a famous Arabian philosopher and physician, whose authority for many centuries passed for indisputable, was b. 980, at Charmatain, a village near Bokhara, where he received a very learned education. He studied with special fondness mathematics, astronomy, philosophy, and medicine. He was physician to several of the Samanide and Dilemite sovereigns, and also for some time vizier in Hamadan, but afterwards retired to Ispahan, and died during a journey of the Emir Ala-ed-Daula to Hamadan in 1037. He left a multitude of writings, among which his system of medicine, *Kanun fi 't-Tibb*, acquired the greatest reputation. It is distinguished less by originality than by an intelligible arrangement and judicious selection from the writings of the Greek physicians, at a time when the knowledge of Greek was not widely spread. A. himself knew the Greek writers only through Arabic translations. The Arabic text of the *Kanun*, and of several of his philosophical writings, among which those on metaphysics especially attracted the attention of the schoolmen, appeared at Rome, 1593, in 2 vols. The *Kanun* was translated into Latin by Gerardus Cremonensis, and repeatedly printed (Ven., 1595, 2 vols.). His philosophical writings have also appeared several times in Latin translations (Ven., 1490, 1523, 1564).

AVICEN'NIA, a genus of plants of the natural order *avicenneæ* or *myoporaceæ*, an order very nearly allied to *verbenaceæ* (q.v.), and almost exclusively confined to the southern hemisphere. The genus A. consists of trees or large shrubs resembling mangroves, and, like them, growing in salt-swamps. Their creeping roots, often curving for the space of 6 ft. above the mud before they stick into it, and the naked asparagus-like suckers which they throw up, have a singular appearance. *A. tomentosa*, the white mangrove of Brazil, has cordate ovate leaves, downy beneath. Its bark is much used for tanning. A green resinous substance exuding from *A. resinifera* is eaten by the New Zealanders. —The genus is named in honor of the Arabian physician Avicenna.

AVIC'ULA. See PEARL OYSTER.

AVIGLIA'NO, a t. of s. Italy, in the province of Potenza, 10 m. n.w from Potenza, on one of the head-waters of the Sele, near the bifurcation of the Apennines. It stands on the brow of a hill, part of which gave way, after long-continued rains in 1824, carrying with it a portion of the town. A. has an elegant collegiate church. The pastures of the neighborhood are celebrated for their large and fine oxen. Pop. '71, 11,336.

AVIGNON (*Avenio Cavarum*), a city of Provence, in the s. of France, capital of the department of Vaucluse, is situated on the left bank of the Rhone, which is here crossed by a long bridge. The pop. is (1876) 33,189; the streets are narrow and crooked. There is a multitude of churches and religious establishments, among which the cathedral on the Rocher des Dons and the church of the Franciscans, as well as the old papal palace and the tower Glacière, are distingulshed. The dominican convent now serves as a cannon-foundry. The city is the see of an archbishop, has a museum and picture-gallery, and several other valuable institutions. The university, founded in 1303, was abolished in 1794. A. has manufactures of silk, silk-dyeing, tanning, iron founding, etc., and is famous for its garden produce, its fruit, wine, honey, etc. The country about A. is delightful, and extremely fruitful in corn, wine, olives, oranges, and lemons.

—In A., Petrarch spent several years; it was here he saw Laura, whose monument is to be found in the Franciscan church. Vaucluse, which he has immortalized, lies about 3 leagues from Avignon. A. was the capital of the ancient Cavares, and presents many remains of the times of the Romans. In the middle ages, it formed, with the surrounding district, a co., which the popes, who had already received the co. of Venaissin as a gift from king Philip III., bought in 1348 from Joanna, queen of Naples and countess of Provence. The pope governed both counties through a vice-legate, and continued in the possession of them till 1790, when, after several stormy and bloody scenes, the city with its district was united with France. At the peace of Tolentino, 1797, the pope formally resigned A. and Venaissin. A. is celebrated in ecclesiastical history as being, for a time, the residence of the popes. By order of Philip IV., of France, pope Clement V. and six of his successors from 1309 to 1377, were obliged to reside there. It was afterwards the residence of more than one anti-pope. Two ecclesiastical councils were also held at A. (1326 and 1337): the first took into consideration the relation of the clergy to the laity; the other, the bad training of the clergy.

AVILA, a t. of Spain, capital of the province of A., in Old Castile, 53 m. n.w. of Madrid; pop. 6000. The Spaniards declare that its original name was Abula, and please themselves and amuse strangers with the belief that it was built by Hercules 1660 B.C. It is the birthplace of two highly remarkable persons—the first was the learned Alfonso Tostado de Madrigal, who d. in 1455, and whose doctrines (according to his biographer) were so enlightened that they caused the blind to see, though, in the opinion of Don Quixote, he was more voluminous than luminous; the second is "Our Seraphic Mother, the Holy Teresa, Spouse of Jesus," b. Mar. 28, 1515; she was made the lady-patroness of Spain by Philip III., and shares the honors of worship with St. James. A. is the see of a bishop, with a beautiful cathedral, and was at one time one of the richest and most flourishing cities of Spain. The university, which had been founded in 1482, and enlarged in 1638, was abolished in 1807. It was at A. that the nobles of Old Castile assembled in 1465 to depose king Henry IV., and raise his brother Alfonso to the throne of Leon and Castile. At A., also, was held the meeting of the so-called Third Estate, or of the Holy League, in 1520, under the leadership of Juan Padilla, to which nearly all the cities of Castile sent representatives.

AVILA, a province in Spain; 2569 sq.m.; pop. '70, 175,219. It is bounded n. by Valladolid, e. by Segovia, s. by Toledo, and w. by Salamanca. The n. part is level, with marl soil not especially productive, and has a climate ranging from extreme heat to extreme cold; agriculture is the chief occupation. The s. part is a mass of rugged ridges, with a few well-watered and fertile valleys; the winter is long and severe, but the climate is healthful; cattle-raising is the main business. Five small rivers intersect the province. There are minerals in the mountains, but no mines are worked. Quarries of marble and jasper yield some profit. Merino wool has been the principal product; but all industries are repressed by feudal rights and laws of entail and mortmain. Game is plentiful, and fish are abundant. Silk worms are cultivated; oil, olives, chestnuts, and grapes grow naturally. There is very little trade or manufacturing industry.

AVILA Y ZUNIGA, DON LUIZ DE; a Spanish general, diplomatist, and historian, b. at Placencia, in Estramadura, enjoyed the favor and confidence of Charles V., who intrusted him with embassies to the popes Paul IV. and Pius IV., and made him grand master of the order of Alcantara. He accompanied the emperor on his expeditions to Africa and against the princes of the league of Schmalkald, and wrote an account of the war which goes under that name, partial, indeed, but able and spirited. The *Commentarios de la Guerra de Alemanna hecha por Carlos V. en* 1546 *y* 1547, have been published repeatedly (first Ven. 1548), and translated into several languages.—AVILA, GIL GONZALEZ DE, b. at Avila, in Old Castile, in 1559, and d. in 1658, was a Jesuit and canon of Salamanca; also royal historiographer for Castile and the Indies. He composed a great number of historical works, of which the following may be mentioned as containing many valuable facts: *Historia de la Vida y Hechos del Rey Don Henrique III. de Castilla* (Madr. 1638); *Historia de la Vida y Hechos del Monarca D. Filipe III.* (in Mendoza's *Monarquia de España*, 3 vols. Madr. 1770); *Historia de Salamanca* (Salam. 1606); and the *Teatro Ecclesiastico de la primitiva Iglesia de las Indias Occidentales* (2. vols. Madr. 1649-1656).

AVILE'S (Anc. *Flavignavia*), a t. of Asturias, Spain, in the province of Oviedo, and 19 m. n. by w. from Oviedo, at the mouth of the chief branch of the Aviles, which is here crossed by a bridge, and is navigable at high water for vessels of the largest size up to the town. It has several good squares, but the streets are irregular and arcaded. There are copper-mines in the vicinity, and a considerable trade is carried on in copper vessels manufactured from their produce, as well as in coal, which is obtained not far from the town. Manufactures of earthenware, glass, linen, etc., are also carried on. A. is one of the cradles of the Spanish monarchy, and contains a number of curious old buildings. The charter granted to the t. by Alonso VII. in 1135 is preserved among the public records. Pop. 7400.

AVITUS, ALCIMUS ECDICIUS, d. 525; a poet and bishop of Vienna, who was canonized as a saint because of his opposition to Arianism. He left a poem on the creation

and original sin, which has been thought to have some resemblance to Milton's *Paradise Lost.*

AV'IZ, an order of knighthood in Portugal, instituted by Sancho, the first king of Portugal, in imitation of the order of Calatrava, and having, like it, for its object the subjection of the Moors. By the present usage, the king of Portugal, who is grandmaster of all of them, wears decorations of the first three orders of Portugal—those of Christ, St. James, and Aviz united in one medal, divided into three equal spaces.

AVLO'NA, or VALONA; a seaport in Albania, the ancient *Audon,* in the pachalik of Janina, on the gulf of A.; pop. 6000. Trade is in the hands of the Christian portion of the people. The Turks manufacture arms and woolen goods.

AVO'CA or OVOCA (Celt. meeting of the waters), a small river in the s.e. of Wicklow co., formed by the union of two streams, rising in the hills of the center of the county. The A. runs through a very picturesque vale only a quarter of a mile broad, with wooded banks 300 to 500 ft. high, and after a course of 9 m., reaches the sea at Arklow. A. vale is celebrated in Moore's *Irish Melodies.*

AVOCA'DO PEAR, or ALLIGATOR PEAR (*Persèa gratissima*), a fruit tree of the natural order *Lauraceæ* (q.v.), a native of the warm regions of America. It attains the height of 30 to 70 ft., and is a slender tree with a dome-like top. The leaves resemble those of the laurel. The flowers small, and are produced towards the extremities of the branches. The fruit is a drupe, but in size and shape resembles a large pear; is usually of a brown color, and has a soft green or yellowish pulp, not very sweet, but of a delicate flavor, which dissolves like butter on the tongue, and is believed to consist principally of a fixed oil. It is called *vegetable butter* in some of the French colonies. It is much esteemed in the West Indies, and often eaten with sugar and lime-juice or wine, or with spices.

AVOCET', or AVOSET (*Recurvirostra*), a genus of birds, which, although having the feet webbed nearly to the end of the toes, is usually ranked among the *Grallæ* or *Grallatores,* upon account of the length of the legs, the half-naked thighs, the long, slender, elastic bill, and the general agreement in habits with snipes. They are distinguished from all other birds, except a few species of humming-bird, by the strong upward curvature of the bill, which is much like a thin piece of elastic whalebone, and most probably a delicate organ of touch, adapted for seeking food in mud, as their webbed feet are for walking upon it, and their long legs for wading in the fens and marshes which they frequent. They are birds of powerful wing. They are not much addicted to swimming. They scoop through the mud with the bill, first to one side, and then to the other, in quest of worms and other small animals; although Audubon has also observed the American A. taking insects which were swimming on the surface of the water, and expertly catching them in the air, running after them with partially expanded wings.—The common A. (*R. avocetta*), the body of which is about as large as that of a lapwing, is sometimes, though very rarely, found in the fenny districts of England; it is also a native of the continents of Europe, Asia, and Africa, occurring even at the cape of Good Hope.—Other species are natives of North America, India, and New Holland.—The American A. (*R. Americana*) has the bill less recurved than the common A.

AVOGADRO'S LAW. See ATOMIC THEORY.

AVOIDANCE, in English ecclesiastical law, the term by which the vacancy of a benefice, or the fact of its being *void* of an incumbent, is signified. A. is opposed to *plenarty,* or fullness. See BENEFICE.

AVOIRDUPOIS, or AVERDUPOIS', is the name given to the system of weights and measures applied in Great Britain and Ireland to all goods except the precious metals and precious stones. The word is generally said to be derived from the French *avoir du pois,* to have weight; but the middle-age Latin word *averia* or *avera,* used for goods in general, or the middle-age Latin *averare,* and French *avérer,* meaning to *verify,* seem to offer more probable etymologies.

The grain is the foundation of the Avoirdupois system, as well as of the Troy. A cubic inch of water weighs 252·458 grains. Of the grains so determined, 7000 make a pound A., and 5760 a pound Troy. See WEIGHTS AND MEASURES.—The A. pound is divided into 16 ounces, and the ounce into 16 drams. A dram, therefore, contains $27\frac{11}{32}$ grains, and an ounce $437\frac{1}{2}$ grains.

TABLE OF AVOIRDUPOIS WEIGHT.

$27\frac{11}{32}$ grains	are	1 dram,	1 dr.
16 drams or drachms	"	1 ounce,	1 oz.
16 ounces	"	1 pound,	1 lb.
28 pounds	"	1 quarter,	1 qr.
4 quarters	"	1 hundredweight,	1 cwt.
20 hundredweight	"	1 ton,	1 ton.

A cubic ft. of water weighs 997·14 oz. A., or nearly 1000 oz., which gives an easy rule for determining the weight of a cubic ft. of any substance from its specific gravity. A. is the weight used in the United States of North America, where, however, in many places, the cwt. contains only 100 lbs., and the ton, 2000 lbs.

AVO'LA, a t. in Sicily, 13 m. s.w. of Syracuse; pop. 11,912. A. was ruined by an earthquake in 1693, but was soon rebuilt. It has a fishery and a sugar refinery; and the neighborhood is still famous for honey, the "honey of Hybla" so much praised by ancient writers.

A'VON, a word of British or Celtic origin, meaning "river" or "stream;" which seems allied to Aa (q.v.), the name of so many continental rivers. It is the name of several of the smaller British rivers. Of these may be noticed: 1. The Upper or Warwickshire A., which rises in northwest Northamptonshire, runs s.w. through Warwickshire and Worcestershire, passing Rugby, Warwick, Stratford, and Evesham, and joining the Severn at Tewkesbury. It has a course of 100 m., and receives several tributaries. 2. The lower, or Bristol, or west A., which rises in northwest Wiltshire, and runs 70 or 80 m. first s. in Wiltshire, and then w. and n.w. between Gloucestershire and Somersetshire. It traverses an oolitic basin, passing Bradford, Bath and Bristol, and empties itself into the British channel. It is navigable for large vessels up to Bristol. It runs generally between deep banks in a rich valley. A canal through the middle of Wiltshire connects it with the Thames. 3. The Wiltshire and Hampshire, or east A., which rises in the middle of Wiltshire, and runs s. 70 m. through Wiltshire and Hampshire, passing Amesbury, Salisbury, and Ringwood, and entering the English channel at Christ church. It is navigable up to Salisbury. It abounds in the small delicate loach. In Wales two rivers named A.—one rising in Monmouthshire, the other in Glamorganshire—fall into Swansea Bay. In Scotland there are several of the same name, affluents of the Spey, Annan, Clyde, and Forth.

A'VON SPRINGS, a resort for invalids, its mineral waters being valuable in cutaneous diseases and rheumatism. Avon is a village in New York, 19 m. s.s.w. of Rochester, beautifully situated on a small plateau near the Genesee river.

AVOYELLES, a parish in Louisiana, on the Red river; 800 sq.m.; pop. '70, 12,926—6175 colored. It is chiefly level and low, and subject to overflows from the river. Corn, rice, cotton, and sugar are the leading products. Chief town, Marksville.

AVRANCHES (anc. *Abrancæ*), a city of the dep. of Manche, France, near the left bank of the Seez, 33 m. s.s.w. from St. Lo. It stands on the sides and summit of a high hill, which extends in a long ridge, and the ascent of which is by zigzag roads on terraces. This hill commands a very wide and beautiful view of a finely wooded and cultivated district, with a winding river, which expands into a broad estuary, at the mouth of which is the high islet peak of Mt. St. Michel. A. was formerly a bishop's see, and its cathedral was one of the most magnificent in Normandy, but was pulled down in 1799 to prevent it from falling. A stone still preserved on the site of the cathedral is said to be that on which Henry II. of England kneeled before the papal legates to receive absolution for the murder of Becket. Before the Roman conquest of Gaul, A. was the capital of the Abrincatui. It was a place of importance during the Roman period. Charlemagne fortified it, but it was taken by the Normans in 865. It was afterwards a frequent object and scene of strife during the wars between the French and English. It has manufactures of lace, tiles, and bricks, and a little trade in grain, butter, cattle, etc. Pop. '76, 7754.

AWÁJI, an island in the inland sea of Japan, between Shikoku and the mainland, celebrated for its crackle and yellow glazed pottery. In Japanese mythology, it was the first created of all the islands.

AWARD, the decision of arbitrators or referees, or the document containing their judgment. An A. must be consonant with and follow the submission, and affec only the parties; it must be final, certain, specific, without palpable or apparent mistake, and must be possible to be performed. The effect of an A. is a final judgment between the parties in all matters submitted. It transfers property as much as does the verdict of a jury, and will estop the statute of limitations. An A. may be enforced by an action at law or under a rule of court. Courts have no power to alter or amend an A., but may recommit to the referee in cases of uncertainty, mistake, etc.

AWÁTA, a village in the suburbs of Kioto, Japan, famous for its yellow faience. A. pottery was invented in the 17th c., is decorated, and by the Japanese is called Tamago Yaki (egg-ware). It is largely exported to the United States.

AWE, LOCH, a lake in the center of Argyleshire, extending in a direction n.e. and s.w. about 24 m., with an average breadth of from half a m. to 2½ miles. It rarely freezes, and its surface is 108 ft. above the sea. The country around consists of mica slate. The scenery is most striking at the n.e. end of the lake, where the water is studded with numerous wooded islets, overshadowed by towering and rugged mountains, prominent among which rises the dark and rocky ridge of Ben Cruachan, 3669 ft. high and 14 m. in circuit. Of the islands, the most noted is Fraocheilean, containing the remains of a castle granted to Gilbert M'Naughton in 1267 by Alexander III. On a peninsula, in the n. end of the lake, stands Kilchurn casle (Caesteal Chaoil-chuirn), once a fortress of great strength, built about 1440 by Sir Colin Campbell of Glenorchy, and garrisoned, as late as 1745, by the king's troops. The waters of the lake are carried off at its n.w. end by the river Awe, which, after a course of 7 m., enters the sea at Bunawe on loch Etive. The magnificent "Pass of Awe," through which the road runs beneath the shoulder

of Ben Cruachan, was the scene of a conflict, in 1308, between Robert the Bruce and the M'Dougalls of Lorn, in which that clan was all but exterminated. At the n.e. end of the loch, it receives the waters of the Orchy and Strae, flowing through glens of their own names. Loch A. contains fine fish, especially trout, *salmo ferox*, and salmon; and the small villages of Claddich and Port Sonachan, on the e. side of the loch, due n. of Inveraray, are the general resort of anglers.

A-WEATHER is a term denoting the position of the helm when jammed close to the weather-side of a ship; it is the reverse of *a-lee*.

A-WEIGH, as applied to the position of an anchor, when just loosened from the ground and hanging vertically in the water, is nearly equivalent to *a-trip*.

AWN (*Arista*), in the flowers of grasses, a solitary pointed bristle, growing either from a glume or a palea. The flowers of some grasses are entirely *awnless;* in many, the glumes alone are *awned* (or *aristate*), or only one of them; in others, the glumes are awnless, and the paleæ, or one palea, awned. The awn is often terminal, and appears as a prolongation of the midrib of the glume or palea; from which, however, it sometimes separates below the point, and is then said to be on the back of it, or *dorsal;* sometimes it is jointed at the base, and finally separates at the joint, sometimes it is knee-bent or geniculate; sometimes it is twisted, and liable to twist and untwist hygrometrically; sometimes it is rough, or even serrate, at the edges, as in barley; sometimes it is feathery, as in feather-grass (*stipa*), which also is remarkable for the great length of its awn. The characters of genera and species are often derived from it, but it is not always invariable, even in the same species, and the cultivated varieties of wheat and oats differ much in being more or less *bearded*. There appears to be a tendency to the diminution or disappearance of the awn through cultivation.

AWYAW, AGA-OJO, or OYO, a city in central Africa, the capital of Yoruba; est. pop. 70,000.

AX, or DAX (anc. *Aquæ Augustæ*), a noted watering place in France, at the foot of the Pyrenees, 2000 ft. above the sea, on the Odour river, 32 m. by rail n.e. of Bayonne. It is a village of about 2000 inhabitants. There are more than 50 springs varying in temperature from 100° to 200°. One of the springs is famous for curing leprosy.

AXAYCA'TL, Emperor of Mexico, the father of the second Montezuma. About 1467 he led his Aztecs to the conquest of Tehuantepec, and afterwards defeated a rebellion that threatened his capital, the city of Mexico. He died suddenly, about 1477. Half a century later the soldiers of Cortes occupied A.'s palace, and discovered an immense treasure of gold and silver in ore and bars, with jewels, and many curious articles of manufacture.

AXE, the name of two small rivers in the s.w. of England. One rises in the Mendip hills, n. of Somerset, runs first s.w. and then n.e., through a carboniferous limestone, trias, and diluvial basin, past Wells and Axbridge, into the Bristol channel. The other rises in west Dorset, and flows 21 m. s. and s.w., through east Devonshire, in an oolitic and trias basin, past Axminster into the English channel. A. is only another form of Exe. See AA.

AXE, one of the oldest tools used by man; formed in the early ages of stone, bronze, copper, and iron. At present an A. is mainly of wrought iron, with a cutting edge of fine steel. The butt or main part, is made of good rolled iron, cut into suitable lengths, hollowed at the middle so that when the ends are brought together the hollow will form the eye for the handle. Between the ends is welded in a cutting piece of steel, projecting an inch or more beyond the iron, and thinned down nearly to an edge. Having been properly tempered and ground, and fitted with a wooden helve, the axe is ready for use. Forms and weights vary according to the use to which the tool is to be put. For very hard timber the cutting edge is narrow, and the whole instrument heavy; for carpenter work on soft timber, the edge is of 8 to 12 in., as in the broad-axe. Common forest axes weigh from 3 to 7 lbs. Besides these forms, there are the adze, a tool used for chipping, or rough planing by carpenters, and the pickaxe (which is not an axe in any sense) for digging in hard ground. American axes have a high reputation in Europe, and have to some extent supplanted the English article in the markets of that country.

AX'EL, or **AB'SALON**, Archbishop of Lund, in Denmark, and also minister and general of king Waldemar I., was b. in 1128, and d. 1201. He was descended of a distinguished family, and, in his youth, studied at Paris. A. distinguished himself as well by wisdom and uprightness in peace, as by valor and address in war. The Wendish pirates were not only driven from the coasts of Denmark, but attacked in their own settlements, and subdued. He defeated the Pomeranian prince, Bogislav, and made him dependent on Denmark. In the wise legislation of Waldemar and of his son, he took a great part. He favored and promoted learning and art, and to his encouragement we owe the first connected history of Denmark by Saxo Grammaticus. By building a fortified castle for defense against the pirates, he laid the foundation of the future great city of Copenhagen, which was then an insignificant village, inhabited only by fishermen. Owing to this origin, Copenhagen has sometimes got the name of Axelstadt. A. lies buried in the

church of Soroe, where he had founded a monastery. The relics found when his grave was opened in 1827, the chief of which were a bishop's staff and ring, are described in the latest complete biography of A. by Estrup, translated into German by Mohnike in Illgen's *Zeitschrift für Historische Theologie* (2 vols. Leip. 1832).

AXESTONE, a mineral generally regarded as a variety of nephrite (q.v.). It is of a greenish color, is more or less translucent, hard, tough, and not easily broken. It occurs in primitive rocks, always massive, and is found in Saxony, in Greenland, and in New Zealand and other islands of the southern Pacific. It derives its name from the use to which it is put by the natives of these islands for making their hatchets. They also make ear-drops of it.

AX'HOLME ISLE (A. Sax. *holme*, a river-isle), a low level tract in the n. of Nottinghamshire, surrounded by rivers—the Trent on the e.; Don, n. and w.; Torne and Idle, on the w.; and Vicardyke, between the Trent and Idle on the south. This district, 18 m, from n. to s., and five on an average e. and w., was anciently a forest, but afterwards became a marsh. The marsh was drained into the Trent in 1634 by Vermuyden, a Dutchman, after five years' labor, and at the cost of £56,000. The reclaimed land became very fertile under Dutch and French Protestant settlers, and after much litigation, it was, in 1691, divided, the original inhabitants receiving 10,532 acres, and the settlers 2868. On the land are raised abundant crops of wheat, oats, rye, pease, beans, clover, flax, rape, hemp, potatoes, and onions. Peat and turf fuel abound, and valuable gypsum beds occur. The water is brackish, too hard for washing, and curdles milk when boiled with it. A. I. includes seven parishes. There are two small towns, Crowle and Epworth.

AX'IL, *Axilla*, in botany, the angle between the upper side of a leaf and the stem or branch from which it grows. Buds usually grow in the axils of leaves, although they are not always actually developed; but a bud may be made to appear in such a situation, and to form a new shoot or branch, by artificial means, which direct the strength of the plant more particularly to that quarter, as cutting over the main stem, wounding it above the place where the new branch is desired, etc. Flowers or flower-stalks (*peduncles*) growing from the axils of leaves are called *axillary*.

AXIM', a t. on the Guinea coast, Africa, 73 m. w. of Cape Coast Castle. In 1642, it was taken from the Portuguese by the Dutch, who, in 1872, ceded it with the whole of their possessions in Guinea to the English.

AX'INITE, a mineral containing oxide of iron, lime, alumina, and silica, occurring in flat, sharp crystals, edged like an axe.

AXINOMANCY (Gr. *axine*, an axe, and *manteia*, divination), a mode of divination much practiced by the ancient Greeks, particularly with the view of discovering the perpetrators of great crimes. An axe was poised upon a stake, and was supposed to move so as to indicate the guilty person; or the names of suspected persons being pronounced, the motion of the axe at a particular name was accepted as a sign of guilt. Another method of A. was by watching the movements of an agate placed upon a red-hot axe. This is only one of a multitude of analogous modes of divination practiced in all ages and among all nations. See DIVINATION, and DIVINING-ROD.

AXIOM, a Greek word meaning a *demand* or *assumption*, is commonly used to signify a general proposition, which the understanding recognizes as true, as soon as the import of the words conveying it is apprehended. Such a proposition is therefore known directly, and does not need to be deduced from any other. Of this kind, for example, are all propositions whose predicate is a property essential to our notion of the subject. Every rational science requires such fundamental propositions, from which all the truths composing it are derived; the whole of geometry, for instance, rests on, comparatively, a very few axioms. Whether there is, for the whole of human knowledge, any single, absolutely first A., from which all else that is known may be deduced, is a question that has given rise to much disputation; but the fact, that human knowledge may have various starting-points, answers it in the negative. Mathematicians use the word A. to denote those propositions which they must assume as known from some other source than deductive reasoning, and employ in proving all the other truths of the science. The rigor of method requires that no more be assumed than are absolutely necessary. Every self-evident proposition, therefore, is not an A. in this sense, though, of course, it is desirable that every A. be self-evident; thus, Euclid rests the whole of geometry on 15 assumptions, but he proves propositions that are at least as self-evident as some that he takes for granted. That "any two sides of a triangle are greater than the third," is as self-evident as that "all right angles are equal to one another," and much more so than his assumption about parallels, which, it has been remarked, is neither self-evident nor even easily made evident. See PARALLELS. Euclid's assumptions are divided into 3 "postulates" or demands, and 12 "common notions"—the term A. is of later introduction. The distinction between axioms and postulates is usually stated in this way: an A. is "a theorem granted without demonstration;" a postulate is "a problem granted without construction"—as, to draw a straight line between two given points.

AXIS, in geometry.—The A. of a curved line is formed by a right line dividing the curve into two symmetrical parts, so that the part on one side exactly corresponds with that on the other; as in the parabola, the ellipse, and the hyperbola. The A. of any geometrical solid is the right line which passes through the center of all the corresponding parallel sections of it; in this sense, we speak of the A. of a cylinder, a globe, or a spheroid. By the A. of rotation, we understand the right line around which a body revolves.—In physical science, the A. of a *lens* is the right line passing through it in such a manner as to be perpendicular to both sides of it; and the A. of a telescope is a right line which passes through the centers of all the glasses in the tube. The A. of the *eye* is the right line passing through the centres of the pupil and the crystalline lens.

AXIS, in botany, a term applied to the central part both above and below ground, around which the whole plant is regarded as arranged. The stem is called the *ascending A.;* the root, the *descending axis.* The opposite tendencies of growth appear as soon as a seed begins to germinate, in the radicle and plumule; the former of which is the descending A., and the latter the ascending A.; the former descending deeper into the soil, the latter ascending towards the air and light. That part of the stem around which the flowers are arranged is called the *floral A.*, and, in describing some kinds of inflorescence, the terms *primary floral A.*, *secondary floral A.*, etc., are occasionally employed.

AXIS, *Cervus axis*, a species of deer, abundant on the banks of the Ganges, but found throughout India and in many islands of the eastern Archipelago. It was known to the ancients by the name axis. One of its Indian names is chittra, and by British sportsmen in India it is generally called the spotted hog-deer. By some naturalists, it has been made the type of a genus of *cervidæ*, called *axis.* The A. has a great resemblance in size and coloring to the European fallow-deer; it is generally of a rich fawn color, beautifully spotted with white, nearly black along the back, the under parts snow-white. The horns, however, differ very much from those of the fallow-deer, being slender, sharp-pointed, little branched, and not at all palmated. The female has no horns. The A. frequents thick jungles in the vicinity of water, and feeds during the night. It is commonly found in herds of 15 or 20, of which 3 or 4 are males. Its sense of smell is remarkably acute, and it is generally very shy and timid, so that sportsmen find it difficult to get within shot. The males, however, sometimes exhibit great courage in defense of the young. It is very easily domesticated, is very gentle in its manners, has been frequently imported into Europe, and breeds freely in the parks in which it is kept at a few noblemen's and gentlemen's seats in Britain and France.

AXLE, the bar of metal or wood, connecting the wheels and supporting the body of a wheeled vehicle. In railway carriages the A. is fastened to and revolves with the wheels.

AX'MINSTER, a small t. in e. Devonshire, on the side of a little hill on the left bank of the Axe. Pop. in '71, 2861. A. was once famous for the manufacture of Turkey and Persian carpets, which were little inferior to those imported. Two celebrated geologists have been connected with A.: Dr. Buckland was born here, and Dr. Conybeare was lord of the manor, and vicar.

AX'MOUTH, a village at the mouth of the Axe, e. Devonshire. A mile e. of A. occurred, in 1839, a landslip; an area of 200 ft. wide, for three quarters of a mile parallel to the shore, having sunk 250 ft. below the sea, with a great noise. The chasm thus formed became a lagoon, while the neighboring sea-bed rose 40 feet. Rather more than a mile further e., occurred another but smaller landslip in 1840. The district around consists of greensand strata.

AXOLOTL, pronounced *acho'latl* (*gyrinus*, or *axolotes edulis*), a remarkable animal, found in great abundance in some of the Mexican lakes, and particularly in the lake of Mexico itself. It is a batrachian (q.v.) reptile of the family of the *proteidæ* or *perennibranchiate batrachians*, in which the gills remain during life, and the lungs are never sufficiently developed to maintain respiration by themselves. It is in general form very like a fish; has a large and broad head; and tapers into a long compressed tail, which has a thin membranous fin both on its upper and its lower side. It has four legs, with toes not webbed; and on each side of the neck the gills form three long branched or feathered processes, which give it a very remarkable appearance. It is brown, and mottled with small black spots. When full grown, it averages 8 or 9 in. in length, though sometimes measuring 16 inches. It is esteemed a great delicacy in Mexico, and is there constantly brought to the market.

AXUM, once the capital of the Ethiopian kingdom of the same name, is situated in the modern Abyssinian province of Tigré, of which it is capital. Lat. 40° 7′ n.; long. 39° 27′ e. It now lies mainly in ruins, among which stands the principal church of Abyssinia, built in 1657. Pop. 2000. The former greatness of the city is testified by yet remaining structures cut in granite, some of which have inscriptions. From these it appears that the Axumite empire extended over Abyssinia, and even over Yemen and Saba in Arabia, and possessed the command of the Red sea. It acquired political importance from the circumstance, that it formed on the s. a boundary to the world-embracing power of Rome, as well as to that of Parthia, which then extended as far as Arabia. The Byzantine emperors even paid an annual tribute to the sovereigns of Axum. This

country was also the furthest point southward that Grecian civilization reached; through the medium of Egypt, Greek philosophy spread into A., and the Greek language became the language of the court and of the priests. Under king Aizanes, who, in a still remaining inscription, appears as a heathen, Christianity was introduced into the country from Egypt by the two apostles Frumentius and Ædesius, who were followed by many priests from the same quarter. The new doctrine soon spread over the whole country; Frumentius was made the first bishop of A., and Fremona was built in honor of him. The stone churches, many of them very imposing, yet scattered over the whole of Abyssinia, owe their architecture to Egyptian priests, and arose at that period, as well as the most celebrated Abyssinian convents and hermitages. The Axumite empire carried on, through Adule, an active commerce with Arabia and India; it formed the outermost bulwark of Christianity; and, as such, particularly from about the 6th c., it interfered in behalf of the Christians in Arabia, and became the natural enemy of Mohammedanism. The contests in which it soon became involved with that power caused its fall, as the kings gradually lost their possessions in Arabia, and the whole coast on the Red sea and gulf of Aden. The outlets for commerce were thus cut off, and the empire was at the same time so weakened by constant wars, that internal disorders brought on its complete dissolution.

AYACU'CHO, a department of s. Peru, on the e. side of the Andes, 24,213 sq.m.; pop. 147,909. It has a rough surface and variable climate; little is done in mining; cattle and honey-raising and agriculture are the principal employments. The battle of Dec. 9, 1824, fought in this department, secured the independence of the Spanish-South American colonies. The Spaniards, in largely superior force under Laserna, were effectively beaten and their leader captured by the colonists under gen. Sucre, the result being the capitulation of the Spaniards in Peru and the surrender of all their posts.

AYACU'CHO, a t. in a department of the same name in s. Peru. Here, on the 9th Dec., 1824, the combined forces of Peru and Colombia—the latter then comprising Ecuador, New Granada, and Venezuela—totally defeated the last Spanish army that was ever seen on the new continent.

AYA'LA, Pero Lopez de, called El Viejo, to distinguish him from his son of the same name, was b. at Murcia in 1332, of one of the first families of the Castilian nobility. He stood high in the regard of several kings of Castile, and filled the first offices of the state, latterly, that of high-chancellor and high-chamberlain of Castile. At the battle of Najera, in 1367, he was taken prisoner by the English, then in league with Peter the cruel, and confined for some time in an English dungeon; and again in 1385, by the Portuguese, at the battle of Aljubarota. He d. at Calahorra, in 1407. A. has acquired a name, not only as a statesman, but as a writer, especially as a historian and poet. His best known work is his *Crónicas de los Reyes de Castilla D. Pedro, D. Enrique II., D. Juan I., D. Enrique III.* (2 vols. Madr. 1779–80—the older editions of 1495 and 1591 are imperfect). He was the first among the Spaniards to give up the usual simple narrative of events in the order of time, and to seek to give a more rational representation of them according to the rules of historic art. It is only in recent times that the poetical works of A. have been discovered, the most remarkable of which is the *Libro o' Rimado de Palacio.* This "Book in Rhyme on Court-life," as its singular title may be translated, was begun during the poet's first captivity in England, and is composed in the old national form of rhyming Alexandrine stanzas of four lines; the contents are satirical and didactic. A. appears also in his poetical works as a representative of that transition epoch of Spanish national literature, when it was passing from a popular original literature to one of a more artificial imitative character.

AYAMON'TÉ, a t. of Andalusia, Spain, on the left bank of the Guadiana, and near its mouth, where it forms the boundary between Spain and Portugal. It stands on an acclivity. The upper part of the town consists of narrow and irregular streets; those of the lower part are regular and wide. There are three public squares. The principal occupation of the inhabitants is fishing. Boat-building and lace-making were once very extensively carried on, but both have greatly declined. Pop. 8000.

AYE-AYE, *Cheiromys Madagascariensis,* a quadruped about the size of a hare, a native of Madagascar, which was at first placed by naturalists among squirrels, and was ranked by Cuvier along with them in the order of rodents (*rodentia*), although Sonnerat, who discovered it, pointed out its affinity also to the makis or lemurs, to which family it is now pretty generally referred. The principal reason for placing the A. among the *Rodents,* has been found in the conformation of its teeth; but the other characters of the animal agree generally with those of the lemurs, and its habits resemble theirs. The A. has large, broad ears, large round eyes, long brownish gray hair, and a large bushy tail, which it does not carry over its back as squirrels do. It is very active during the night, but sleeps during the day. In confinement, it will subsist on boiled rice and fruits. It seems to be able to make as good use of its front teeth for gnawing as any of the rodents (gnawers). Mr. Ellis mentions one which ate its way through a barrel, and made its escape. He thinks it probable that there are more species than one.

AYESHAH, the favorite wife of Mohammed, was b. at Medina in 610 or 611 A.D. She was only nine years of age when she married the prophet. Her father's name was

Abdullah, but he was surnamed Abu-Bekr, "father of the virgin," in consequence, it is said, of his daughter being the only one of Mohammed's wives who was a virgin. Although A. bore no children to Mohammed, she was so tenderly beloved by him, that he was wont to say that she would be the first of his wives to whom the gates of Paradise would be opened. It is stated by Mohammedan historians, that to the charms of her beauty she added a knowledge of mathematics, rhetoric, and music. But this statement is improbable. She was accused of adultery, but Mohammed having produced a revelation from heaven to the effect that she was innocent, punished her accusers, and made it an article of faith for all time, that whoever should not believe in her purity should endure the pains of hell forever. In his last illness, Mohammed, by his request, was carried to her house, and expired in her arms. After the prophet's death, A. took an active part in the plot which deprived kalif Othman of his power and life, and headed a force to resist the accession of Ali. After some partial success, however, the troops under her were effectually defeated by Ali, and she was taken prisoner. Ali spared her life, and allowed her to reside in any town in Arabia she chose, provided she did not interfere with state affairs. She d. at Medina (677 A.D.). In spite of her political adversities, A. was highly venerated by all true Mussulmans, and named the *prophetess*, and the *mother of believers*. She was consulted on divers points of the Koran, and her interpretations were held to be binding. They have been collected in the *Sunna* (q.v.).

AYLES'BURY, a t. in the center of Buckinghamshire, on a rivulet which flows into the Thame, an east branch of the Thames. The pop. of the electoral district in 1871 was 28,760; that of the town proper about 6000. A., with its hundreds, returns two members to parliament. It is chiefly an agricultural town. Many fat ducks are reared in the neighborhood to supply the London markets at an early period of the season, when they fetch very high prices. A. is a very ancient town, having been taken from the Britons by the Saxons in 571.

AYLES'FORD, a village near the center of Kent, on the right bank of the Medway, 3½ m. n.e. of Maidstone. Remarkable ancient remains occur here. On a hill-slope 1½ m. to the n.e., there still stands a celebrated ancient dolmen, or burying-place, called Kits Coity House—a small truncated pyramidal chamber, open in front, and formed of four large rude Kentish rag blocks, three of which are uprights, with a slight slope inwards, and the fourth laid on them. Of the side-stones, one is 7 by 7½ ft., 2 ft. thick, and 8½ tons in weight; the second is 8 by 8½ ft., weighing 8 tons; and the third is smaller and more irregular in form. The capstone is 12 by 9½ ft., 2½ ft. thick, and weighs 10½ tons. This dolmen seems to have been the center of a group of ancient monuments connected by a long stone avenue with another group, 7 m. to the s.e. In this district also occur, on the brow of the chalk-hills on both sides of the Medway, large circular sepulchral pits, opening at bottom into one or more chambers. Some of these pits are covered with flat stones, and filled with flints. At A. the Britons defeated the Saxons in 455, and drove them from the island; but early in the 7th c. the Saxons were victorious here.

AYLMER, a village in Ottawa co., province of Quebec, Canada, on lake Deschênes, at the foot of steam navigation for the upper Ottawa. Pop. about 1700.

AYLMER, a lake about 50 by 30 m., in British America, 80 m. n. of Great Slave lake.

AYLMER, or ELMER, JOHN, 1521–94; an English theologian, a graduate of Oxford and tutor to lady Jane Grey. Mary's accession compelled him to abandon the country, and he went to Switzerland, where he wrote a reply to John Knox's argument against female sovereigns, in which A. highly flattered Elizabeth. He returned after E.'s accession, and was made archdeacon of Lincoln, and one of the synod that settled the doctrines and discipline of the church. As bishop of London, 1576, he went so far in retaliating for Roman Catholic intolerance as to be rebuked by the privy council.

AYLOFFE, Sir JOSEPH, an English antiquary of celebrity, b. about 1708 in the parish of Framfield, Sussex. In 1731 he was elected a fellow of the royal society, and in the following year, a fellow of the society of antiquaries. He was one of the first council of this society, after it received its charter of incorporation in 1751; and he was made vice-president some years after. When the new state-paper office was established in 1763, he was made one of the commissioners for the preservation of the state papers. In 1772, he published a valuable work on the national records. He also wrote several useful papers for the publications of the society of antiquaries; and projected, and was engaged in the execution of the work, afterwards continued by Gough, and known as Gough's *Sepulchral Monuments*, at the time of his death in 1781.

AYMAR, JAQUES, a celebrated French professor of the art of divination. A. was the son of a peasant of Dauphiné, and was b. at St. Veran in Sept., 1662. He was brought up as a mason, but he forsook that trade for the divining-rod, which he used at first to point out springs, hidden treasures, etc. In 1692, a murder and robbery was committed at Lyon, and A. and his rod were called into requisition to detect the criminals. In some way or other, he succeeded in discovering one of the guilty parties. A.'s fame having been spread by this incident, he was called to Paris to exhibit his art before the prince de Condé; but, unfortunately for his reputation, his power of divina-

tion utterly failed him; and being forced to confess himself an impostor, he was sent back in disgrace to his original obscurity.

AYMARAS, the name of an aboriginal people of South America, now chiefly in Bolivia, numbering about 200,000. They claim a very ancient origin from a people who came from the north and made the head of their government on the sacred island in lake Titicaca, and they also claim that they furnished the Quichian or Inca people with their religious ceremonies and knowledge of arts. It appears that the A. tilled the earth, built large and even splendid edifices, were familiar with painting and sculpture, and probably knew something of astronomy. They venerated the dead, putting them in a sitting position in large stone tombs that would hold a dozen, ranged so as to face each other, their feet meeting in the center of a circle. Some tombs were of brick; some of several stories with a body in each story; and all had openings facing the east, as the A. were sun worshipers. The present sun they called the fifth of a series, all of which had risen from the sacred lake. The Peruvian Incas gradually subdued the A. and took possession of their country. The existing A. are Roman Catholics. They are of ordinary Indian complexion, but of intelligent though melancholy expression. Agriculture is their chief reliance.

AYMON, the surname of four brothers, called respectively Alard, Richard, Guiscard, and Renaud, sons of Aymon or Haimon, count of Dordogne, who figure among the most illustrious heroes of the chivalric poetry of the middle ages; but their historic existence must be considered problematical, as the deeds attributed to them possess in so large a measure a miraculous character. What basis of fact may underlie the fanciful accretions of mythology, it is now impossible to determine. Their career belongs to the cycle of marvels, of which Charlemagne is the central point, and their adventures furnished rich material to the romantic narratives of Italy in the 15th and 16th c., and, in fact, were the exclusive subject of some of these. A novel, entitled *Les Quatre Fils Aymon*, by Huon de Villeneuve, a French poet of the age of Philippe Auguste, details very minutely their exploits. Finally, Ariosto conferred a poetical immortality on the family by the publication of his *Roland*, in which Renaud, the bravest of the four brothers, plays continually the most distinguished part. The traditions concerning them are not uniform or consistent. Some have a Provençal origin; but the author or authors of the popular German book which Tieck has edited and published, entitled *The Beautiful and Entertaining History of the Four Brothers Aymon, and of their Horse Bayard, with the Deeds and Heroic Feats that they Accomplished against the Pagans, in the Time of Charlemagne*, seem to have drawn from a different source. The most probable hypothesis, therefore, is, that the varieties in these poetic legends are due to the fancy and national predilections of the particular authors, and that there originally existed a single tradition, out of which the whole sprang.

AYO'RA, a t. of Spain, in the province of Valencia, and 50 m. s.w. from Valencia, on the upper part of a river of the same name, and situated in an extensive hollow at the base of a limestone mountain. It has four squares and wide streets. On the summit of the hill are the remains of an old castle, close to which the town once stood. The inhabitants are chiefly employed in husbandry and oil-making. Pop. 5412.

AYR, the co. t. of Ayrshire, is situated on the left bank of the river Ayr, about the middle of the coast of Ayrshire, 40 m. s.s.w. of Glasgow by rail. It lies in a coal district. A. is a clean and handsome town, and its principal streets are well built. To the south, between the town and the race-course, numerous elegant villas have recently sprung up. The spire of the assembly-rooms is 217 ft., and the Wallace tower, 113 ft. high. Three bridges span the river and connect the town with Newton-upon-Ayr—the "auld brig" and the "new brig" (taken down in 1877, and rebuilt) of Burns, together with a railway bridge. Part of the tower of the old church of St. John, built in the 12th c., and turned into a fort by Cromwell, is still standing. A. harbor is formed by the estuary of the river, and is protected by piers and a breakwater. A large wet dock has recently been built. The coasting trade is considerable. The chief export is coal, 180,000 to 200,000 tons yearly being exported from the Ayr collieries. A considerable quantity of grain and timber is imported. At one time, much wine was imported from France. At an early date, A. was a commercial and military place of some importance. William the lion made it a royal burgh about 1202. During the Scottish wars of independence, it formed a regular center of military operations, and, while in possession of an English garrison, it was the scene (according to *Blind Harry*) of Wallace's first exploits. The principal objects of interest near A. are connected with the memory of Robert Burns. See ALLOWAY KIRK. Pop. in 1871, municipal burgh, 7987; of the parliamentary burgh, including Newton-upon-Ayr, 17,954. A. unites with Campbelton, Irvine, Inverary, and Oban, in sending a member to parliament. Parliamentary constituency (1875–1876), 2426; annual value of real property, £65,150.

AY'RER, JACOB, next to Hans Sachs the most prolific and important German dramatic writer of the 16th century. His history is involved in obscurity; but it is known that he was a citizen of Nürnberg in 1594, and a procurator in the courts of law. It was not till after his death, in 1605, that a collection of his pieces was published, con-

sisting of 66 tragedies, comedies, and carnival plays (Nürnb. 1618). A. has the same garrulous breadth of dialogue as Hans Sachs, but is inferior to him in wit and humor.

AYRES, Romeyn B., b. N. Y., 1825; a graduate of West Point; served in the Mexican and civil wars; for good conduct in the Richmond campaign made brevet maj. gen. of the U. S. army and of volunteers.

AYR'SHIRE, an extensive maritime co. in the s.w. of Scotland, bounded, n., by Renfrewshire; w , by the firth of Clyde and the North channel; s., by Wigton and Kirkcudbright; e. and n.e., by Dumfries and Lanark. Its greatest length is 78 m.; its greatest breadth, 26—average 14½; area, 1149 sq.m., or 735,262 statute acres. It is the seventh in size of the Scottish counties. The general aspect of the county is undulating and hilly, the land attaining no great elevation, except a small portion in the n., and some considerable tracts in the s. and s.e., which are mountainous. None of the eminences exceed 2000 feet. A. contains a great number of lakes and small streams, the latter rising near the inland boundary of the county. The chief rivers—only 20 to 35 m. long—are the Ayr, with its tributary the Lugar, and the Doon, which flow across the center of the county; the Garnock and Irvine in the n.; and the Girvan and Stinchar in the south. A. to the s. of Girvan consists of lower Silurian rocks, and to the n. of that river, of patches of Devonian, carboniferous, and trap rocks. It is rich in valuable minerals, especially coal, ironstone, limestone, and freestone. The other minerals have been long wrought, but it is only of late years that the working of ironstone has been established—and is now carried on on a large scale in the n. of the county. On the banks of the Ayr is found an excellent species of whetstone, called water-of-Ayr stone. The climate of A. is mild and healthy, but moist. The soil along the coast is light and sandy, interspersed with deep loam; the most fertile districts are in the center of the county, where clay predominates. On the e. side are extensive mosses and moorlands. The three ancient divisions of the county are—Carrick, s. of the Doon, mostly wild and hilly; Kyle, between the Doon and the Irvine, containing much rich level land, but towards the coast the soil is light, and, though well cultivated, is less productive; and Cunningham, comprising all the country n. of the Irvine, mostly fertile. The characteristics of these districts are rudely indicated in the old country rhyme:

> Kyle for a man;
> Carrick for a coo;
> Cunningham for butter and cheese;
> And Galloway for woo.

Agriculture in A. till about 1800, was very backward; but since then, especially of late, extraordinary progress has been made in furrow-draining, improved rotation, and road-making; while the condition of the peasants has been much improved. In 1878, 314,191 acres were under crops and grass, held by 3569 persons, the farms being generally small. Dairy-husbandry is carried to high perfection in Ayrshire, the breed of milch cows, of which it rears a greater number than any other Scotch county, being noted as the finest in the kingdom for the quantity and quality of their milk. The Dunlop cheese, so called from the parish of that name, is almost as celebrated as Stilton, but is now almost superseded by that made on the Cheddar process. The breed of horses is also excellent. Manufactures, especially woolen and cotton, are carried on to an important extent. At Catrine there are extensive cotton-works; at Kilmarnock, dye-works, iron-foundries, etc.; and at Cumnock, a large pottery. Of the minor manufactures, the most characteristic is that of ornamental woodwork, often bearing tartan designs, which is extensively carried on at Mauchline. Great iron-works exist at Muirkirk, Hurlford, Kilwinning, Ardeer, Dalry, and Dalmellington. Maybole manutures shoes and agricultural implements. There are valuable fisheries on some parts of the coast. Troon, Ardrossan, Ayr, and Irvine are thriving ports. Pop. '71, 200,809; inhabited houses, 26,798; and the number of children, from five to thirteen, receiving education, 30,576. A. county returns two members to parliament. The chief towns, besides Ayr, are Kilmarnock, Girvan, Maybole, Dalry, Kilwinning, Beith, Irvine, Stewarton, Ardrossan, Saltcoats, Troon, Mauchline, Galston, Newmilns, Kilbirnie, and Largs. Of antiquities, the most interesting are the ruins of Crossraguel Abbey, near Kirkoswald, and of the castles of Turnberry, the family seat of Robert the Bruce, Dunure, Loch Doon, Dean, Auchinleck, Dundonald, etc.; also the ruins of Alloway Kirk.

A. was inhabited, in the time of Agricola, by the Damnii, with whom were afterwards mixed the Scots from the opposite coast of Kintyre. In the 8th c., the Northumbrian Saxons seized the territory; and afterwards came the Normans, whose traces still exist in local names. During the religious persecutions of the Stuarts, A. was a stronghold of the Covenanters.

AYSCUE, Sir George, 1616–76; an English naval commander. He was knighted by Charles I., and in the civil war took the side of the parliament, commanding in the waters around Ireland. In 1651, he reduced Barbadoes and Virginia to subjection, and the next year assisted Blake in the struggle with De Ruyter and Van Tromp. Four years later he had command of a squadron in the "four days" battle, in which the *Royal Prince*, his flag ship, stranded and was surrendered to the Dutch, who kept him a prisoner for many years.

AYTON, Sir ROBERT, a Scottish poet and favorite courtier in the reign of James VI. He was a younger son of Andrew Ayton of Kinaldie, Fifeshire, where he was born in 1570. He was enrolled as a student in St. Leonard's college, St. Andrews, in 1584, and took his degree of M.A. in 1588. For purposes of study, he next visited France, from whence he addressed, in 1603, an elegant panegyric, in Latin verse, to king James, on his accession to the throne of England. This poem appears to have been the making of A.'s fortune, for we find him afterwards appointed, successively, one of the gentlemen of the bedchamber, private secretary to the queen, and master of requests. Subsequently, he held the appointment of secretary to the queen of Charles I. King James employed him to convey copies of one of his works, conjectured to be his *Apology for the Oath of Allegiance*, to the German courts. A. was on terms of familiarity with all the most eminent men of his time—poets, wits, and philosophers alike—among others, Hobbes and Ben Jonson. He was himself a poet of considerable merit; but, unfortunately, a large number of his effusions being complimentary verses to his friends, are characterized by conceit and extravagant flattery. He was one of the first Scotsmen who wrote in English with any degree of elegance and purity. His verses on general topics "are conceived in a refined and tender strain of fancy, that reminds us more of the fairy strains of Herrick than anything else." Burns had a great admiration of some of A.'s pieces, two or three of which he paraphrased. A. is also said to have written verses in Greek and French, as well as in English and Latin. Several of his Latin poems are preserved in the work called *Delicia Poëtarum Scotorum*, printed at Amsterdam in 1637. A. died in Whitehall palace, Mar., 1638.

AYTOUN, WILLIAM EDMONDSTOUNE, was a native of Edinburgh, having been b. there in 1813. He received his education at the metropolitan university, and was called to the Scottish bar in 1840. In 1845, he was appointed regius professor of rhetoric and belles-letters in the university of Edinburgh; and after the formation of the Derby administration, in 1852, he was promoted to the shrievalty of Orkney and Shetland. He married a daughter of prof. Wilson. During many years, prof. Aytoun devoted himself to literary work. The earliest work of his with which we are acquainted is entitled *The Life and Times of Richard I.*, published in 1840—a subject well treated, and singularly in consonance with his chivalrous and romance-loving nature. Despite his minstrel tendencies, he is a master of caricature and parody; and many of the most successful of the *Bon Gaultier Ballads* are understood to be from his pen. In 1849, he published the *Lays of the Scottish Cavaliers and other Poems*, which established his reputation as a poet of the school of Sir Walter Scott, and which has run through many editions. Among his subsequent writings are—*Firmilian, a Spasmodic Tragedy*, published in 1854; and *Bothwell*, a narrative poem of considerable length, in the measure and manner of Sir Walter Scott, which was, after its first publication in 1856, to a large extent recast and improved. His edition of the *Scottish Ballads*, in 2 vols., appeared in 1858. In the ensuing year, he issued, in conjunction with his friend, Mr. Theodore Martin, translations of various minor poems of Goethe, in one volume. He was for many years one of the most frequent and brilliant contributors to *Blackwood's Magazine*. Prof. A. was successful in quite opposite departments of literature—he was distinguished at once as a poet and humorist. His poems exhibit a ballad-like simplicity, and a fiery flow of narration—the special merits of the poetical school in which he graduated; while his tales—the best known and appreciated of which are *The Glenmutchkin Railway*, and *How I became a Yeoman*—possess a certain robust humor and farcical abandonment, and are related to the writings of the great masters of humor much in the degree that the "screaming farce" is related to genteel comedy. His poetical powers appear in their greatest perfection in the *Lays of the Scottish Cavaliers;* the special merits of his humor are best exhibited in *How I became a Yeoman*. As a critic, he took up the knout of the dreaded Christopher North of the *Noctes*, which he wielded with considerable dexterity and force. Prof. A. died at Edinburgh, Aug. 4, 1865. His life has been written by Theodore Martin (Lond. 1867).

AYUNTAMIENTO is the name given in Spain to the councils or governing bodies of towns. Sprung from the institutions of the Romans, and firmly established during the long struggles with the Moors, the ayuntamientos acquired great influence and political power, the more so that the nobility were not excluded from them. Although this importance was impaired through the insurrection of Juan de Padilla in 1521; and at a later period, under the Bourbons, the last shadow of municipal freedom was lost; the remembrance of it continued to be cherished by the people. Accordingly, the cortes of Cadiz, in 1812, took up the leading features of the former system, adapting them, by more democratic modifications, to the requirements of the time. On the return of Ferdinand VII., the ayuntamientos were abolished; they were again restored by the cortes, in 1823; and after the invasion by France, once more set aside. During the civil war, various proposals were made regarding the ayuntamientos; but at last the arrangements of 1812 were confirmed by the constitution of 1837. According to that statute, the A., with the alcalde as president, is appointed by the free choice of the people, and is entitled to exercise the highest functions within the circle of its jurisdiction. The government can provisionally annul its acts, but must afterwards procure the ratification of the cortes, by which alone an A. can be dissolved. The ayuntamientos are empowered to

make up the lists of electors and jurors, to organize the national guards, to command the police within their own bounds, to direct the apportionment and raising of taxes, and to manage the funds of the commune. In 1840, a bill was brought into the cortes, formed on the model of the French law, proposing to deprive the ayuntamientos of all political power, and restrict their functions to purely municipal matters, and also to limit the franchise to the most highly taxed. But the insurrection which this step excited, and which ended in the expulsion of the queen, Maria Christina, prevented the project from being carried out. At last, in 1844, a law, similar to that proposed in 1840, was, through the intriguing of Christina, supported by French influence, adopted by the cortes, then composed of moderados; and this law, with little alteration, continues in force to the present day.

AZAD'IRINE, a bitter extract sometimes used in place of quinine. It is got from the bark of an East Indian tree known in America as the "Pride of China"

AZAIS; PIERRE HYACINTHE, 1766–1845; a French author and philosopher. He was a teacher in the college at Tarbes, but not liking the duties he became secretary to the bishop of Oleron; he soon gave up the place, and supported himself by playing the organ in a church. When the revolution of 1792 broke out, A. was one of its warmest advocates, but the horrors perpetrated made him a vehement opponent, and a pamphlet severely condemning the movement made immediate flight necessary. He returned to Paris in 1806, and in 1809 published his *Des Compensations dans les Destinées Humaines*, an optimist's view that good and evil are about fairly balanced, and that it is the duty of good citizens to submit to a fixed government. The idea naturally pleased Napoleon, who made A. professor at St. Cyr. At a later period he was in the public libraries at Avignon and Nancy. His Bonapartism kept him out of place for some years after the restoration, but he finally got a pension which placed him beyond the reach of want. According to A., all existence, whose cause is God, is the product of two factors, matter and force. Matter consists of primitive atoms. Force is expansive and subject to the law of equilibrium. All the phenomena of the universe are successive stages of the development of this one force acting on the primitive atoms; and this is traced in three orders of facts: 1, the physical; 2, the psychological; and, 3, the intellectual, moral, and political. In the physical, development can be traced from the simplest mechanical motion up through the more complex forces of light, heat, and electricity to the power of magnetic attraction, by means of which the second great order of facts is produced out of the first; for magnetic force acting on elastic bodies creates the primitive living globule, which is shaped like a tube open at both ends. From this first vital element a gradual ascent can be traced, culminating in man, who differs from other animals in the possession of intellect, or consciousness of the ideas which external things impress upon him. The immaterial in man, or his soul, is the expansive force inherent in him. Moral and political phenomena are the results of two primitive instincts, progressive and self-conservative, corresponding to the forces of expansion and represssion. From the reciprocal relations of these instincts may be deduced the necessary conditions of political and social life. The ultimate goal of life is the fulfillment of the law of equilibrium, the establishment of universal harmony. When that is accomplished, the destiny of man will have been achieved, and he will vanish from the earth, and that event may be looked for in 7000 years. For establishing complete universal equilibrium, 5000 years more will be requisite, at which period the present system of things will end.

AZA'LEA, a genus of plants belonging to the natural order *Ericeæ*, and distinguished from rhododendron (q.v.) chiefly by the flowers having five stamens instead of ten. Most of the species of A. also differ from the rhododendrons in having thin deciduous leaves. Some botanists unite the genus *A.* to *rhododendron*. One of the species best deserving of notice is *A. pontica*, a shrub from 3 to 5 ft. high, a native of the countries around the Black sea, with large obovate or oblongolanceolate shining leaves and umbellate yellow flowers, which are externally covered with glutinous hairy glands, and are very fragrant. It may be regarded as, like many of the other *ericeæ* (heaths, etc.), a *social* plant; and its golden flowers give great brilliancy to the landscape in many parts of the Crimea, the s.e. of Poland, the Caucasus, etc. It covers many mountain slopes, but does not ascend to great elevations, giving place to the more alpine *rhododendron ponticum*. It is common in gardens and shrubberies in Britain, and varies with orange, red, and almost white flowers. The whole plant is narcotic and poisonous, and the honey collected by bees from its flowers, which very much abound in honey, is said to cause stupefaction and delirium, as happened to Xenophon's soldiers in their famous retreat in Asia.—North America abounds in azaleas as well as in rhododendrons, and some of the species have been long cultivated in Britain, particularly *A. nudiflora* and *A. viscosa*, which, with *A. pontica*, have become the parents of many hybrids. Both have nearly white flowers, very beautiful, and of delicious fragrance. *A. viscosa* has the flowers covered with glutinous hairs like *A. pontica;* but the flowers of *A. nudiflora* are nearly destitute of them. Both species abound from Canada to the southern parts of the United States. They are taller shrubs than *A. pontica*. Upon account of its sweet smell, *A. nudiflora* is called in America the upright honeysuckle. *A. calendulacea*, a native of the southern parts of the United States, is described as frequently clothing the mountains with a robe of living scarlet.—India and China produce several

species of A., of which one of the finest is *A. Indica*, well known in Britain as a greenhouse shrub. Its flowers exhibit great brilliancy of colors. Many hybrids exist between the more hardy species and this. Another extremely beautiful species is *A. ledifolia*, an evergreen, which has been introduced into Britain from China.

A diminutive, procumbent, evergreen shrub, a native of alpine regions in Europe and North America, plentiful on high mountains in Scotland, was long known as *A. procumbens*, but is now called *Loiseleuria procumbens*. The flowers are small and rose-colored. The whole appearance of the plant widely differs from that of the genus of Azalea.

AZARA, Don Felix de, 1746–1811; a Spanish general; wounded in a fight with the pirates of Algiers in 1775. Six years afterwards he was one of the commissioners to settle the boundaries between the Spanish and Portuguese settlements in South America. He was there for twenty years, and developed a strong taste for natural history, publishing an important work on the *Quadrupeds of Paraguay* in Paris in 1801. His chief work, issued in 1809, is the story of the discovery and conquest of Paraguay and the river La Plata.

AZARI'AH, a frequent name among the Hebrews, signifying "helped by Jehovah." Eleazer has the same meaning. A number of A.'s are mentioned in the scripture, the most important being the prophet who met Asa on his return from a victory over the Cushites, and warned the king to suppress the worship of idols; 2, a son of Jehoida, who made special effort to restore the worship of the temple and put down Athaliah's usurpation; 3, a high priest who assisted Hezekiah in purifying the services of the temple; 4, called in Chaldaic "Abednego," one of the three cast into the fiery furnace.

AZAZEL, the word inscribed upon the lots cast by the high priest of the ancient Hebrews on the day of atonement, to determine which of the goats selected for a sin-offering should be the scape-goat, and which one should be sacrificed. Critics are unable to decide upon the meaning of the word.

AZE'GLIO, Mas'simo Marquis d', famous as an artist, a publicist, a romance-writer, and a statesman, was the descendant of an ancient and noble family of Piedmont. He was b. in 1798 at Turin, where his father held a high military position. In his fifteenth year, A. followed his father to Rome, where he had been appointed ambassador, and there contracted a love for the fine arts: but his study of music and painting was cut short by his father procuring him an appointment in a Piedmontese cavalry regiment. Here A. devoted his leisure with such intensity to scientific pursuits, that he brought on an illness which forced him to quit the service. A journey to Rome, from which he returned to Turin in 1820, restored his health, but deepened his passion for painting. After some difficulty, he got his father's permission to devote himself entirely to this art. A year had hardly elapsed ere A. had made himself a name in Rome as an artist. In landscape-painting he soon attained complete artistic skill. After a residence of eight years at Rome, during which he had pursued the study of history along with painting, he returned to Turin. On the death of his father in 1830, he went to Milan, where painting was then flourishing. In Milan he made the friendship of Alexander Manzoni, whose daughter he married. A. now began to make himself favorably known also in literature, his novels, *Ettore Fieramosco* (1833) and *Niccola di Lapi* (1841), having done much to fan the national spirit of the Italians. The political affairs of Italy soon occupied him exclusively; he traversed the provinces, cities, and villages, seeking to stir up the spirit of patriotism, and to conciliate the unhappy party divisions, and was everywhere received with rejoicing and acclamation. A. never belonged to a secret political society, but opposed conspiracies as mischievous, and exhorted the impatient to moderation. While in Florence, he wrote his famous piece, *Degli ultimi Casi di Romagna*, in which he lashed the miserable papal government, denounced the vain attempts at insurrection, and proved to the Italian princes the necessity of a national policy. After the election of Pius IX. as pope, A. returned to Rome, and to his influence were ascribed the reforms with which Pius began his government. He was intensely active at this time, and wrote much on public questions. (An edition of his political writings, collected in one volume, appeared at Turin 1851.) When Charles Albert, after the rising of Lombardy, crossed the Ticino, A. left Rome with the papal troops destined to support the Italian contest. In the battle of Vicenza, where he commanded a legion, he was severely wounded in the leg while fighting at the head of his troops. Scarcely was he recovered, when with his pen he courageously opposed the republican party, now intoxicated with victory. On the opening of the Sardinian parliament, he was chosen a member of the chamber of deputies. After the unfortunate event of the battle of Novara, the young king, Victor Emanuel II., appointed him (1849) president of the cabinet, an office which he undertook solely out of love to his king and country. His influence in this high position was most beneficial. At the close of the war in 1859, A. was appointed *pro tempore* general and commissioner extraordinary, purely military, for the Roman states. On his retirement, he issued a proclamation to the people, which greatly tended to strengthen their resolution by its noble yet temperate advice. He died on the 15th of Jan., 1866. Since his death, *Political Correspondence*, and other writings from his pen, have been given to the world; and his *Autobiography* has been published by his daughter.

AZERBIJAN', or ADERBAIJAN', the ancient *Media Atropatene*, is the most northerly province of Persia. It is situated between lat. 36° and 40° n., long. 44° and 48° 40′ e.; bounded on the s. by Persian Kurdistan and Irak, e. by Ghilan, n.e. and n. by the Russian territory, and w. by Turkish Kurdistan. It has an area of about 30,000 sq.m., and a pop. of 2,000,000. The surface of A. is very mountainous, many of the ranges rising from 7000 to 9000 ft. in height. The peak of Savalan (an extinct volcano) reaches an elevation of 13,000 ft. Mt. Ararat rises on the n.w. border. The chief rivers of A. are Aras or *Araxes*, the Kara Su, and the Kizil-Uzen. The salt lake Urumiyah or Urumieyeh (q.v.), the largest in Persia, is situated on the western border of the province. The climate of A. is not unhealthy, but it is subject to the extremes of heat and cold. The transition from cold to heat is very rapid. In the mountainous districts, the hail-storms are occasionally so violent as to kill cattle. The principal products of A. are rice, barley, wheat, maize, flax, hemp, cotton, tobacco, honey, and saffron; camels, horses, cattle, and sheep are also reared; velvet, silks, stuff, carpets, woolens, and leather are the most important articles of manufacture, and a little is done in hardware. Lead, iron, copper, sulphur, saltpetre, and salt are found in the province. The capital of A. is Tabriz, with a pop. of about 120,000. It has suffered greatly from earthquakes. The other towns of note are Urumiyah, on the lake of that name; Maragha, famous as the place where Nasir Eddin, the astronomer, fixed his observatory; Miana, Khoi, Selmas, and Ardebil.

AZEVE'DO COUTIN'HO, JOZÉ JOAQUIM (DA CUNHA), 1742–1821; the last inquisitor general of Portugal. He was bishop of Pernambuco in 1794, and became noted in 1798 for publishing in London an argument against the suppression of the slave trade. He was appointed inquisitor general in 1818. He is the author of a narrative of the conquest of Rio Janeiro in 1711 by Duguay-Trouin.

AZEVE'DO Y ZUNIGA, GASPARD DE, d. 1606; Count of Monterey and viceroy of Mexico and Peru. He fitted out an expedition under Pedro Fernandez de Quiro to search for the supposed great continent in the s. polar ocean. Some small islands were found, but not the continent.

AZIMABA'D, or TIROWLI, a t. of Sirhind, India, in 29° 48′ n. lat., and 77° e. long., on the route from Kurnal to Lodiana, 9 m. n.w. from Kurnal. Its site is slightly elevated above the neighboring plain, which is inundated in the rainy season. It is surrounded by a high brick wall, pierced with loopholes for musketry, and having bastions surmounted with a tower. A large caravansery is inclosed with a lofty embattled wall having a tower at each corner, and surrounded by a deep ditch, capable of being filled with water.

AZIMGHUR', or AZIM'S FORT, a name primarily applied to a t. in India, and thence extended to its district, forming one of the n.w. provinces. 1. The t. is in lat. 26° n., and long. 83° 14′ e. From Calcutta, it is 448 m. to the n.w.; from Benares, 81 to the n.; from Allahabad, 109 to the n.e.; and from Lucknow, 171 to the s.e. It is situated on the north-eastern Tons, a considerable offset of the Gogra, which is here crossed by a bridge of boats, and which is navigable downwards a distance of 40 m., to its confluence with the Surjoo. The t. contained, in '71, about 14,000 inhabitants, besides the troops in garrison. During the mutiny in 1857, A. was so far, a creditable exception to the general rule of ruthless cruelty among the insurgents. The sepoys did indeed mutiny, actuated, apparently, by a wish to appropriate a passing treasure of 7 lacs of rupees, or £70,000 sterling. But having formed a square round their officers, and sworn to protect them, they brought carriages for them and their families, and escorted the whole 10 m. towards Ghazeepore.—2. The district stretches in n. lat. between 25° 36′ and 26° 24′, and in e. long. between 82° 45′ and 84° 12′. Its area is stated to be 2550 sq.m.; and its pop., '71, to be 1,531,410. This gives the average of 600 persons to the sq.mile. This exceptionally high average is the more remarkable from the circumstance that there are few, if any, populous t. in the district besides the capital. The district is low and remarkably level. The soil is fertile, excepting that a few tracts are irreclaimably barren, from being impregnated with soda, nitre, and other saline substances. Magnificent crops of rice, sugar-cane, and indigo are produced. The principal manufactures are those of silk and cotton, the value of which amounts to more than £100,000 a year.

AZIMUTH. The A. of a heavenly body is the angle measured along the horizon between the n. or s. point, and the point where a circle, passing through the zenith and the body, cuts the horizon. The word comes from the Arabic, and is said to be derived from a word signifying a quarter of the heavens. It is usual to measure the A. westward from the point most remote from the elevated pole, beginning at 0°, and returning to it at 360°. Thus, in northern latitudes, where the n. pole is elevated, the A. is measured from the s. point, so that the e. point, for instance, has an A. of 270°. See ARMILLARY SPHERE. A. circles are those which extend from zenith to nadir, cutting the horizon at right angles, or those in which all the points have the same azimuth.

A'ZINCOURT, or AGINCOURT, a village in the department of Pas-de-Calais, France, celebrated for a bloody battle between the English and French, Oct. 25, 1415. The internal distractions of France under the imbecile Charles VI. (q.v.) had encouraged England to attempt to make good her ancient claim on France. Henry V. of England

had landed at Harfleur, had taken that fortress, and wished to march through Picardie to Calais, in order to get into winter-quarters. The dauphin advanced against him with a powerful force. A great number of the nobility accompanied him; and so great was their confidence, that the offered aid of the duke of Burgundy and of the city of Paris was rejected. Henry hastened to the Somme, but was followed by the French, who opposed his passage; he at last managed to cross with his army at St. Quentin. Greatly weakened in numbers, and suffering extremely from want of provisions, Henry offered to purchase peace by reparation of injuries. But the French would not hear of a treaty; as they entertained the hope of completely annihilating the English army. They had, in fact, intercepted the English march to Calais, by getting possession of the high road behind the little river Ternoise, near the villages of A. and Framecourt. The invading army, therefore, still (according to French accounts) 14,000 strong, of whom 2000 were men-at-arms—though no English writer makes it more than 10,000—prepared for an engagement by posting themselves between two woods, in a single line of battle, with the archers on the wings. The French, to the number of 50,000, under the command of the constable D'Albert, were drawn up in two lines, the men-at-arms, of whom only 2000 were mounted, being in the first. The English were the first to begin the onset. The French cavalry rushed forward to meet them, but were received with such a storm of arrows that they took to flight, threw themselves upon the first line and put it in disorder. On this, the light-armed English archers took to their billhooks and hatchets, broke into the ranks of the men-at-arms that fought on foot, whose heavy armor and close array rendered them almost incapable of resistance, and made the greatest havoc among them. This being followed by a charge of the English horsemen, the first line took to flight, the second was unable to arrest the victors, and the whole French army was soon completely dispersed. The victory was decided. For a moment, Henry believed that the rallying masses were going to renew the fight; and hearing also that a troop of armed peasants were plundering his baggage, he gave orders to slay all the prisoners taken. The order was already executed when he discovered the groundlessness of his alarm. As many as 10,000 Frenchmen were slain, among whom were the constable and six dukes and princes, the duke of Brabant, the count of Nevers, the duke of Alençon, the duke of Bar and his two brothers. Five princes, among them the dukes of Orleans and Bourbon, were taken prisoners. The English lost 1600 killed, including the duke of York, the king's great-uncle, whom the duke of Alençon slew. Alençon had even struck the crown from king Henry's head, when he was surrounded by all present, and fell with many wounds. Henry, however, was too weak to pursue his advantage, and therefore continued his march to Calais, where he embarked for England.

AZO, PROFESSOR, a distinguished professor of civil law in the university of Bologna, in the early part of the 13th century. A. was one of the most eminent of the glossists, or commentators, of his time, and Savigny calls his works the mort important of that school which have come down to us. The name is sometimes given to Azzo, or Azzolenus; also Azo Soldanus, from the surname of his father.

AZO'IC AGE, that period of geological time preceding the appearance of vegetable or animal life on earth. Constantly occurring discoveries render it impossible to fix a limit for the close of the age.

AZORES', a cluster of islands in the Atlantic, 800 m. due w of the southern half of Portugal, ranging in n. lat. between 36° 55′ and 39° 44′, and in w. long. between 25° 10′ and 31° 16′. In the first half of the 15 c., the A. were discovered by the Portuguese, or rather, it has been said, appropriated by them, after having been revealed to them by a Flemish navigator, Joshua Vanderberg, of Bruges. They were at that time uninhabited —a fact which, so far as it goes, seems adverse to any notion that America could have been colonized from Europe in this direction. That the A. were visited by the Carthagenians is proved by Phœnician coins found on Corvo. As early as 1436, they are marked on a map of the world by the Venetian Andrea Bianco. The Portuguese colonists called the whole group A., from *acor* or *azor*, a hawk; and they named the two individual islands Corvo and St. Jorgo, from Corvos Marinos and St. Jorsi, which, according to the maps of the 14th c., had been previously seen in the western ocean. In 1466, Alfonso V. made a life-grant of the island of Fayal to his aunt, the duchess of Burgundy, and from this circumstance many settlers migrated thither from Flanders. Without reckoning mere rocks, the islands are nine in number. Taken from e. to w., they are as follows: St. Mary, St. Michael, Terceira, Graciosa, St. Jorgo, Pico, Fayal, Flores, and Corvo. The area of the group is estimated at 980 sq.m.; while its pop. is '72, 260,072; yielding an average of 265 to a sq.mile. In the order of pop. and importance, the islands stand thus: St. Michael, Terceira, Pico, Fayal, St. Jorgo, Flores, Graciosa, St. Mary, and Corvo. Their capital is Angra, in Terceira; but Ponta Delgada and Ribeira Grande, both in St. Michael, are larger towns.

As may be presumed from the density of the population, the soil is fertile, and the climate healthy. The islands are also well watered. The exports are oranges, wine, brandy, grain, pulse, pork, beef, cheese, and coarse linens; and the imports are woolens, cottons, hardware, iron, glass, cordage, pitch, tar, staves, timber, oil, fish, rum, coffee, sugar, salt, and tea. Perhaps the greatest want of the group is a good harbor.

The A are of volcanic origin—a fact from which may probably be inferred their identity with the isles of Brazil or of Fire in the maps above mentioned, of the 14th century. Though most of the volcanoes themselves appear to be extinct, yet the islands contain hot springs, and are subject to violent earthquakes. The coasts are generally steep and rugged, while the interior parts abound in ravines and mountains. The mountains range from 1869 ft. to 7613—the latter being the height of the lava-covered *peak* which gives name to *Pico*.

AZOTE' (Gr. *a*, depriver of, and *zōē*, life) is the name given by French chemists to nitrogen (q.v.).

AZOTH, the panacea of Paracelsus, regarded by his followers as "the tincture of life."

AZ'OTIZED BODIES are those substances which contain azote or nitrogen as one of their constituents, and which form part of the living structure of a plant or animal, or are produced during its natural decay. The principal members of the group are *albumen*, present in white of eggs, and the juices of plants and animals; *globuline*, or *crystalline*, a variety of albumen found in the lens of the eye; *vitelline*, another variety of albumen, composing the greater bulk of the yolk of the egg; *paralbumen*, a third variety of albumen found in the animal system during certain diseases; *fibrine*, which occurs largely in the seeds of cereals and in animal muscle; *caseine* (or cheese matter), present in all milk; *legumine*, a variety of caseine found in pease, beans, and leguminous seeds in general; *gelatine*, which is present in the skin, bones, and other parts of animals; *chondrine*, a variety of gelatine obtainable from the cornea of the eye and the permanent cartilages; *isinglass*, another variety of gelatine manufactured from the inner membrane of the floating bladder of sturgeons and other fishes; *glue* and *size*, which are secondary forms of gelatine; *urea*, *uric acid*, and *hippuric acid*, which are present in the urine of the higher animals; *kreatine* and *kreatinine*, occurring in the juice of flesh; several forms of *urinary calculi*, which are found as stones in the bladder; and the very large and important class of *alkaloids*, including strychnine, morphine, quinine, etc. The principal members of the series of A. B. will be considered under their special headings; and the use of several of them as articles of diet will come into notice under FOOD.

AZO'TUS, the *Ashdod* of the Old Testament (now Esdud), a village on the Mediterranean, 21 m. s. of Jaffa. Lat. 31° 45′ n., long. 34° 37′ e. It was formerly one of the chief cities of the Philistines, strongly fortified, and the scene of numerous contests between that race and the Jews. Into this city the ark of the covenant was brought by the Philistines, and placed in the temple of their god Dagon, whose image fell in pieces before it. In the 8th c. B.C., the town fell into the hands of the Assyrians; and in the following century was captured by the Egyptians, after a 29 years' blockade and siege. In the wars between Alexander Balas and Demetrius, A. was destroyed by fire. It was afterwards rebuilt by the Romans, but never regained its early importance. It has now a pop. of about 300, and the sea is gradually receding from its harbor.

A'ZOV, or A'sow, a fortress and port t. in the s. of Russia, situated on the Don, about 20 m. from its mouth. The sand and mud deposited by the river have choked up the port, so that its trade and shipping have dwindled away, and the inhabitants now depend mostly on fishing. Pop. '67, 14,017. A. was anciently a Greek colony, under the name of Tanaïs, and carried on extensive commerce with the northern peoples. In number of inhabitants and in wealth it often rivaled Panticapæum (now Kertch). In the 13th c. it was taken possession of by the Genoese, who called it Tana. They were driven out of it by Timur (Tamerlane) in 1392. In 1471, it was taken by the Turks, and since then has borne the name of A., the Turks calling the town and the neighboring sea Asak. After an obstinate struggle, at which Peter the great, then beginning his career, was present, it was captured by the Russians about the end of the 17th century. It more than once fell again under the dominion of the Turks, but at last, in 1774, remained in the undisturbed possession of Russia. It was bombarded and destroyed by an allied English and French squadron in 1855.

A'ZOV, SEA OF, named after the town, is a large gulf of the Black sea, formed by the peninsula of Crimea, or rather an inland lake connected with the Black sea by the long narrow strait of Kaffa. The Siwash or Putrid sea is the western portion of the sea of A. cut off by the long narrow slip of low sandy land called the tongue of Arabat. The entrance to the Putrid sea is by the narrow strait of Genitschi at the n. of the Tongue. The Putrid sea is little but a succession of swamps. The ancient name of the sea of A. was Palus Mæotis. It gets the name of Balik-Denghis, or Fish-sea, from the Turks and Tartars, from its abundance of fish. The water is almost fresh. The whole sea is shallow, and occupies an area of about 14,000 sq. miles. During the Crimean war, an expedition, having on board 16,500 English, French, and Turks, was sent to this sea in May, 1855, which devastated the ports, and cut off supplies intended for Sebastopol.

AZPEI'TIA, a fortified t. in Spain on the Urola, 15 m. s.w. of San Sebastian; pop. 5300. During the Carlist movements in 1870–74, A. was the seat of the court for the management of the war; and the famous monastery of San Ignacio, dedicated to Loyola, was used for military purposes. The birthplace of Ignatius Loyola was near the town.

AZRAEL, in Jewish and Mohammedan belief, the angel who attends the dying, and separates the soul from the body.

AZTEC CHILDREN. In the year 1853, there were brought over to this country from America two diminutive children, a boy and a girl, said to be aged respectively 17 and 11, and who were represented as descendants of the ancient Aztecs. The height of each was under 3 feet. Their figure was slender and not ill proportioned; that which was chiefly remarkable being their features. While the forehead and chin receded, the nose was so singularly prominent as to suggest the idea of the face of a bird. Yet, with dark lively eyes, an olive complexion, and glossy long black hair, and a great fund of good-nature, they were far from unpleasing. They spoke no intelligible language, but understood a few words of English, and seemed to have a taste for music. Shown to the public as curiosities, they were usually exhibited on a large table, on which they ran about amusing themselves. Their exhibitor told a very incredible story of how they had been obtained from the ancient city of Iximaga, where they were reverenced as gods. A certain señor Velasquez, accompanied by a Canadian and an American, penetrated into this ancient city of Central America, where they made the acquaintance of one of the guardian priests of these undersized deities, who was so charmed with the accounts of the outer world, that he resolved to steal the gods of his people, and escape with the strangers. One after the other—the Canadian, the American, and the priest—were overtaken by disaster, and Velasquez alone was left to tell the wondrous tale, with no attestation but such as the children themselves furnished. Prof. Owen considered them mere dwarfs, and other authorities held a similar opinion. Belonging probably to some Indian tribe, they were doubtless monstrosities; and this becoming apparent, interest in them ceased.

AZTECS. The name of the dominant tribe in Mexico at the time of the arrival of the Spaniards. See MEXICO, ANTIQUITIES OF.

AZU'A, a t. of the island of San Domingo, not far from the s. coast, on the Bia, and near its mouth, 60 m. w. from St. Domingo. Pop. 6000.

AZUA'GA, a t. of Estremadura, Spain, in the province of Badajos, 20 m. e. from Llerena. It is situated in an elevated district, drained by the head-waters of the Matachel, a branch of the Guadiana; the surrounding country produces much grain, is partly covered with extensive oak forests, and contains large tracts of heath, bright in summer with the blossoms of different species of *cistus*. Pop. 6400.

AZU'NI, DOMENICO ALBERTO, a distinguished jurist, b. at Sassari, in the island of Sardinia, Aug. 3, 1749. He early applied himself to the study of law, devoting himself particularly to the maritime relationships of nations. He became judge of the tribunal of commerce at Nizza or Nice; and in 1795, after that city had been taken by the French, he published a work in which he endeavored to reduce maritime laws to fixed principles, and which, being recast, was published at Paris in 1805 under the title of *Droit Maritime de l'Europe*. The work was sufficiently anti-British in tone to secure its author the favorable consideration of Napoleon's ministry, by whom he was appointed one of the commissioners for compiling the new commercial code, the maritime portion being allotted to him. Genoa having been annexed to France, A., in 1807, was appointed president of the court of appeal there, where he remained until the fall of Napoleon. Among other things, A. published an *Essai sur l'Histoire Géographique Politique et Morale de la Sardaigne*, and a *Dictionary of Mercantile Jurisprudence*, and some controversial brochures. For some time after he had withdrawn from Genoa, he resided at Nice, and afterwards in his native island, where he was appointed, by king Charles Felix, judge of the consulate of Cagliari, and librarian to the university of that city. He died in Jan., 1827.

AZURE, a French word technically used in heraldry to signify blue. In engraving arms, it is always represented by horizontal lines.

AZ'URINE, *Leuciscus cæruleus*, a fish of the same genus with the roach, chub, etc., and most nearly resembling the red-eye (q.v.) or rudd (*L. erythrophthalmus*), from which, however, it is readily distinguished by the slate-blue color of the back, and the whiteness of the abdomen and fins. It is a fresh-water fish, and was first described by Yarrell from specimens received from Lancashire, where it is called the blue roach, but it is also an inhabitant of some of the lakes of Switzerland.

AZ'URITE, a name which has been given to the mineral more commonly called lazulite (q.v.), and to which, along with lapis lazuli (q.v.) or *azure-stone*, mineral turquoise (see TURQUOISE), etc., the generic name, *azure spar*, is sometimes given. The name A. is also given by mineralogists to an ore of copper, generally known as *blue copper* (see COPPER), nearly allied to malachite (q.v.), and remarkable for its beautiful azure color.

AZ'YMITES, the name given by the eastern to the western church, arising from a difference about the use, in the Lord's supper, of leavened or unleavened bread. The western, or Latin branch, insisted that unleavened bread might be used, and the Greek church stigmatized the Latins as "azymites," from the Greek *a*, "not," and *zume*, "leaven." The Latins retorted with "pro-zymites," but the terms, intended for reproach, soon passed, with the whole discussion, into history as useless additions to polemical nomenclature.

B

B THE second letter in the Hebrew or Phœnician alphabet, and in all alphabets derived from it, belongs to the order of labials, and is of the kind called medial or flat. See LETTERS, ALPHABET. Its name in Hebrew is *beth*, signifying "house." probably because its original hieroglyphic or picture form was an outline of a house or tent. In the corresponding words of sister-languages, we find *b* very generally replaced by some one of the other labial letters [*p*, *f* (*ph*), *v*]; these substitutions, however, take place not by chance or caprice, but according to ascertained laws. See PHILOLOGY, COMPARATIVE, and GRIMM'S LAW. The following are some examples of the interchange of *b* with other letters: Corresponding to Eng. *bear* are Sansc. *bhri*, Lat. *ferre*, Gr. *pherein:* Eng. *be*, Sansc. *bhu*, Lat. *fio* and *fui*, Gr. *phuo:* Eng. *bore*, Lat. *forare:* Eng. *of* and *off*, Gr. *apo*, Lat. *ab:* Eng. *wife*, plural *wives*, Ger. *weib*, Old H. Ger. *wip:* Eng. *web*, *weave*, *weft:* Gr. *episcopos*, Eng. *bishop*, Fr. *evêque*. In several Latin words, *b* arose out of *u* (pronounced like *v* or *w*). Thus, the original form of *bellum*, war, was *duellum* or *dvellum:* of *bonus*, *dvonus:* and the *d* being dropped (as we drop the sound of *k* in *knee*), the *v* became hardened into *b*. Similarly, *bis*, twice, is for *duis*. A remarkable interchange sometimes takes place between *b* and *m*, as in Sansc. *mri*, to die; Lat. *mort-*, death; and Gr. *brotos*, mortal.

The Greeks pronounced their *b* (*β*) like a *v*, for they spelled *Virgilius*, e.g., *Birgilios;* and this continues to be the case in modern Greek. In Latin, during the classical ages at least, the letter was pronounced as it is in English, French, etc. But in the time of the later emperors (beginning with the 3d c. of our era), *b* was softened down, in the popular language at least, to a slovenly sound like *v*; for in inscriptions of this period, such spellings as *verva* for *verba*, *miravili* for *mirabili*, are quite common. The distinction between the two sounds being once lost sight of, the letter *b* was frequently substituted for *v*—as *berba* for *verba*, *bivus* for *vivus*. This softening of *b* into *v* in the middle-age Latin, has left traces in the modern Italian and French; as Lat. *habere*, Ital. *avere*, Fr. *avoir;* Lat. *tabula*, Ital. *tavola*. A Spaniard, on the contrary, has a tendency to use *b* instead of *v*; thus he pronounces *vivere* like *bibere*, and *Jovis* as if written *Jobis*.

B, in music, is the seventh degree of the diatonic scale of C, and the twelfth degree of the diatonic-chromatic scale. In harmony, it is called the major seventh. According to the tempered system of tuning, the ratio of B, to the fundamental note C, is $\frac{8}{15}$. In the ancient diatonic scale, B was never used as a key-note, as its fifth, F, was imperfect. In the German notation, B is called H, while B flat is called simply B. B flat is half a tone lower that B, and in harmony is called the flat seventh. As a harmonic arising from C, B flat, as produced by nature, is considerably flatter than in the tempered system of tuning.

BAA'DER, FRANZ XAVER VON, 1765–1841; a German theologian. He was the third son of the court physician, and his elder brothers were distinguished, Clemens as an author, and Joseph as an engineer. Franz graduated at the university of Ingolstädt in 1782; assisted his father in medicine, but disliked the profession; studied engineering in the mining districts, and lived four years in England, where he became acquainted with rationalistic philosophy, which he thought little less than satanic. The religious speculations of Eckhart, St. Martin, and especially Böhme, were more to his mind. He held intimate friendship with Jacobi, and learned something of Schelling. Though deeply interested in philosophy, he kept to his engineering practice, became superintendent of mines, and was ennobled for valuable services. His first published work was *Fermenta Cognitionis*, in which he combated modern philosophy, and recommended that of Böhme. In 1826, he was appointed professor of philosophy and speculative theology in the new university of Munich. Some of his lectures, while occupying that chair, have been published. In 1838, he opposed the interference in civil matters of the Roman Catholic church, to which he belonged, for which opposition he was interdicted from lecturing on the philosophy of religion during the last three years of his life. He also favored a reconstruction of the church—a church without a pope. B. is considered to have been the greatest speculative Roman Catholic theologian of modern times, and his influence has gone beyond the bounds of his own church.

BA'AL, a Hebrew word signifying *lord*, *owner*, or *master*, and applied as a general title of honor to many different gods. In Hosea ii. 16, it is mentioned as a name which had been given to Jehovah himself; but when used with the definite article, it specially designated the principal male deity of the Phœnicians and Carthaginians, as Baaltis or Astarte was the principal female deity. In connection with Babylon and Assyria, the same deity is spoken of under the name of Bel or Belus. Originally, B. was the god of the sun, the ruler and vivifier of nature, and Astarte the goddess of the moon. In the later star-worship of the western Asiatic nations, B. was the name of Jupiter, the planet of fate, or, as some suppose, of Saturn. The proper Phœnician name of B., however, was Melkart, Melkrat, or Melchrat, which is usually supposed to mean "king of the city"—i.e., Tyre; but others consider it a contraction of two words signifying "king

of the earth;" while the learned Selden is of opinion that it is equivalent to "strong king." B. was perhaps the same god as the Phœnician Moloch. The Greeks confounded B. or Melkart with their own Hercules; and, for the purpose of distinction, termed him the Tyrian Hercules. From the earliest foundation of Tyre, he seems to have been the tutelar god of that city, and his worship apparently extended thence until it was prevalent in all the towns of the Phœnician confederation, and was established in their remotest colonies, such as Malta, Carthage, and Cadiz. It also overspread the neighboring countries of Assyria and Egypt. Each country or locality had its B. or chief god. According to Scripture, the temples of this idol (at least in Phœnicia and Assyria) were built on the tops of hills, or still more frequently in solemn groves, and sometimes altars were erected to him on the roofs of houses. His priests were numerous. Incense was the most frequent offering presented to him, but we also read of sacrifices of bullocks, and even of children. In 1 Kings, chap. xviii., we read that the priests of B. danced about the altar during the sacrifice, and barbarously cut and mangled themselves, if their god did not speedily answer their prayers.

The word B. enters into the composition of many Hebrew, Chaldee, Phœnician, and Carthaginian names, such as Jezebel, Hasdrubal ("Help of Baal"), Hannibal ("Grace of Baal"), Ethbaal ("With Baal"), Baal-bec ("City of Baal"). The word is also frequently found in conjunction with some epithet, and in such cases appears to have denoted a different deity, though it is not impossible that it may have been the same person regarded in another aspect, and as exercising merely a different function. Thus, we have Baal-Berith, "the Covenant Lord," who was specially worshiped by the people of Shechem; Baal-Peor, the *Priapus* of the Moabites and Midianites; and Beelzebub, or Baalzebub (the Fly-god), the idol of the Philistines at Ekron, where he had a temple.—The Celtic deity Beal is usually identified with Baal. See BELTEIN.

BAAL'BEK, the name of a ruined city in the ancient Cœle-Syria, signifies the "city of Baal," the sun-god, and was by the Greeks, during the Seleucide dynasty, converted into Heliopolis. Lat. 34° 1′ 30″ n., long. 36° 11′ e. It is situated in the plain of Bukâ'a, "at the northern extremity of a low range of bleak hills, about 1 m. from the base of Antilebanon," in a well-watered and delightful locality, rather more than 40 m. n.w. of Damascus. It was once the most magnificent of Syrian cities, full of palaces, fountains, and beautiful monuments. It is now only famous for the splendor of its ruins, of which three deserve special notice. The most imposing is that of the great temple of the Sun, which was a rectangular building, 290 ft. by 160, having its roof supported by a peristyle of 54 Corinthian columns, "19 at each side, and 10 at each end." Of these, 6 are yet standing. The circumference of these columns is about 22 ft., and the length of the shaft 58; with pedestal, capital, and entablature, they measure about 89 ft. in height. The approach to this temple was through two spacious courts, surrounded on all sides with porticoes and other buildings. Except the columns mentioned, little of the great temple, or of the buildings in front of it, is left standing, but the ground is covered with their ruins. The vast size of the stones used in the substructions is remarkable, some of them being 60 ft. long and 12 thick. South from the great temple is a smaller one, known as the temple of Jupiter. It is similar in form, having its peristyle and the walls of its cella still mostly standing. Its dimensions are 227 ft. in length, by 117 ft. in breadth, being thus larger than the Parthenon at Athens. Both temples, as well as the surrounding structures, are built of limestone, in a richly decorated somewhat fantastic Corinthian style. Besides these, there stands at the distance of 300 yards from the others a circular building, supported on six granite columns; style, mixed Ionic and Corinthian. It was once used as a Christian church.

The early history of B. is involved in darkness; but it is certain that, from the most distant times, it had been a chief seat of sun-worship, as its name implies. Julius Cæsar made it a Roman colony, and under Augustus it was occupied by a Roman garrison. B. had an oracle held in such high esteem that, in the 2d c. A.D., it was consulted by the emperor Trajan prior to his entrance on his second Parthian campaign. To test the prescience of the oracle, Trajan sent to it a blank piece of paper, which was returned to him blank. This gave him a high opinion of its powers, and he consulted it in all seriousness a second time. The response was some dead twigs from a vine, wrapped up in cloth. Trajan's decease some two years afterwards, and the transmission of his bones to Rome, was deemed a sufficient interpretation of the symbolical utterance, and confirmed the celebrity of the oracle. Antoninus Pius (138–161 A.D.) built the great temple, which the legend current among the modern inhabitants counts a work of Solomon. This temple is said to have contained a golden statue of Apollo, or of Zeus, which on certain annual festivals the chief citizens of Heliopolis bore about on their shoulders. When Christianity, under Constantine, became the dominant religion, the temple became a Christian church. In the wars that followed the taking of the city by the Arabs, who sacked it in 748 A.D., the temple was turned into a fortress, the battlements of which are yet visible. The city was completely pillaged by Timur Bey, or Beg, in 1400 A.D. Both city and temple continued to fall more and more into decay under the misery and misrule to which Syria has been subject ever since. Many of the magnificent pillars were overturned by the pashas of Damascus merely for the sake of the iron with which the stones were bound together. What the Arabs, Tatars, and Turks had spared, was destroyed by a terrible earthquake in 1759. B. is now an insignificant village, with a pop. of some

few hundreds. See Wood and Dawkins's *Ruins of Baalbec* (1757); Cassas, *Voyage Pittoresque de la Syrie* (1799); Murray's *Handbook for Travelers in Syria and Palestine;* Baedeker's *Syria and Palestine* (1875).

BA'BA, a Turkish word signifying *father*, originating, like our word *papa*, in the first efforts of children to speak. In Persia and Turkey, it is prefixed as a title of honor to the names of ecclesiastics of distinction, especially of such as devote themselves to an ascetic life; it is often affixed in courtesy, also, to the names of other persons, as Ali-Baba.

BA'BA, CAPE, a bold rocky headland near the western extremity of Anatolia—the Lectum of the Greeks—in lat. 39° 29′ n., long. 26° 4′ e., about 12 m. from the northern extremity of Mitylene, the ancient Lesbos. On a shelving point of the cape stands the town of Baba, with a pop. of about 4000, who do some trade in cutlery of a superior quality. The once large and prosperous, but now utterly ruined city of Assos, mentioned by St. Paul, is in the vicinity.

BABATAG', or BA'BA DAG, a city with 10,000 inhabitants, in the sandjak of Silistria, in the north-eastern part of European Turkey. It is situated in a marshy district; has a high school and five mosques, of which that built by Bajazet I. is the finest. It was Bajazet that founded the city, which he peopled with Tartars, and named after a saint, whose monument, on a hill near by, is resorted to as a place of pilgrimage. Through the port of Kara-Kerman, lying a short way to the s., the inhabitants of B. carry on a considerable commerce with the Black sea.

BAB'BAGE, CHARLES, b. in 1790, entered early at Trinity college, Cambridge, where he took his degree of B.A. in 1814. In 1828, he was elected professor of mathematics in his own university, an office which he filled for 11 years. B. united, in the most happy combination, powers of invention and observation with thorough scientific culture. Among his writings, we notice first his extremely correct and well-arranged *Tables of Logarithms* (Lond. 1834). He was the first to make the method of constructing such tables the object of earnest study. The difficulty of securing accuracy in getting up tables on a large scale, led him to the idea of committing the execution of the work to a machine. Being commissioned by the government to superintend the construction of such a machine, before beginning the work, he visited a great many manufactories and machine establishments, both in Britain and on the continent, in order to become acquainted with all the resources of mechanical art, and thus be in a position to make a combined use of them in his great undertaking. This survey afforded him the necessary information for his able work, *On the Economy of Manufactures and Machinery* (Lond. 1832)—a book which has run through several editions, and been translated into several languages—in which all mechanical processes are classified from the most scientific point of view, and the most interesting examples of the more important kinds of manufacture are described. Besides his *Comparative View of the Different Life-assurance Societies*, his *Differential and Integral Calculus*, his *Decline of Science* (1830), *A Ninth Bridgewater Treatise*, and *The Exposition of* 1851 (1851), B. contributed a number of very ineresting papers to the Transactions of the royal societies of London and Edinburgh.—With regard to B.'s calculating machine, which, from some cause not well explained, was never completed, see CALCULATING MACHINE. He died Oct. 18, 1871.

BABBITT METAL, an alloy containing 4 parts of copper, 24 of best Banca tin, and 8 of antimony. To the melted copper half the tin and the antimony are added gradually, followed by the rest of the tin. The product is a soft metal, much used for reducing friction of axles in heavy machinery, the journals being so made that the babbitting may be readily renewed when worn. It was invented by Isaac Babbitt, 1799–1862, a goldsmith of Taunton, Mass. Congress rewarded him with a gold medal and $20,000.

BABCOCK, RUFUS, D.D., b. Conn., 1798; a graduate of Brown university; Baptist minister, ordained in 1823, and established at Poughkeepsie, N. Y., and afterwards at Salem, Mass.; in 1833, he was president of Waterville college; in 1836, pastor in Philadelphia; again in Poughkeepsie in 1839, and lastly in Paterson, N. J. He has been secretary of the Pennsylvania colonization society, of the American Sunday-school union, and of the American and foreign Bible society; editor of the *Baptist Memorial*, and author of *History of Waterville College*, *Tales of Truth for the Young*, *The Emigrant Mother*, etc.

BA'BEL, TOWER OF. For an account of this building, and the confusion of tongues which it brought about, see the 11th chapter of Genesis. The distinction of being a remnant of the tower of B. has been claimed for three different masses: 1st, for Nimrud's tower at Akkerkuf; 2d, the Mujellibe, 950 yards e. of the Euphrates, and 5 m. above the modern town of Hillah; 3d, the Birs Nimrud, to the w. of that river, and about 6 m. to the s.w. of Hillah—the whole situated in Babylonia (q.v.). The last of these has the majority of opinions in its favor. Every one, it is said, who has seen the Birs Nimrud, feels at once that, of the ruined mounds in this region, there is not one which so nearly corresponds with his previous notions of the tower of Babel. According to Mr. Rich, it is of an oblong form, the total circumference being 762 yards. At the eastern side it is cloven by a deep furrow, and is not more than 50 or 60 ft. high; but on the western side it rises in a conical figure to the elevation of 198 ft.; and on its summit is a solid

pile of brick 37 ft. high by 28 in breadth, diminishing in thickness to the top, which is broken and irregular, and rent by a large fissure extending through a third of its height. It is perforated by small square holes, disposed in rhomboids. The fire-burnt bricks of which it is built have inscriptions on them, and so excellent is the cement, which appears to be lime-mortar, that it is nearly impossible to extract a brick whole. The other parts of the summit of this hill are occupied by immense fragments of brickwork, of no determinate figure, tumbled together, and converted into solid vitrified masses, as if they had undergone the action of the fiercest fire, or had been blown up with gunpowder, the layers of brick being perfectly discernible. These ruins stand on a prodigious mound, the whole of which is itself in ruins, channeled by the weather, and strewed with fragments of black stone, sandstone, and marble. Sir R. K. Porter has shown that the intense vitrifying heat to which the summit has been evidently subjected, must have been the result of fire operating from above, and was probably produced by lightning. This is a curious circumstance, taken in connection with the ancient tradition that the tower of B. was rent and overthrown by fire from heaven. Porter thinks that the works of the Babylonish kings, especially the stupendous temple of Belus, which was erected on the site of the old tower, concealed for a while the marks of the original devastation; and that now the destructions of time and of man have reduced it to nearly the same condition in which it appeared after the confusion. Mr. George Smith discovered the legend of the building of B. among the Assyrian tablets in the British museum, and gave an account of it in his *Chaldean Account of Genesis* (1875).

BAB-EL-MAN'DEB (i.e. "the Gate of Tears") is the name of the strait between Arabia and the continent of Africa, by which the Red sea is connected with the gulf of Aden and the Indian ocean, so called from the danger arising to small vessels from strong currents. The Arabian peninsula here throws out a cape, bearing the same name as the strait, rising to the height of 865 ft. About 20 m. distant from this cape stands the wall-like coast of Africa, rising in Ras Sejan to the height of 380 ft. Within the straits, but nearer to Arabia, lies the bare rocky island of Perim (q. v.), now occupied by the English as a fort; the strait on the e. side of this island is called the little strait, and that on the w. the great strait. The depth of the former varies from 8 to 12 fathoms; that of the latter reaches 185 fathoms. The first is usually chosen by vessels on account of its affording good anchorage. Close to the African coast lie eight small islands, called the Eight Brothers.

BA'BER, or BA'BUR (Zohir-Eddin Mohammed), the first of the Great Moguls in India, a descendant of Timur, was b. in 1483. He was barely 12 years of age when he succeeded his father, Omar Sheikh Mirza, in the sovereignty of the countries lying between Samarcand and the Indus. With a view to the conquest of India, although constantly contending with revolts in his own dominions, he made himself master, by fraud and force, of the provinces of Kashgar, Kundez, Kandahar, and Cabul. Having thus opened the way to India, he made two or three rapid incursions into Hindustan; and finally taking advantage of the feeble government of Ibrahim Lodi, about the end of 1525, he crossed the Attock (the Cabul branch of the Indus), quickly defeated some bodies of troops that opposed him in the Punjab; and at last, in April, 1526, on the plain of Panipat, not far from Delhi, encountered and fought a decisive battle with his enemy, whose army was far superior in numbers. The 100,000 men and 1000 elephants of sultan Ibrahim were dispersed; Ibrahim himself fled; and B. made his entry into Delhi. In the following month, Agra, the second city of the empire, surrendered. B.'s enjoyment of empire in India was short; he died in 1530, having had to contend during the five years of his reign with numerous conspiracies and revolts. To the talents of a general and statesman, which he manifested in his conquests, his improvements of public roads, measuring of lands, adjustment of taxation, postal arrangements, etc., B. united a taste for science and art. He wrote, in the Tartar language, the history of his own life and conquests, which was translated into Persian by Abdul Rachim, and, more recently, from the Persian into English. B. was succeeded on the throne of Delhi by the eldest of his four sons, Humayun, and was the founder of the B. or Great Mogul dynasty.

BABEUF, FRANÇOIS NOEL, generally known by the name of "Caius Gracchus," which he affixed to his political articles, was b. in 1764 at St. Quentin, in the department of Aisne, France. On the breaking out of the revolution in 1789, he became a fanatical advocate of the popular demands. During the reign of terror he took up a position of hostility to Robespierre and the terrorists. In his journal, established at Paris, in July, 1794, and termed *The Tribune of the People,* he preached the sovereignty of the masses, and defended the absurdest consequences flowing from that political doctrine. He was in favor of a new distribution of the land, of the abolition of every political order, and the equality of all individuals, wise and foolish. His violent language caused him to be imprisoned. On his release, he attached himself to the members of the extreme Jacobin party, which had just been overthrown. A secret conspiracy was formed, the aim of which was the destruction of the directory, and the complete re-establishment of the democratic constitution of 1793, which had been suspended during the reign of terror. The plot was discovered through the treachery of one of the members. B. and other chiefs were seized, imprisoned, and ultimately brought to trial. B. defended himself with the courage of a fanatic, and overwhelmed his judges with abuse. He was of

course condemned to death, and was guillotined on the following day, May 24, 1797. B. was a weak-headed enthusiast, without talent or culture; but abler men in the conspiracy made use of his furiously resolute character to secure the ends they had in view.

BABINGTON, ANTONY, an English gentleman of the county of Derby, head of a conspiracy in favor of Mary Stuart of Scotland. The rivalry between queen Mary and queen Elizabeth of England was at the same time a contest between Catholicism and Protestantism. Accordingly, the various plots for rescuing Mary from the power of her enemy were of the same character, and have been misrepresented and judged of according to the ecclesiastical prejudices of each historian. B., young, rich, a zealous Catholic, and on that account already an enthusiastic admirer of the unfortunate Mary, was induced, through the agents of a determined conspirator, Morgan, who had been arrested in France at the instance of the English court, to put himself at the head of a plot that had for its object the murder of queen Elizabeth, and the rescue of Mary. The execution of the murder was undertaken by one Savage, in which he was to be assisted by a number of the Catholic nobility, as circumstances might require. The day of action was fixed for the 24th of Aug., 1586. B. reserved the deliverance of Mary for his own share, entered into correspondence with her, and received letters purporting to be from her in return, approving of the assassination of Elizabeth. The secretary, Walsingham, not only had all the threads of the plot in his hand, but contributed, through his emissaries, to spur on the conspirators to the execution of their plans. When the right moment was come, B. and his accomplices were arrested, and condemned. B. made no denial, acknowledged the letters to Mary to be his, and, Sep. 20, 1586, laid his head on the block. Savage, Barnwell, Bollard, Abington, Tichburne, and Tilnec, had a like fate. Mary Stuart herself had, four months later, to ascend the bloody scaffold; and her condemnation was justified chiefly on the ground of those letters received by Babington. Mary, however, denied to the last moment that the letters were written by her hand, or with her knowledge; and her friends constantly maintained that they were the work of Walsingham himself, in order that the unhappy queen might be got rid of with a show of justice. The rest of Walsingham's conduct in this affair, as well as the way in which he was in the habit of supporting Elizabeth's views in general, give at least a high degree of probability to the accusation.

BABINGTON, CHURCHILL, b. England, 1821; professor of archæology; has written on botany, ornithology, numismatics, archæology, etc., and edited the orations of Hyperides from recently discovered manuscripts.

BABISM (from BÂBI, or BÂBY); the appellation of a sect in Persia, founded by Seyd Mohammed Ali, b. about 1824, who assumed the name of "Bâb," i.e. "the gate." On returning from a pilgrimage to Mecca in 1843, Seyd appeared in his native city (Shiraz) with a new commentary on the Koran, and soon became engaged in controversy with the regular priests, who, exasperated by his free criticism of their conduct, obtained an order forbidding him to teach in public and confining him to his house. Here he taught privately, increasing his pretensions, and declared that he was Nokteh, "the point;" not merely the recipient of a new divine revelation, but the focus in which all preceding dispensations would converge. He gained proselytes rapidly, among them a woman—a wonderful circumstance in any country of the east—known as Gourred-Oul-Ayn ("Consolation of the Eyes,") because of her surpassing loveliness. The new religion made rapid progress, and the efforts of the authorities to suppress it produced civil war. Hussier, one of Seyd's disciples, was taken, after defeating several expeditions sent against him, and put to death in 1849; and the next year Balfouroushi, another leader, was slain in battle. The Bâb himself was imprisoned and executed, but his death did not discourage his followers. They recognized Mirza Yahya, a youth of noble descent, as his successor, who established himself in Bagdad, where he is now, or was not long ago, living. An attempt in 1852 of some zealous Bâbis to assassinate the Shah led to a terrible persecution, in which the beautiful "Consolation of the Eyes" perished. The Bâb doctrines are essentially a system of pantheism, with additions from gnostic and other sources. All individual existence is regarded as emanating from the superior deity, by whom it will ultimately be reabsorbed. Great importance is attached to the number 7, as indicating the attributes supposed to be displayed in the act of creation; and to the number 19, which mystically expresses the name of the Deity himself, and is, moreover, the sum of the prophets among whom the latest incarnation of the divine nature is conceived to be distributed in the present dispensation. The sacred college cannot become extinct until the final judgment, the death of any of its members being immediately followed by a re-incarnation, as in the case of the grand lama. Moses, Christ, and Mohammed are considered to be prophets, but merely precursors of the Bâb. The morals of the sect are good; polygamy and concubinage are forbidden; the veiling of woman's face is omitted, and the equality of the sex is so far recognized that at least one of the 19 prophets must always be a female. Asceticism is discountenanced, mendicancy prohibited, and hospitality, charity, generous living, and abstinence from intoxicating liquors and drugs, are taught and practiced.

BA'BOO, a title of respect equal to "Mr." in English, given in India to educated and wealthy natives noted for liberal views, public spirit, and generosity.

BABOON, *Cynocephalus*, a genus of the monkey family, or *simiadæ* (see MONKEY), and distinguished from all the rest of that family by the very elongated muzzle, which terminates abruptly, and is pierced with nostrils at the end like that of a dog. The face has, indeed, a general resemblance to the face of a dog. The dentition agrees with that of the other apes or monkeys of the old world, to which the baboons are entirely confined, being only distinguished by the remarkable strength of the canine teeth. Baboons, like almost all the monkey family in the old world, have callosities upon the buttocks; and, like the greater part of them, they have cheek-pouches. The tail of some of the species is of considerable length, that of others is a mere tubercle, with an erect tuft of hairs. The physiognomy of all baboons is repulsive, and indicates the fierceness which strongly characterizes them, and in which they differ from monkeys in general; some of the larger ones are dreaded by the inhabitants of the country in which they are found; the danger to be apprehended from them being increased by the numbers in which they usually herd together. Their fore and hind legs are so proportioned, that they walk easily, and run swiftly on the ground; but, like all other quadrumanous animals, they climb trees and rocks with great agility. Their hair is long, forming a sort of mane on the upper parts. All of them are very susceptible of cold, and they seldom live long when removed from their native tropical countries. They feed chiefly on fruits and roots: some of them inhabit barren and stony places where scorpions abound, which they seize, adroitly deprive of the sting, and devour. They are very cunning, mischievous, and revengeful; troops of them sometimes enter a plantation, not merely to plunder, but apparently to amuse themselves by destroying whatever they can find; they seem, however, always to have some appointed to keep watch, and they make off with great rapidity on the first signal of alarm. When plundering, they cram their cheek-pouches before they begin to eat. These cheek-pouches are very capacious: a B., kept in confinement, has been seen to put eight eggs into them at once, and then to take out the eggs one by one, to break them at the end, and deliberately to suck their contents. The larger baboons are sometimes hunted by dogs where they have not trees to take refuge in; but a single dog, however powerful, cannot safely attack them; a B. will seize a dog by the hind legs, and whirl him round and round till he is stupefied. Baboons are not so easily domesticated as many kinds of monkey; however, they are not quite incapable of it when taken young. "Happy Jerry," a mandrill or rib-nose B., which was long a great object of attraction at Exeter Change, used to sit with great gravity in an arm-chair, awaiting orders, which he obeyed with slowness and composure. He smoked tobacco, but did not seem much to relish it, and was rather induced to do it by a bribe of gin and water, for which his fondness was unquestionable.

As examples of baboons with tails of considerable length, may be mentioned the chacma, or pig faced B., also called the ursine B. (*C. porcarius*), a native of s. Africa; and the dog-faced B. (*C. hamadryas*), a native of Arabia, Persia, and the mountains of Abyssinia. The latter species, perhaps the only one known to the ancients, is often sculptured on the ancient monuments of Egypt, and it is supposed to have been the species of monkey to which divine honors were paid. Its body was frequently embalmed, and B. mummies are still found.—The chacma is one of the largest of the baboons, about the size of an English mastiff, and very much stronger; it is common on the mountains of Cape Colony, and in troops would be very formidable, but that they usually scamper out of the way, instead of attacking travelers, unless they are provoked. It is of a dark-brown color, with long shaggy hair. The tail is rather more than half the length of the body, and is terminated by a tuft of long black hair.

The short-tailed, or almost tailless baboons, far exceed their longer-tailed congeners in ugliness. Only two species are certainly known—the mandrill or rib-nose B. (*C. mormon*), and the drill (*C. leucophæus*), both natives of Guinea. The mandrill is the largest, fiercest, and most powerful of the whole genus. The colors of its fur are very fine, of a light olive brown above, and silvery gray beneath; but besides other things unpleasant to the sight, its face is peculiarly hideous; the cheek-bones in the adult males being enormously swollen, so that the cheeks are protuberant to the size of a man's fist upon each side, and ribbed with blue, scarlet, and purple. In their native forests, mandrills generally live in large troops, and are said to put to flight every other wild beast.

BA'BRIUS, a Greek fabulist, who lived about the close of the Alexandrian age, or the beginning of the succeeding Roman-sophistic period, made a considerable collection of Æsopian fables (see ÆSOP), which he turned into verse, in a natural and popular style. Several versions and transformations of these were made during the middle ages, and have come down to us under the name of *Æsop's Fables*. Bentley, who, in his *Dissertatio de Babrio* was the first to recognize in these fables of Æsop the original work of B., endeavored to restore portions of the verses, and pointed out other fragment of the genuine B. in other quarters. A few fables were added from manuscripts by Furia, Korais, and Schneider, and all that was known at the time was collected by Knoche (Halle, 1835). At last, in 1842, a Greek of the name of Minoides Minas, employed by the French government to explore the convents of the east, discovered a manuscript with 123 hitherto unknown fables of B., a copy of which he made and brought to Paris, where they were published in 1844. The best edition is that by Lachmann (Berl. 1845).

BABUYANES ISLANDS, in the Pacific between the Loo Choo islands and Formosa; Calayan and Babuyan are the most important. They are fertile, and furnish a large quantity of sulphur. Batan is the largest town. Pop. of the islands est. 8,000.

BABYLON—BABYLONIA. Babylonia was the name given in ancient times to the flat country about the lower course of the Euphrates, called in modern times Irak-Arabi. In the Old Testament, it is call Shinar, Babel, and also "land of the Chaldees;" and by the later Greek and Roman writers, occasionally Chaldea. Its proper boundaries were: on the n., towards Mesopotamia. the Euphrates and the Median Wall, which extended from the junction of the Chabur with the Euphrates to the Tigris; on the e., towards Assyria and Susiana, the Tigris; on the s., the gulf of Persia; and on the w., the desert of Arabia. During the wider extension of the Babylonian dominion, the name comprehended also Assyria and Mesopotamia. The country forms a perfect plain, which is a continuation of that of Assyria. The two rivers, Euphrates and Tigris, here approach each other most nearly, until their blended waters fall into the Persian gulf. The country was once protected from flooding by numerous canals and embankments, and several artificial lakes, which are now mostly in ruin. The most important canal was that now known as Nahr-el-Melik, which is undoubtedly the ancient royal canal that joined the two great rivers. It was kept in repair by the Roman emperors, and was serviceable as late as the 7th century. The soil, naturally fertile, was rendered more so by the garden-like way in which it was cultivated, and yielded abundant crops, especially of wheat, barley, and dates. The want of stone and wood was more severely felt than in Assyria. The only building material was brick, for which the soil afforded abundance of clay. The bricks were either dried in the sun or burnt, and were very durable, resisting, in the ruins, the effects of the weather to this day. Mineral bitumen, springing up everywhere in abundance, served as mortar. In this favored plain, the human race attained early a state of social and political organization, the oldest, indeed, that antiquity gives us any account of.

Until recently, the early history of Babylonia was doubtful and dark. The only sources were a few incidental notices in the Bible; some fragments derived at third hand from the perished writings of Berosus, a Babylonian priest, who had translated the annals of his country into Greek; and lastly, the notices of Greek writers, chiefly Herodotus. But the whole is confused and contradictory, and history and mythology were jumbled together.

But light is now breaking in upon the darkness. In recent years, multitudes of brick tablets, stamped with cuneiform (see CUNEIFORM) characters, have been dug up from the ruins of the great cities that once studded the banks of the Tigris and Euphrates; and in these we find ourselves in possession of contemporaneous records of events reaching back 30 c. before the Christian era, and restoring a page of human history that was apparently lost.

At the earliest period to which the records carry us back, the population of the whole valley of the Tigris and Euphrates consisted mainly of tribes of Turanian origin, their language having remarkable affinities with those of the Ural-Altaic group of the Turanian nations, e.g. the Finns, the Magyars, and Turks. Closely allied tribes occupied the whole region s.w. of the Caspian sea—Media, Armenia, Elam, Susiana. In that region lies Ararat, the "Mountain of the World," and to that region the traditions of those Turanians pointed as the cradle of their race. But the earliest records reveal the existence of a Semitic element in the population of the Euphrates valley, coming in apparently from the s.w.—Arabia and Egypt. The infiltration of this foreign element went on increasing for centuries, until at last it got the upper hand, and the Babylonians and Assyrians, when they became known to the historians of the west, were essentially Semitic peoples. Their civilization, however, was merely a development of what they took up from the original inhabitants.

The dominant people in Babylonia in the earliest times were the Accad, or Accadians. They had come originally from the mountains of Elam, to the e. of the Tigris, and hence their name Accad, which means "highlanders." They brought with them the art of cuneiform writing, as well as other arts and sciences, especially astronomy. It is in the Turanian language of these Accadians that the cuneiform inscriptions of Babylonia are written for many centuries. And when the Semitic tongue had become predominant, Accadian, now a dead language, was to the Assyrians what Latin has been to the nations of modern Europe: Assyrian scholars translated the Accadian literature into their own language, and their technical and sacred terms were borrowed from it. Every day is bringing to light new proofs of the influence of these Accadians upon the civilization of the Semitic nations, and through them upon that of Europe. Greece, it is well known, derived its system of weights and measures from the Babylonian standards; but these have been proved to be of Accadian origin. The Greek *mina* or *mna*, the fundamental unit of the Greek monetary system, is the *maneh* of Carchemish, and *maneh* is found to be not a Semitic but an Accadian word, showing the origin of the system. The sexagesimal division of the circle; the signs of the zodiac; a week of seven days, named as we now name them, and the seventh a day of rest, are all Accadian. Every large city had its public library. In the royal library of a Babylonian monarch, Sargon (about 2000 B.C.), every tablet was numbered, so that the reader had only to write

down the number of the tablet he wanted, and it was handed to him by the librarian. Among the multifarious subjects of this extensive literature there are hymns to the gods strikingly like the Hebrew psalms; and in a long mythological poem there is an episode giving an account of the deluge almost identical with that of Genesis, only more detailed. See ASSYRIA. The Accad religion was originally a Shamanism (q.v.), similar to what still prevails among the Turanian tribes of Siberia; but it gradually developed into a huge system of polytheism, which was adopted and modified by the Semitic inhabitants. The Accadians were great in magic, and the Greek *magos*, a magician, is derived from an Accadian word equivalent to "reverend."

The city of Babylon was not the first seat of power. The earliest records yet discovered are those of a monarch whose capital was Ur (now Mugheir). Art was already far advanced, and the extent of the monarch's resources is seen in the ruins of the temple of the sun-god built by him; it is calculated that 30,000,000 bricks must have been used in its construction. Centuries, apparently, after this, a fresh invasion from Elam is recorded, to which the exact date can be assigned of 2280 B.C. Another Elamite conqueror, named Cudur-mabug, extended his sovereignty over Palestine, and it is inferred that a sovereign of this dynasty is the Chedorlaomer of Genesis (the name in Accad would be *Kudurlagameri*, "worshiper of the god Lagamaru"). Some time after this, the seat of power was finally fixed at Babylon, and the Semitic tongue now began to supersede the Accadian.

The cities in the northern division of the country had been founded by colonists from the s., and were long ruled as dependencies of Babylonia. At length they grew into the independent kingdom of Assyria; and in the 14th c. B.C. an Assyrian monarch captured Babylon. From that time the position of the southern state becomes more and more subordinate to the northern, and finally sinks into a province. Babylonia, however, was not always a submissive vassal. Under the leadership of Chaldean chiefs, it made many struggles for independence. The Chaldeans are first heard of in the ninth c. before Christ as a small Accadian tribe on the Persian gulf; but they became so prominent in these struggles that they latterly gave their name to the whole province of Babylonia, which came to be styled Chaldea. The name of one of those Chaldean chiefs, Merodach-Baladan, occurs both in scripture and in the inscriptions. From the former, we know that this king sent a message to Hezekiah, king of Judah, ostensibly to inquire about his recovery, probably with a view to an alliance against Assyria; and from the latter, that Merodach was expelled by Sargon, king of Assyria, that he made a fresh attempt to recover his throne, and was finally dethroned by Sennacherib. The complete subjection of B. to Assyria at this time (680 B.C.) is proved also from the scripture account, which states that Esarhaddon, son of Sennacherib, reigned in Babylon. About fifty years afterwards, Nabopolassar, governor of B. for the Assyrian king, proved faithless to his trust, and entered into an alliance with the Median king, Cyaxares, for the overthrow of the ruling state. See ASSYRIA. This undertaking was successful, and B. now (625 B.C.) became, though it was but for a short time, an independent and conquering power. The son of Nabopolassar, Nebuchadnezzar II., next defeated the Egyptian king, Necho, at Circesium (Karchemish), on the Euphrates (604 B.C.), and thus annihilated the Egyptian dominion in Asia. He then subdued Jehoiakim, king of Judah; and in consequence of repeated revolts, destroyed Jerusalem, and put an end to the kingdom of Judah under Zedekiah (588 B.C.), carrying the inhabitants captive to Babylon. The Phenicians submitted to him voluntarily, with the exception of Tyre, which underwent an obstinate siege without yielding. After a fortunate expedition against Egypt, Nebuchadnezzar turned his attention to the adornment of his capital; and the greater part at least of those buildings usually ascribed to a very early period, and especially to the mythical Semiramis, belong to him. After his death (562 B.C), the Neo-Babylonian empire fell to pieces as suddenly as it had sprung up, and under Nabonedus (Nabunita, in the cuneiform inscriptions, and in Herodotus, Labynetos), who had entered into an alliance with Crœsus of Lydia, against Persia, it came under the dominion of Cyrus (529 B.C.). The Belshazzar of scripture is thought to be the son of Labynetos, to whom was confided the defense of B., while the elder prince held Borsippa. From this time B. appears on the Persian monuments as a Persian satrapy, under the name of Babirus.

With the overthrow of the Persian monarchy, B. came under the short lived dominion of Alexander the Great, who died in that city (323 B.C.). Seleucus I., to whom it had been promised at the conference of Triparadisus, contested and won the possession of it from Antigonus (312 B.C.). About 140 B.C., it was taken from the Syrian monarchs by the Parthians. It came into the hands of the Romans only temporarily, first under Trajan (114 A.D.), under Septimius Severus (199 A.D.), and again, under Julian (363 A.D.). When, in 650, the successors of Mohammed put an end to the new Persian monarchy of the Sassanides, the province of B., where Bagdad was built (762–766), became the seat of the califs till 1258. Since 1638, when the Turks, for the second time, took it from the Persians, it has been under the dominion of Turkey, divided into the pashalics of Bagdad and Basra.

The classic writers represent the civilization of the ancient Babylonians as of a high stamp. The government was despotic, of a kind to suit a crowded, luxurious, and effeminate population. Arts and commerce were highly flourishing—the last was

carried on by caravans with Bactria, Persia, and Media, perhaps as far as India, and by shipping on the Persian gulf with Arabia. B. was famous for its dyes, its cloths, and embroideries, especially for the manufacture of rich carpets with inwoven figures of strange animals and arabesques, such as we yet see on the Nineveh sculptures. The general prosperity was such, that B. and Assyria together were able to pay to Persia, in the time of Darius Hystaspes, a yearly tribute of 1000 talents (upwards of £280,000)—a sum greater than that contributed by any other province.

The Babylonians were notorious for their effeminacy, luxury, and licentiousness. Their religion was nearly allied to that of the Phenicians. The essential part of it was the worship of the powers of nature, as they are manifested in the larger heavenly bodies and in the fertility of the earth. At the head of their system of belief stood Baal (see Baal), reverenced through the whole of Mesopotamia and Canaan, who represented, in a general way, the power of nature, without having any moral significance, and was specially identified with the sun. Along with him stood, as feminine complement, the goddess Baaltis, the receptive earth, with whose worship all manner of licentious rites were associated. She makes her appearance principally as Melyta or Mylitta—i.e., "the causer of generation." How nearly she is related to Ashtaroth (among the Greeks, Astarte), whose functions are so similar, it is not easy to determine. Education and religion were in the hands of the caste of the Chaldees, who occupied themselves at the same time with astronomy and astrology, and kept records, from the earliest times, of their astronomical observations, associating with them the chronicles of their kings. Their scientific acquirements must have been considerable. Engraved cylinders and gems, and the remains of their pottery, testify to their progress in these departments of art; and their architecture, according to the testimony of the ancients and the ruins still remaining, deserves to be ranked high.

Apart from canals, bridges, embankments, and sluices, the interest on the subject of Babylonian architecture is concentrated in the ruins of the capital, Babylon. The accounts that we find in the ancients of the origin, the greatness, and the structure of the city, are exceedingly confused. The god Belus is named as its founder, and also queen Semiramis; how we are to understand the two statements is not explained. Semiramis, according to the account of Diodorus, employed on it two millions of work men, collected from all parts of her dominions. With the capital of the older kingdom, the accounts of the ancients known to us have, for the most part, nothing to do; they are all to be referred to the resuscitated and adorned residence of Nebuchadnezzar. Herodotus gives a description of the city, apparently from his own observation. It stood on both sides of the river, in the form of a square, the length of whose sides is variously given; by Herodotus it is stated at 120 stadia, making the whole circumference 60 miles. It must be remembered, however, that the walls, like those of most oriental towns, inclosed rather populous districts than cities, so that the whole mass of the population might easily find shelter within the space inclosed. It was surrounded by a wall 200 cubits high, and 50 cubits thick, and furnished with 100 brazen gates—the last number is raised by Diodorus to 250. The city was built with extreme regularity, with broad straight streets crossing one another at right angles; and the two parts were connected by a roofed bridge built of hewn stones, fastened together with iron clamps. Of this bridge, not a trace has yet been discovered. The western part of the city is undoubtedly the older, belonging to the early and properly Babylonish dynasty. Here stood, in the middle of the city, as it is described, the famous temple of Belus or Baal, called by the Arabs, Birs Nimrud. See Babel, Tower of. The next important point on the w. side is the mass of ruins called Mujellibe, which was probably the royal citadel of the old Babylonian monarchy. On the e. side of the river stood the buildings of the Neo-Babylonian period, among which the "Hanging Gardens" of Semiramis are to be singled out as one of the wonders of the world. Of these gardens, Diodorus has left us a detailed description. Their ruins may be recognized in the mound called El-Kasr. The city suffered greatly from the Persian conquest. When it revolted under Darius I., and, after a siege of two years, was recaptured through the ingenuity of Zopyrus, the outer walls were demolished. Xerxes plundered the temple of Belus, which had been hitherto spared, and Herodotus found it empty. Although the Persian kings made B. their residence, nothing was done for the restoration of the city; and Alexander the great, who, on his entrance, in 331 B.C., had promised the inhabitants to rebuild the ruined temple, was unable even to clear away the rubbish, although he employed 10,000 workmen for two months. After his death in the palace of Nebuchadnezzar, and the foundation of Seleucia on the Tigris by Seleucus Nicator, B. went rapidly to decay. This was partly owing to the new city's being built of the materials of the old, and partly to the want of durable materials for monumental buildings. Stones of any size had to be brought from the mountains of Armenia; their place was mostly supplied by burned brick. As early as the time of Pausanius, there was little to be seen but the ruins of the walls. The older Arabian geographers know, indeed, of a village, Bâbil, but speak more of the great masses of ruins. Since the time of Della Valle, who erroneously looked upon the ruin Mujellibe as the tower of Belus (in which he is followed by Rennel), the site of B. has been the object of many travels and researches. The greater number of the explorers, among whom Rich is the most distinguished, consider the town of Hillah, with 7000 inhabitants, as the representative of the ancient

Babylon. The great masses of ruins, from which we must not, with Rennel, exclude the Birs Nimrúd, embrace, indeed, an enormous extent, but agree perfectly with the accounts of the ancients in being arranged in the form of a square. Some time ago, Rawlinson transferred the site of B. to Niffer; but before anything can be determined, researches must be made on the spot, which could hardly fail to lead at the same time to valuable results, like those of Botta and Layard in Assyria, and increase the collection of cuneiform inscriptions, which are yet only fragmentary. See Rich's *Memoirs on the Ruins of Babylon*, and his *Personal Narrative of a Journey to England by Bussorah, Bagdad, the Ruins of Babylon;* Rawlinson's *Five Great Monarchies;* Layard's *Nineveh and Babylon;* Lenormant's *Langue Primitive de la Chaldée; Transactions of the Society of Biblical Archæology;* Smith's *Assyrian Discoveries;* Sayce's *Babylonia*, in the *Encyclopædia Britannica.*

BABYLONISH CAPTIVITY. In the despotic policy of the east in ancient times, it was a rule to remove the rich and leading inhabitants of a conquered province to a distant part of the empire, where they were separated by nationality, language, customs, and religion from the great body of the population, and thus rendered politically harmless; while the people that remained behind were by this means deprived of influential leaders. The inhabitants of Judea underwent oftener than once a deportation of this kind, after they came into conflict with the powerful kingdom of Assyria. Thus, the kingdom of Israel was put an end to under king Hosea (722 B.C.), by the Assyrian monarch Shalmaneser, who, after taking the capital, Samaria, carried the principal inhabitants into captivity in Assyria, and brought stranger tribes into the land of Israel in their stead; these, with the Israelites that remained, formed afterwards the mixed nation of the Samaritans. The most remarkable exile, however, befell the tribe of Judah under Nebuchadnezzar. Zedekiah, king of Judah, warned in vain by the prophet Jeremiah, allied himself with the king of Egypt against the sovereignty of Babylon. Nebuchadnezzar soon appeared with a powerful army before Jerusalem, which he took (588 B.C.). King Zedekiah had his eyes put out, and he and the principal part of the inhabitants were carried captive to Babylon. It is this captivity, the duration of which is usually reckoned at 70 years, although, strictly speaking, it lasted only 56 years, that is called, by way of distinction, "the Babylonish captivity." The situation of the exiles was in other respects tolerable. Most of them settled down, and acquired property, and even riches; many were called to court, and even raised to high offices in the state. They were allowed to retain their organization by families, and lived by themselves essentially according to the Mosaic law. They had also their own chief, and were allowed the free exercise of their religion. Nor did they want consolation and encouragement; for Ezekiel raised among them his powerful prophetic voice, and the idea of the Messiah became more clearly developed. When Cyrus overthrew the Babylonian empire (538 B.C.), he allowed the Jews to return to their own country. Only the tribes of Judah, Benjamin, and Levi availed themselves of this permission: the other ten tribes disappear from history after the captivity. It is probable that they had become so mingled with the Babylonians, a people of kindred origin, that they had ceased to remember the country of their race. Vain attempts have, in recent times, been made to discover the ten lost tribes. Some learned men have sought for them in China and India, while others have declared the Afghans to be their descendants, and even the North American Indians. A more probable conjecture, perhaps, is that they were the ancestors of the Nestorians in the mountains of Kurdistan.

BABYLONISH CAPTIVITY (*ante*), the carrying into captivity of 200,000 people of Jewish cities, about 713 B.C., by the officers of the king of Assyria. Before this, however, there was the "Assyrian captivity," the result of the invasion of the kingdom of Israel by three or more successive Assyrian kings. About 762 B.C., Pul imposed a tribute upon Menahem. About 738 B.C., Tiglath-Pileser carried away in large part the trans-Jordanic tribes and the inhabitants of Galilee. Shalmaneser made two invasions, and, in 720, after a siege of three years, took Samaria and carried many Israelites away as captives, populating Samaria by Babylonians and other foreigners. It is supposed that Tiglath-Pileser took the Israelites away to people his great city. His successor, Shalmaneser, made Hoshea, the king of Israel, a tributary, and when the tribute was not paid he took Samaria by way of punishment, and carried to Assyria the king and all the most desirable remaining population of the ten tribes. These were settled in distant cities, and their places were supplied by colonies from Babylon and Susis. As captives, the people were treated with no especial harshness. They were not bondmen, as one might suppose from the term "captive;" but even in Babylon their elders retained the power of life and death over their own people; and at a later period the Jews in the principal cities were governed by an officer of their own nation, as was the case in Egypt under the Ptolemies. The Jews in Assyria themselves held slaves; the book of "Daniel" tells of a Jew in high political station, and in "Esther" we find their power and consequence in the Persian empire celebrated. Doubtless their lot was more comfortable than that of other conquered nations among whom they dwelt. Much effort has been made to discover the ultimate condition or fate of the ten tribes. Josephus in his day thought that they dwelt in large communities somewhere beyond the Euphrates. Rabbinical tradition makes the same assertion, with many imaginative exemplifications. Christian

writers have traced them all over the world. Some find them among the Afghans; some tell of a Jewish colony at the foot of the Himalayas; the "Black Jews" of Malabar claim an affinity or descent from them; they have been supposed to be fathers of the Tartars, of the Nestorians, of the North American Indians, and by some recent scholars of the Anglo-Saxons. The best that can be done, in the light of established history, is to trace their footsteps in four directions. After the captivity, some returned and mixed with the Jews; some assimilated with the Samaritans and became enemies of the Jews; many remained in Syria, mixing there with other populations, and forming colonies throughout the east; but most of them probably apostatized in Assyria, adopting the idolatry of the nation around them, and were finally merged into the stronger and more numerous people.

The second, or "Babylonian captivity," consists of two distinct deportations. Nebuchadnezzar made several invasions of Judea, and finally destroyed Jerusalem and the temple, and carried the people to Babylon. The first principal deportation was in 598 B.C., when Jehoiachim, and all the nobles, soldiers, and artificers were carried away; the second great deportation followed the destruction of the temple and the capture of Zedekiah, 588 B.C. Although the number of persons carried away is in several instances set down, it is not probable that such numbers represent the whole deportation, for the sum total on record can be but a mere fraction of the Jewish people. The captives were treated not as slaves, but as colonists. There was nothing to hinder a Jew from rising to the highest eminence in the state or holding the most confidential office near the throne. They had no temple and offered no sacrifices; but the rite of circumcision was observed, and their genealogical tallies were kept so that they were usually able to tell who was the rightful heir to the throne of David. The first great event in the *restoration of the Jews* was the decree of Cyrus, 536 B.C., under which 42,360, with 7537 slaves and cattle and personal goods, left Babylon under Sheshbazzar. They laid the foundation of the second temple 53 years after the destruction of the first. The work was stopped almost immediately. But under Darius the Jews found favor, and under the guidance of Ezra, Nehemiah, and others Jerusalem was to some extent restored, and exiled families doubtless returned and occupied the country round about. Nevertheless, the great mass of the Jewish people remained in the countries over which they had been scattered. Before the captivity, many Jews had settled in Egypt; others in Sheba. Among those who returned to Judea, about 30,000 are said to have been of the tribes of Judah, Benjamin, and Levi. Recent students conclude that about six times as many Jews preferred to remain in Assyria, where they kept up the national distinction, and were known to their brethren as "the dispersion," that is, Jewish people residing beyond the limits of Palestine. This dispersion was in three directions or countries: in Babylonia, in Egypt, and in Syria. A still later and more perfect "captivity" was that suffered by the people of Palestine under the Romans, when, after the massacre of untold myriads of their people, the Jews were reduced to abject bondage. Josephus says that 1,100,000 people were slain in the siege of Jerusalem by Titus, and 97,000 were captured and distributed among the Roman provinces, butchered in amphitheaters, thrown to wild beasts, or sold to slavery in Egypt. Doubt is cast by some writers on the numbers given by Josephus. The last stand of the Jews for national existence was about 133 A.D., when the struggle resulted in the practical extirpation of the people from their chosen land; and since that event—the rebellion of Bar-chobab—the descendants of Abraham have been unable to present, anywhere on the earth, even the semblance of an organized nation.

BABYROUSSA, *sus babyroussa*, a species of hog (q.v.) inhabiting the forests of Java and the Molucca islands, remarkable for the extraordinary tusks of the upper jaw, which rise like horns through the bone and integument, are long, somewhat slender, and curved backwards; their use being probably similar to that of horns. The animal is sometimes called the horned hog. Its limbs are much more slender than those of the common hog.

BACCHANA'LIA, or DIONYSIA, festivals in honor of Bacchus. Four were held at Athens. One was in Dec., after the vintage was over, when a nude and indecent procession was had, slaves were given brief liberty, and general drunkenness prevailed. One was in Jan., after the new wine had been pressed out, when the state bore the cost of a public banquet, a procession, and a dramatic entertainment. In Feb. came the flower festival, lasting three days; on the first the new wine was tasted, and candidates were initiated into the mysteries of Bacchus; on the second there were public games; on the third flowers were offered to Dionysius, presents were made between friends, and slaves were free for the time. The fourth, or great festival, came in Mar., and attracted strangers from all parts of the country. It was conducted by the chief archon, and paid for by the state. It included the giving of a prize for the best drama, a banquet, a procession, and theatrical performances. Like all others, this festival was a season of riotous and drunken indulgence. Bacchus was represented, accompanied by women frenzied with drink or excitement, carrying cymbals, dancing, and singing songs in honor of the god: and with them were men disguised as wild beasts, fauns, and satyrs. In Rome the excesses became so gross that the state forbade such celebrations altogether.

BACCHAN'TES, women who took part in the secret Bacchic festivals; also males, when they were admitted. In the old universities a student in his first year was a B., and was made to pay for the drinks of his elders, and otherwise abused. There was also an order of B. whose members were idle or dissipated students, getting more of their living by begging and theft than by honest occupation. Modern "hazing" may be a reminiscence of the mediæval Bacchantes.

BACCHIGLIO'NE, a river of northern Italy, having its source in the Alps, and its outlet in the Adriatic. It passes through the town of Vicenza, where it is crossed by a fine bridge of nine arches; flows through the plain of Padua, and enters the Adriatic about 3 m. s. of Chioggia. Its whole course is about 90 m., and it is navigable by large boats from Vicenza to the sea.

BACCHUS, the god of wine (called in Greek, Bakchos, Dionysos, and also, especially in the mysteries, Iakchos), was the son of Zeus and Semele, the daughter of Cadmus. Before his birth, Semele fell a victim to the insidious counsels of the jealous Here, who induced her to petition Zeus to visit her in his proper form and majesty—i.e., attended with thunder and lightning. The mother was of course consumed, but the six-months-old B. was saved by being inclosed for some time in the thigh of Zeus. He was first consigned to the care of Ino, the sister of Semele, and her husband Athamas; but when Ino and Athamas were driven mad by Here, Zeus caused him to be carried to Nysa, in Thrace, and given in charge to the nymphs. It was here that B. taught the cultivation of the vine, and prepared intoxicating drink from the grapes. In order to impart his discovery to mankind, or, as some say, because Here smote him with madness, he wandered through many countries attended by the nymphs, who were crowned with ivy and vine-leaves, and bore in their hands the *thyrsus*, a pole bound round with leaves and fruit. This expedition, according to a later form of the myth, extended to Bactria and Media, to Egypt and India, where B. is said to have erected pillars as the eastern boundary of the world. Wherever he came in his wide progress, there is a Nysa to be found. The worship of the god, which came originally from the east, and was introduced into Greece by Melampus, was thus spread over nearly the whole of the then known earth, and at the same time the myth of B. was variously modified among the different peoples, so that it has become one of the most perplexed and difficult. B. was, besides, the protector of fruit-trees, and of fruits in general. His worship being thus extensively spread, and his festivals being held with music and song, he naturally received a great many surnames; for example, he was called Lenæos, from the wine-vat (*lenos*); Bromius, from shouting, (*bromos*); Euios (in Latin, Evius), from the exclamation *Euoi*, etc. The mythical march or expedition above spoken of, was suggested to the fancy by the bacchanalian festivals, at which bacchantes roved about in feigned madness, and made midnight processions to the mountains by torch-light. B. met with much opposition on his expeditions, many refusing to acknowledge his divinity. Thus, Lycurgus, king of the Edones, opposed him, and also Pentheus of Thebes, who was on that account torn to pieces by his own mother and her sisters. The daughters of Mynias (q.v.), who refused to celebrate his festivals, were punished by him with madness and metamorphosis. As he was crossing to Naxos, the Tyrrhenian sailors wished to carry him off to Italy, and, with this view, bound him; but the chains fell off, vines and ivy entwined the ship, and held it fast in the middle of the sea. B. changed himself into a lion, and the sailors from terror leaped into the sea, where they were transformed into dolphins. Those, on the contrary, who received him with hospitality and reverence, were rewarded; such as Midas (q.v.). In general, the character of B. is mild. In works of art, his type is that of a youth inclining to effeminacy. His peculiar ornament is the fillet. The long blonde hair is bound up in a knot behind, and only a few locks fall down on both sides over the shoulders; the hair is surrounded by a twig of vine or of ivy. His figure is neither stout nor slim. He is usually represented quite naked; sometimes with a wide robe negligently thrown over, which either covers a part of the shoulders and thighs, or, though more rarely, enwraps the greater part of the body. Frequently, a deer-skin hangs across the breast; at times, he wears shoes, more rarely, buskins. From this, the properly Grecian B., the bearded or Indian B. is completely distinct. This last appears in a more dignified, lofty, regal form; he is clad in a tunic reaching to the feet, over which he wears a wide and splendid mantle. As a warrior, he wears a short tunic girded round the waist, with buskins on the feet; a panther's skin serves him for a shield. In addition, he is to be seen at times with horns. After the institution of the Eleusinian mysteries, the service of B. was conjoined with these; accordingly, Pindar makes him the companion of Demeter. As the followers of Orpheus held him to be also Apollo, he is associated with the Delphic oracle.

The worship of B. consisted in noisy rites. Thebes, in Bœotia, held to be the birthplace of the god, was considered the chief seat of those rites in Greece. In Athens, the worship of the Lenæan B. was the most ancient, and may be traced back to ante-historic times. The chief offerings made to him were goats and oxen; the last, because he himself was conceived and represented under the form of an ox. The Bacchic festivals deserving special notice are—1. The Attic Dionysia, of which the minor, or country Dionysia, was celebrated in the country in the month Poseideon, at the time of the grape-gathering. Among the characteristic amusements of the occasion were the

Askolia, which consisted in smearing full wine-skins (*askoi*) with oil, on which the young peasants attempted to leap with one foot, and by their frequent falls produced merriment. There were also dramatic entertainments. This festival was probably held at the approach of the wine-harvest, and that of the Haloa at its close. These were followed, in the month Gamelion, by the festival of the Lenæa, which was peculiar to the city of Athens. The festivities on the occasion, besides theatrical representations, consisted in a great banquet, for which the state provided the meat, and in a procession through the city, attended with the jesting and raillery usual at Bacchic ceremonies. After the Lenæa came the Anthesteria, on the 11th, 12th, and 13th of the month Anthesterion, when the new wine was first drunk. On the second day of this festival, the chief solemnity consisted in a great public dinner, at which the guests, crowned with flowers, and to the music of trumpets, entered into regular contests in drinking, and in a private sacrifice for the prosperity of the state offered by the "king archon's" wife, who was at the same time symbolically married to the god. On the third day, a sacrifice was offered to the Chthonian Hermes and to the souls of the dead. Last came the great Dionysia, which was celebrated in the month Elaphebolion, and at which new comedies and tragedies were represented. 2. The Triateric Dionysia, which were celebrated every third year in the middle of winter. The performers were women and girls (called in Gr., *Mænades;* in Lat., *Bacchæ* or *Bacchantes*), and the orgies were held at night, on the mountains, with blazing torches and the wildest enthusiasm. This mystic solemnity came from Thrace, and its institution is referred to Orpheus. When it was adopted in Greece, cannot be exactly determined. It is earliest met with in Bœotia, particularly at Thebes, where the Cithæron was the scene of celebration. An important place in connection with it is also Parnassus, on the highest summit of which the women of Attica and Delphi celebrated nocturnal orgies in honor of B. and Apollo. The Mænades or Bacchantes were clad on the occasion in fawn-skins, swung about the "thyrsus," made a great noise with clapping of hands, and danced wildly with streaming hair. In this ecstatic solemnity, the god himself was represented by the victim sacred to him, the ox, which the Mænades in their fury tore in pieces. In the most ancient times, even human sacrifices were not uncommon. Descriptions of these wild and terrible rites are not unfrequent in the poets. 3. The Bacchanalia of later times, the foundation of which was laid in Athens during the Peloponnesian war, by the introduction of foreign rites. From Greece they were carried to Italy. As early as 496 B.C., the Greek worship of B. was introduced at Rome along with that of Ceres; and Ceres, Liber, and Libera were worshiped in a common temple. In honor of these deities, the Liberalia were celebrated on the 17th of Mar., and were of a yet simpler and ruder kind than the great Dionysia of Athens. Afterwards, however, these rites degenerated, and came to be celebrated with a licentiousness that threatened the destruction of morality and of society itself. They were made the occasion of the most unnatural excesses. At first, only women took part in these mysterious Bacchic rites, but latterly men also were admitted. When the evil had reached its greatest height, the government (186 B.C.) instituted an inquiry into it, and rooted out the Bacchanalia with the greatest severity. This was the occasion of the well-known *Senatûs Consultum de Bacchanalibus*. Mention of them, however, still occurs at a later period under the emperors.—Wild, excessive revels are still called Bacchanalia.

BAC'CIO DELLA PORTA, better known by the name of FRA BARTOLOMEO DI SAN MARCO, one of the most distinguished masters of the Florentine school of painting, was b. at Savignano, in Tuscany, in 1469. His first teacher was Cosimo Roselli; but he owed his higher cultivation to the study of the works of Leonardo da Vinci. His subjects are mostly religious, and by far the greater part of his pieces belong to the later years of his life. He was a warm adherent of that bold reformer of church and state, Savonarola (q.v.), after whose tragical end he, 1500, took the habit of the cloister, and for a considerable time renounced art. The visit of the young Raphael to Florence in 1504 seems to have been instrumental in stimulating him to return to it. He imparted to Raphael his knowledge of coloring, and acquired from him a more perfect knowledge of perspective. The two remained constant friends—B., on one occasion, finishing certain of Raphael's unfinished works, Raphael performing a like kindness for him at another time. B. died at Florence, 1517. The greater number of his works are to be seen at Florence, in the gallery of the Pitti palace.

BACH, Baron ALEXANDER, an Austrian statesman, was b. Jan. 4, 1813, at Loosdorf, in lower Austria, where his father held a judicial office. The young B. received a careful education. At the age of 24, he was promoted to the rank of doctor of laws, and then entered the imperial service, in which he remained about 9 years. During this period also he traveled over the greater part of Europe and some of the countries of Asia. He was on terms of friendship with the members of the opposition of lower Austria, and belonged to that circle of young men who well understood the failings of the old system, and the inevitability of a change in the organization of Austria. He took an active part in founding the juridico-political reading club, and courageously defended it against the police. On the occurrence of the events of Mar., 1848, B. took a distinguished place as a mediator. He formed part of the provisional committee of the com-

mons, and was also chosen in April, by the states of lower Austria, one of their representatives in the central commission of the provincial states of Austria.

In this, the outset of his political career, B. already showed a leaning to those views which he afterwards manifested as minister. He advocated the centralization of the Austrian monarchy, and declared himself against the independence of Hungary, as well as against the entry of the German provinces of Austria into the German confederation. But he also desired an extension of the basis of the states, and of their parliamentary influence in the direction of public affairs. During the occurrences of the 15th of May, 1848, B. kept away from Vienna. When, after these occurrences, the old liberal opposition came to the helm, B. undertook the ministry of justice. He now entered with talent and energy into the remodeling of the whole system of Austrian law. On the other hand, the part he took in the assembly brought upon him the hatred of the "left," and of the democratic party generally. The opposition was particularly bitter on the question of removing the burdens from peasant proprietors, on which B. maintained the principle of compensation, and wished a part of that compensation to be made good by those who had hitherto borne the burdens in question. His policy, also, with regard to Hungarian affairs met with violent opposition from the "left." In the events of the 6th of Oct., 1848, B. would have fallen a victim to popular fury, like the war-minister Latour, had he not found an opportunity of withdrawing from pursuit. On the formation of the Schwartzenberg-Stadion ministry, he again took the portfolio of justice, and participated in the measures regarding Hungary and all the other important steps taken by that ministry. On the withdrawal of Stadion in May, 1849, B. took his place at the head of the ministry of the interior, from which he was sent, in 1859, as plenipotentiary to Rome—a mission which terminated in 1865. Among his most important labors as minister of the interior are the constitutions for the different crown-lands, as well as the organization of their political administration.

BACH, JOHANN CHRISTIAN, 1735–82; eleventh son of Johann Sebastian B., was chosen one of the organists of Milan cathedral, but was occupied mainly in composition for the voice. In 1763, he produced, in London, the opera of *Orione*, which was successful. Schubert says: "This man had it in his power to be whatever he would, and he may well be compared to the Proteus of fable. Now he spouts water; now he breathes forth flame. In the midst of the trivialities of his fashionable style, the giant spirit of his father may be discovered."

BACH, JOHANN CHRISTOPH, 1643–1703; eldest son of Heinrich, and one of the best organists and composers of his time. His compositions show "that he was truly a great man, as rich in invention as he was strong in the power of musical expression of emotion."

BACH, JOHANN CHRISTOPH FRIEDRICH, 1732–95; tenth son of Johann Sebastian, author of numerous compositions, ecclesiastical and secular. He was nearly all his life kapellmeister to the duke of Lippe Schaumburg.

BACH, JOHANN SEBASTIAN, a celebrated musician, b. at Eisenach, upper Saxony, in Mar., 1685. When he was ten years old, his father, who was a musician at Eisenach, died, and B. sought the protection of an elder brother, who dying soon after, he was again left destitute, and, to earn a livelihood, entered the choir of St. Michael's, Lüneburg, as a soprano singer. In 1703, he became court-musician at Weimar, and the following year, organist to a new church at Arnstadt. His reputation in this capacity soon spread, and in 1708 he was appointed court-organist at Weimar, by the reigning duke. While holding this office, he labored assiduously to make himself master of every branch of music. In 1717, he was made director of concerts, and six years afterwards, director of music, and cantor to St. Thomas's school, Leipsic, an appointment which he held to his death. About ten years later, the honorary distinctions of kapellmeister to the duke of Weissenfels, and court composer to the king of Poland, were conferred upon him. B., who had a son in the service of Frederick the great, received a pressing request to visit Potsdam on the occasion of a concert there. He went, and acquitted himself greatly to the satisfaction of that monarch, some of whose music he played at first sight. B.'s close studies affected his eyes, and an operation, designed to benefit them, left him totally blind, and hastened his death, which took place in July, 1750. With the exception of Handel, B. had no rival as an organist; and his compositions for the organ have a deservedly high reputation. They are too elaborate, however, ever to become very popular, though his fame as a composer is sure to advance with the progress of scientific musical culture. The highly educated musician will best appreciate the grandeur of some of his works. In 1850, a Bach society for the study and practice of his compositions was formed in London, and since that time they have often been publicly performed in this country. Three of his sons were also musicians of some note. One of them, Johann Christian, held the appointment of music-preceptor to queen Charlotte.

BACH, KARL PHILIPP EMANUEL, 1714–88; second son of Johann Sebastian. He was probably the most highly gifted of the eleven brothers, and his influence on the development of certain musical forms gives him a prominent place in the history of the art. He studied in the Thomas school, and afterwards in the university of Leipsic, where jurisprudence was his preference. In 1738, he went to Berlin, and soon afterwards was

appointed chamber-musician to Frederick the great. In 1767, he became kapellmeister at Hamburg, where he passed the remainder of his life. His most ambitious composition is the oratorio of *Israel in the Wilderness*. The greater portion of his numerous works was written for his favorite instrument, the clavier (the piano of that day). His essay on *The True Method of Harpsichord Playing* was long a standard work. Clementi professed to have derived from B. his distinctive style of piano-forte playing, and Haydn is said to have acknowledged his deep obligation to B.'s works. It was from these works that Haydn learned the form of the sonata and symphony, of which B. "may fairly claim to have been the originator, though Haydn enriched it and gave it permanence." As a psalm, ode, and song writer, B. surpassed his contemporaries, and gained great popularity. His idea of the purpose of music he explained by saying: "In my opinion the grand object of music is to touch the heart, and this end can never be obtained by mere noise, drumming, and arpeggios; at all events not by me."

BACH, VEIT, a German Protestant of Presburg, Hungary, by trade a baker; founder of the remarkable musical family of Bach.

BACH, WILHELM FRIEDMANN, 1710–84; eldest son of John Sebastian. He was a natural musician, nearly rivaling Mozart in precocity, and remarkable for extemporaneous composing. At Leipsic university he studied jurisprudence and mathematics; but music was not neglected. He was organist of St. Sophia's church, Dresden, and director and organist at Halle. Though acknowledged to possess the highest genius, he was so coarse, rude, and ill-tempered as to be unbearable. He was also strangely absent-minded, and a slave to drink.

BACH'ARACH, a small t. of Rhenish Prussia, romantically situated on the left bank of the Rhine, 22½ m. above Coblenz. It has a pop. of (1871) 1687, with a brisk trade and a good deal of commerce by river-craft. It is said to have derived its name from Bacchus (*Bacchi ara*), and the vine is still largely cultivated in the neighborhood—the wine produced being of a superior quality. B. is noteworthy also as the place where Blucher crossed the Rhine, on Jan. 1, 1814.

BACHE, ALEXANDER DALLAS, 1806–67, an American physicist; b. in Philadelphia. He was great-grandson of Benjamin Franklin; graduated at West Point, as lieutenant of engineers, in 1825, remaining some time in the academy as a teacher. He was employed under col. Totten on the fortifications at Newport, where he married Nancy Clarke Fowler. B. was professor of natural philosophy and chemistry in the university of Pennsylvania, and an early member of the Franklin institute, the journals of which gave an account of his scientific labors. In company with others he built an observatory in which, for the first time in the United States, the periods of the daily variations of the magnetic needle were fully determined, and other interesting observations made. In 1836, he became president of the trustees of Girard college, and visited Europe to examine educational systems for the information of the board, who were about to arrange the plan of the institution. His report in 1838 was of great value in suggesting improvements in our educational system. Before the college was organized, B. established a system of free education in Philadelphia, serving for a time gratuitously, at the same time assisting the British association in the examination of meteorological and magnetic phenomena. In 1842, he returned to his professorship in the university, and in 1843 was appointed successor to Hassler in the U. S. coast survey. This important service he reorganized and brought to its present recognized efficiency. He was also light-house commissioner, superintendent of weights and measures, regent of the Smithsonian institution, vice-president of the U. S. sanitary commission, received the degree of LL.D. from several colleges, medals from foreign governments and learned bodies, was president of the American philosophical society, president of the association for the advancement of science, and associate of many important scientific institutions at home and abroad. He gave $42,000 to the national academy of science for the promotion of its object. His important works are: *Observations at the Magnetic and Meteorological Observatory of Girard College*, reports on weights and measures, and various essays in the *Proceedings of the Association for the Advancement of Science*.

BACHE, BENJAMIN FRANKLIN, b. Va., 1801; great-grandson of Benjamin Franklin; graduated at Princeton, and in medicine at Pennsylvania university; assistant-surgeon in the army in 1824, and surgeon in 1828; professor of natural science and natural religion in Kenyon college; fleet surgeon of the Mediterranean squadron in 1841, and of the Brazil squadron in 1848. He established at New York the laboratory that supplied the medical department of the navy, and was director from 1855 to 1871, rendering important service to the union armies during the rebellion by supplying the laboratory from his own resources. In 1871, he was made medical director, with the rank of commodore.

BACHE, RICHARD, b. England, 1737; d. Penn., 1811; a Philadelphia merchant, son-in-law of Benjamin Franklin, and first U. S. postmaster-general.

BACHE, SARAH, only daughter of Benjamin Franklin, 1744–1808. During the revolution she was active in collecting clothing and money for the suffering patriot armies, at one time employing more than 2000 women and girls in making garments for sol-

diers. She also served in the hospitals, and was otherwise noted for patriotism and benevolence.

BACHELOR (Fr. *bachelier*, Lat. *baccalaureus*, or, as it is variously written in old documents, *baccalareus*, *bacularius*, and *bacillarius*). This word, which first makes its appearance in middle-age Latin, is of very uncertain etymology, and its primary meaning is consequently involved in obscurity. The usual derivation, from *bacca laurea*, a laurel berry, gives us little help; but the Spanish *bachiller*, which means at once *a babbler* and a master of arts, taken in conjunction with the Portuguese *bacharel* and *bacillo*, a shoot or twig of the vine (from the Latin *baculus* or *baculum*, a stick or shoot), and the French *bachelette*, a damsel, seem to point to its original and generic meaning, which probably was *a person shooting, or protruding from one stage of his career into another more advanced.* With this general signification, all the special meanings of the word given by Ducange seem to have some analogy. 1. It was used, he says, to indicate a person who cultivated certain portions of church-lands called *baccalaria*—which he supposes to have been a corruption of *vasseleria*—a feu belonging to an inferior vassal, or to one who had not attained to a full feudal recognition. 2. It indicated ecclesiastics of a lower dignity than the other members of a religious brotherhood—i.e., monks who were still in the first stages of monkhood. 3. It was used by later writers to indicate persons in the first or probationary stage of knighthood; i.e., not esquires simply, but knights who, from poverty and the insufficient number of their retainers—from their possessing, perhaps, only the *baccalaria* above referred to—or, from nonage, had not yet raised their banner in the field (*levé bannière*). 4. It was adopted to indicate the first grade or step in the career of university life. As an academical title, it was first introduced by pope Gregory IX. in the 13th c., into the university of Paris, to denote a candidate who had undergone his first academical trials, and was authorized to give lectures. but was not yet admitted to the rank of an independent master or doctor. At a later period it was introduced into the other faculties as the lowest academical honor, and adopted by the other universities of Europe. See DEGREES, UNIVERSITY. 5. It came to be used in its popular meaning of an unmarried man, who was thus regarded as a candidate or probationer for matrimony.

The legislation of almost every country, at some period of its history, has imposed penalties on male celibates or bachelors, on the principle that every citizen is bound to rear up legitimate children to the state. By the Jews, the command, "Be fruitful and multiply," was interpreted strictly, and every Hebrew regarded marriage as a duty. In Sparta, where the interests of the individual were entirely sunk in those of the state, criminal proceedings were authorized by the laws of Lycurgus not only against those who neglected to marry, but against those who, from marrying late in life, or any other cause, formed such alliances as rendered the procreation of healthy children unlikely. By the laws of Solon, celibacy was also treated as a crime, though the practice of interfering with the feelings of the individual in this respect early fell into desuetude at Athens. At Rome, penalties and disabilities were imposed on unmarried men from an early period, and latterly on unmarried women also. In the allotment of the Campanian lands, Julius Cæsar gave portions only to those who had three or more children; and in later times we have the *jus trium* (*quatuor et quinque*) *liberorum*. The most important provisions on this subject are contained in the law (or rather the laws, for it consisted of an act and an amended act) called Lex Julia et papia poppæa, the first portion of which belongs probably to 18 B.C., and the second portion to 9 A.D. In addition to various other provisions regarding marriage, this law imposed penalties on those who lived in a state of celibacy after a certain age. No unmarried person could take a legacy, whether of a portion or of the whole possessions of a deceased person, unless he complied with the law—i.e., got married within 100 days from the testator's death. Widows were at first allowed 1 year from their husbands' death, and divorced women 6 months from the time of the divorce, before they came within the penalties of the law; and these periods were afterwards extended to 2 years, and 1 year and 6 months respectively. The original provisions of the law did not apply to men beyond 60, or women above 50, but they were extended to them by subsequent enactments, and made perpetual even in case of their marrying. The *senatûs consultum* passed in the time of Claudius, however, again exempted men above 60 who married wives under 50, as from their unions it was supposed there was a fair prospect of issue. Childless married persons, moreover, from the ages of 25 to 60 in males, and 20 to 50 in females, were subject to the penalties of the *lex*, to the extent of losing one-half of any inheritance or legacy which might be bequeathed to them. The lex papia also contained a provision by which a candidate who had several children was preferred to one who had fewer; and various other premiums on fruitfulness were held out both at Rome and in the provinces.

In Britain, there are numerous instances of additional or higher taxes being imposed on bachelors and widowers, but apparently more with a view to the revenue than with any other object. Of this 6 and 7 Will. III. c. 6, which was passed in 1695, and which granted to his majesty certain rates and duties upon marriages, births, and burials, and upon bachelors and widowers for five years, "for carrying on the war against France with vigor," is an instance; and another, probably, may be found in the higher charge

for the servants of bachelors, first imposed by Mr. Pitt in 1785, and continued for a considerable time. By 52 George III. c. 93, unmarried daughters of persons alive were exempted from the tax upon hair-powder; and in the income-tax of 1798, deductions were made on account of children, 5 per cent being allowed to a person who had a family, and whose income was above £60, and under £400 a year, corresponding deductions being made in other cases. Much might be said in favor of such distinctions, on the ground of expediency, as they enable the government to impose a higher taxation, by lessening the burden on those members of the community who are most likely to complain; but their recognition in practice would, no doubt, be regarded as impossible by the financiers of our day, who have hitherto failed to distinguish between income derived from realized property and from personal labor.

BACHELOR, KNIGHT (qu. *bas chevalier*), the lowest grade of knighthood, now only conferred in the United Kingdom. Originally, like all knighthood, a military distinction, knighthood of this description came to be often bestowed on civilians, and in recent times it has frequently been conferred for no weightier service than carrying a congratulatory address to court. It is generally conferred by the sovereign by a verbal declaration accompanied with the imposition of the sword, and without any patent or instrument. The person who is to receive the honor kneels down before the sovereign, who touches him on the shoulder with a naked sword, saying, in French, "*Sois chevalier au nom de Dieu*" (Be a knight in God's name), and then adds: "Rise, Sir A. B." In exceptional cases, persons have been made knights bachelor by patent. The lord-lieutenant of Ireland occasionally exercises a right of conferring knighthood. See KNIGHT.

BACHIAN, one of the Molucca islands just s. of the equator, 127° e. It has about 800 sq.m.; is of irregular form, and mountainous. Hot sulphur springs bespeak volcanic action. The island is well wooded, and sago, cocoa nuts, and cloves are abundant. There is one large grove of nutmeg trees. It is the most eastern point on the globe inhabited by any of the quadrumana. The people are the Sirani, or Christian descendants of the Portuguese, some Malays, a few Papuans, and a colony from the Celebes. The government is headed by a sultan under the protection of the Dutch. The chief town is called Amassing by the natives.

BACHMAN, JOHN, b. New York, 1790; naturalist and Lutheran minister, pastor in Charleston, S. C., in 1822. He was assistant to Audubon, and chief author of the work on North American quadrupeds. Among his own works are: *A Defense of Luther*, and *Characteristics of Species and Genera as Applicable to the Doctrine of the Unity of the Human Race.*

BACIOCCHI, MARIE-ANNE-ELISA BONAPARTE, the eldest sister of Napoleon Bonaparte, was b. at Ajaccio, Corsica, in 1777. When that island was occupied by the English, she, with her family, emigrated to Marseille. Here she married, at the age of 20, a countryman of her own, capt. Bacciocchi. The elevation of Napoleon raised her also to rank and power; and in 1806, the principality of Massa and Carrara was intrusted to her administration, which was, on the whole, a beneficial one for the people. In 1809, she was made grand duchess of Tuscany, and appointed as administrator over that country in Napoleon's name. Here the arbitrary measures of her brother, which she had to carry out, and her own self-will and harshness, rendered her anything but popular. Her husband took no part in the government. When the allies entered Tuscany in 1814, she of course had to leave Florence. She died, at Bologna, of nervous fever, in 1820.

BACK, in maritime language, has many technical applications. To *back an anchor*, is to support the large anchor by a smaller one, in order to prevent it from loosening and coming home in bad ground. To *back and fill*, is a mode of tacking when the tide is with a vessel, but the wind against her. To *back the sails*, is so to arrange them as to make the ship move astern or backwards; it is done when the tide or current is with the ship, and light winds against her; and the maneuver is useful to avoid collisions in narrow channels, to bring the ship into a particular position during naval engagements, or to keep ships well asunder when crowded in convoy. To *back the maintopsail*, and analogous operations to other sails, is so to arrange a sail that the speed of the ship's progress may be checked.

BACK, Sir GEORGE, a well-known traveler in the polar regions, was b. at Stockport in 1796. He entered early on a naval career, and accompanied Franklin and Richardson in their expedition to the n. coast of America. He volunteered to the government to go in search of capt. Ross, who was supposed to have been lost in his attempt to discover the north-west passage; and his offer having been accepted, he left London, Feb. 17, 1833, and on the 28th of June, started from Norwayhouse, a station of the Hudson Bay Company, on his journey to the north. After passing a terrible winter with his companions at Slave lake, he discovered, in 1834, Artillery lake, and the Great Fish river, or Back's river, which he followed to the Frozen ocean. Being hindered by the ice from preceding along the coast as far as cape Turn-again, he returned by the river; but although he had received news of the return of capt. Ross, he continued his explorations in the North sea, and did not return to England until 1835, when he was raised to the

rank of post-captain for his services. In 1836 and 1837, he further explored the arctic shores in the interests of geography—the geographical society, in the latter year, bestowing its gold medal upon him. Two years afterwards, he was knighted, and had a lucrative treasury appointment bestowed upon him. He attained flag rank in 1857, and that of admiral in 1867. He d. in June, 1878.

BACKERGUN'GE, a t. of Bengal, situated on B. creek, an offset from the Ganges, in lat. 22° 43′ N., and long. 90° 22′ E.—125 m. to the E. of Calcutta. Till supplanted by Burrisol, which is 12 m. to the N., it was the capital of the district of the same name.

BACKERGUN'GE, the district named from the foregoing town. It extends in N. lat. from 22° 2′ to 23° 13′, and in E. long. from 89° 49′ to 91°, containing 4935 sq.m., and (1871) 2,377,433 inhabitants, or about 480 inhabitants to a sq.m. Like the rest of the great delta of Bengal, B. is of alluvial formation and level surface, being watered at once by the lower streams of the Ganges and the Brahmaputra, and also by the various branches or offsets which interlace together those mighty rivers. In consequence of the great number of water-courses, which at once cool the atmosphere and drain the soil, the country is fertile, and the temperature is said never to rise above 88° in the shade. From the same cause, the district is independent of regular roads for intercourse and communication. In the season of high-water, as may be expected, inundations are common. To guard against them, the houses are built on mounds; while the corresponding excavations, like the natural "water-holes" of Australia, serve as tanks against the effects of the dry season. As is often the case in alluvial regions, land-slips are frequent, and also the opening of new channels for the streams. The productions are rice, sugar, cotton, pulse, mustard, cocoa-nut, betel-nut, mango, guava, plantains, limes, pine-apple, ginger, and turmeric. Buffaloes are said to be generally used instead of oxen, of which the domestic breed is small and poor.

BACKGAMMON is the modern name of a game of considerable antiquity in England, where it was formerly known by the appellation of "the tables." The words *backgammon* have been ascribed to the Welsh tongue, in which they are said to signify *little battle;* but Strutt, with greater plausibility, traces the term to the Saxon "*bac* and *gamen* —that is, back-game—so denominated because the performance consists in the two players bringing their men back from their antagonist's tables into their own; or because the pieces are sometimes taken up and obliged to go back—that is, re-enter at the table they came from." Whatever be the etymology of the term, the game has been long established in the country; and as a fireside amusement of a decorous nature, is a favorite among clergymen, squires, farmers, and retired professional persons.

B. is played with an apparatus consisting of a board or tables, men or pieces, dice, and dice-boxes. The introduction of dice into the game, and their constant use in determining moves, makes B. essentially a game of chance, and therefore brings two players of unequal talents nearer a level than other diversions in which skill is the sole or predominant element. The B. board consists of two parts or tables, generally united by a hinge in the middle, by which they can be shut up as a box. Each table possesses twelve points, six at each end. These points are colored white and black alternately; but this variation of color has no reference to the game, and is only done to make the points more easily counted. The game is played by two parties, and with 30 pieces or men; each party has 15 men, one set of 15 being black, and the other white. In beginning the game, the men are placed on certain points on the tables, as shown in the following figure. The game is played with two dice and two dice-boxes. The dice are common to both; but each party uses his own dice-box, and the throws are alternate. Each die is a perfect cube, marked on its sides with dots from 1 to 6. The 1 is called *ace;* the 2, *deuce;* the 3, *tre* or *trois;* the 4, *quatre;* the 5, *cinque;* and the 6, *size.* At every throw, the two dice are employed; consequently, a person may throw from 2 up to 12—that is, two *aces* up to two *sizes.* If a player throw *doublets,* or both dice of one number, double the number of dots is reckoned; thus, by a throw of two aces, the player does not count 2, but 4. These numbers thrown or accidentally turned up by the dice, bear a reference to the points on the tables. In order to understand this connection between the dice and the men, the learner must observe how the men are placed on the points, and the rules by which their shifting from one to another is governed.

The tables are here spread out as if two partners were seated, and about to begin to play. The party owning the white men is seated at W, and the party owning the black men at B. We shall call one party White, and another Black. White counts round from the ace-point of Black, and Black counts round from the ace-point of White. These ace-points are respectively seen to have two men upon them in opposite corners of the same table. The grand object of the game is for each party to get all his men played round into the table containing the aces, removing them from point to point agreeable to the throws of the dice. In throwing, the number upon each die turned up may be reckoned by itself, or collectively, with the number on the other die. Thus, if quatre be thrown by one die, and size by the other, a man can be advanced 4 points, and another 6 points; or one man can be advanced 10 points, always providing that a point is open to suit this movement to it. No point can be moved to if covered by two men belonging to the adversary. If covered by only one man, which is called a *blot,* then that man can be hit, and be removed from the point, and placed on the bar between the tables, his

place being taken by the man who has won it. The removal of a man to the bars throws a player considerably behind in the game, because the man must remain out of the play till the dice turn up a number corresponding to one open point on the adversary's table. Being fortunate to get an open point by this means, the man must be entered and wrought round from thence, as in the case of others in the set to which he belongs. The frequent occurrence of this hitting of a blot gives an adversary a great advantage, and allows him to win the gammon. There are two kinds of victory,—winning the hit, and winning the gammon. The party who has played all his men round into his own table, and by fortunate throws of the dice has borne or played the men off the points first, wins the *hit*. The gammon may be explained as follows: When you have got all your men round to your own table, covering every point, and your adversary has a man out, then you are enabled to *bear* or lift your men away. If you can bear all away, so as to clear your table before the adversary gets his man placed by a throw on your table, you win the gammon. If the adversary has been able to bear one before you have borne all your men, it reduces the victory to a hit. Two hits are reckoned equal to one gammon in playing matches. To win two games out of three is called winning the *rub*, as at whist.

BACKHUYSEN, LUDOLPH, one of the most famous painters of the Dutch school, a master in marine painting, was b. at Emden in 1631. His parents intended him for a commercial career; but he had not been long in a mercantile office in Amsterdam, to which he had been sent at the age of 18, before he resolved to devote himself to painting, and with that object received instruction from Evendingen, and attained, in a short time, extraordinary skill and readiness in execution. He was a close student of nature; so much so, that on the approach of a storm he often put to sea in a boat, in order to watch and sketch its effects, which he transferred to canvas immediately on his return home. His most famous picture is the sea-piece in the gallery at Paris, which he was commissioned to paint by the magistrates of Amsterdam, and which was, in 1665, sent as a present to Louis XIV. In all his pictures, the utmost truthfulness prevails, at the same time that they embody all the poetry of the sea. His coloring is also excellent. After he was 71 years old, he began etching on copper. He also made attempts in poetry, and gave lessons in writing, an art which he did much to promote. He d., after long illness, in 1709.

BACK-STAYS are long ropes which extend from the topmast-heads down to the sides of a ship, where they are fastened in such a way as to assist the shrouds in supporting the masts. Different kinds are distinguished as *after-B.*, *breast-B.*, and *traveling-stays*. One rope generally forms a pair of B.; being looped in the middle to pass over the mast-head.

BACKUS, CHARLES, D.D., 1749–1803; a native of Connecticut, a graduate of Yale, and Congregational pastor in Somers, Conn. He was for many years a teacher of theology, and had the training of such men as Dr. Woods of Andover, president Moore of Amherst, and president Davis of Hamilton college.

BACKUS, ISAAC, 1724–1806; a native of Connecticut. He left the Congregationalists for the Separatists, or New Lights, and these sympathized closely with the Baptists, of whom B. became a leader, and by his own exertions largely increased the prosperity of the denomination. He was a strong advocate of the entire separation of church and state, and went before the continental congress in 1774 to ask for the Baptists the same privileges that were granted to other sects. His principal work is a history of New England with particular reference to the Baptists. This history he abridged, and brought down to 1804.

BACOLOR', a t. of the island of Luzon, Philippines, the capital of the province of Pampanga, 38 m. n.w. from Manila. Pop. 8737. It stands in a plain, near the river Pampanga, with which it is connected by a canal.

BACON (from a root in the Teutonic languages which seems to be allied to the Lat. *vacca* [in mid. Lat. *baca*], a cow, and to have signified an animal in general; *bache*, in Ger., signifies among hunters a wild sow; *bake*, in Dutch, a swine in general) is the cured sides of a pig; while bacon-hams are the hind-legs cured. The mode of curing will be described under HAMS; and their properties as articles of food, under PORK.

BACON, ANNE, 1528–1600; wife of sir Nicholas B., second daughter of sir Anthony Cooke, sister of the wives of lord Burleigh, sir Henry Killigrew, and sir John Russell, and mother of lord Bacon. Her father, from whom she acquired a superior education, was tutor of Edward VI.

BACON, DELIA, 1811–59; sister of Leonard, eminent as a teacher; author of *Tales of the Puritans*, *The Bride of Fort Edward*, and *Philosophy of the Plays of Shakespeare Unfolded*, in which she endeavors to prove that lord Bacon was the real author of the Shakespearean plays.

BACON, FRANCIS, Lord VERULAM, Viscount ST. ALBANS, b. in London, Jan. 22, 1561, was the son of Sir Nicholas Bacon (q.v.). His mother was the learned Anne Cooke. In early childhood, he manifested superior powers, and an ardent love of knowledge; his intelligence was so precocious, and his sedateness so remarkable, that the queen took

pleasure in calling him her "young lord keeper." At the age of 13, he was sent to the university of Cambridge, which he quitted, after a residence of three years, with a low opinion of the course of study pursued there, and, as well, of the Aristotelian philosophy. On leaving the university, he went to Paris, in the suite of Sir Amias Paulet, the English ambassador, and there occupied himself chiefly with statistics and diplomacy, the result of his studies and observation being a work, afterwards published, *Of the State of Europe*. The sudden death of his father, about the end of 1579, recalled him in 1580 to England, where, after failing to procure from the government a provision which would enable him to devote himself to science and literature, he betook himself for several years to the study of law. His professional progress was at first very slow, and, contrary to what might have been expected, it was long before he could obtain promotion in the public service. This want of success was chiefly owing to the hostility of his uncle, the queen's first minister, lord Burleigh (see CECIL), who regarded him as a dangerous rival to his own son. To lord Burleigh and his son, B., in the hope of advancement, had paid court till it was clear no favor was to be expected from them, when he betook himself to their rival, the earl of Essex, whose friendship he speedily won. But the earl's influence could not counteract the continued opposition of the Cecils, through whom he was defeated, in 1594, in an attempt to obtain for B. the then vacant office of attorney-general. What he could do for his friend, however, he did; for shortly after this disappointment he presented him with an estate at Twickenham worth £2000 a year. It is painful to relate that B. repaid the generous friendship of his patron with flagrant ingratitude. When Essex was subsequently brought to trial for a conspiracy against the queen, B. came forward as his accuser with tongue and pen; he unnecessarily appeared as counsel against the friend who had so largely obliged and confided in him, and used all his great talents and ingenuity as a pleader to magnify his crimes and secure their punishment. B. was straitened at the time in his circumstances, through his extravagant mode of life, and, moreover, was anxious to conciliate the court, whose anger he had provoked by having espoused the popular cause on his first entering parliament as member for Middlesex in 1595. But whatever the temptation was, it cannot affect our opinion of conduct so mean and immoral. It remains to be stated, that, after the earl's execution, he wrote, at the request of the queen, *A Declaration of the Practices and Treasons Attempted and Committed by Robert Earl of Essex*, which was printed by authority.

In 1590, B. obtained the post of counsel extraordinary to the queen, and a few years afterwards he entered parliament as member for Middlesex. It was not, however, till the reign of James I. that he made rapid progress. He was knighted in 1603, and in the following year was appointed salaried counsel to the crown; by 1613, he had advanced to the office of attorney-general, in which he unconditionally subserved the purposes of the court. His conduct as attorney, in attempting to extort by the rack a confession of treason from an old clergyman of the name of Peacham, has met with universal and deserved condemnation. He did not, however, cringe to the king and the royal favorite, Villiers, except to good purpose. In 1617, he was appointed keeper of the great seal, and in 1619 attained the dignity of the lord chancellorship, with the title of lord Verulam. In the year following, he was created viscount St. Albans.

Having attained the highest honors of the state by truckling to the king and his favorite, B. proceeded to abuse his judicial functions to increase his revenues, which, great as they were, were unequal to his extravagance. Though his official income was great, and his means had been enlarged by a marriage with the daughter of a wealthy alderman, he could only support his style of life by contracting debt and accepting bribes from suitors. Nor was money his only motive to false judgments; he more than once polluted the stream of justice, to maintain the favor of Buckingham. By 1621, the state of the courts had become so scandalous as to call for a parliamentary inquiry, which resulted in his being convicted, on his own written confession, of twenty-three acts of corruption. In consequence, he was condemned to pay a fine of £110,000, and to be confined in the Tower during the king's pleasure; he was banished for life from the court, and declared unfit to hold any office of state, or to sit in parliament. The fine, however, was remitted; the imprisonment lasted only two days; he was allowed again to appear at court, and, indeed, was summoned to sit in the very next parliament. Age, however, failing health, and perhaps shame, prevented him from appearing. Banished from public life, he henceforth devoted himself to literature and science, enjoying from the government a pension of £1200, and an annual income, in all, of £2500. His mode of life still, however, continued to be so prodigal and ostentatious that, at his death, in 1626, his debts amounted to upwards of £22,000. The immediate occasion of his death (as related by Aubrey, who probably got it from Hobbes, who was B.'s intimate friend) was cold caught in making an experiment to test the power of snow to preserve flesh. He died in the house of the earl of Arundel, to which he had been removed with the fatal chill upon him which he had caught in the course of the experiment.

While, on the whole, the public life of lord B. is marked by meanness and dishonor, his literary and scientific works are everywhere irradiated by the powerful light of an intellect which towered over those of other men. The first edition of his *Essays* appeared in 1597; his two books of the *Advancement of Learning* in 1605; his *Wisdom of the Ancients*—in Latin—in 1610; a third edition of his *Essays*, greatly extended, in 1612; his two books of the *Novum Organum*, or second part of the *Instauratio Magna*,

designed to consist of six parts—also in Latin—in 1620; his *History of the Reign of Henry VII.*, in 1622; his nine books, *De Augmentis Scientiarum*—a Latin translation and extension of his *Advancement of Learning*—in 1623. Besides these, he wrote several minor works, which need not here be specially mentioned. It is enough to say that his writings embrace almost all subjects, from jurisprudence—which he treated not as a mere lawyer, but as a legislator and philosopher—to morality and medicine. The *Sermones Fideles* is a treasury of the deepest knowledge of human relations, conveyed in a gorgeous and energetic style. Almost the only science with which he was unacquainted was that of mathematics. Thus singularly gifted and accomplished, he appeared at a time when science, from a variety of causes, started on that progress which has never since been arrested. If it is now a question how far he contributed by his genius to that progress at its commencement, it is a fact that he was long vulgarly regarded by his countrymen as the father of inductive philosophy—as having been the inventor and first teacher of the method of interrogating nature by observation and experiment and inductive reasoning. Nor are his writings wanting in materials qualified *ex facie* to support his title to that eminence. His claim to the distinction, however, has of late been the subject of much controversy, the result of which is that it has been generally disallowed. But if it be true that he had a somewhat vague and imperfect apprehension of the philosophy of induction, overestimated the province of observation, and undervalued the use of deduction and hypothesis, and that even his classification of the sciences in the *De Augmentis*, on which his reputation long turned, has been properly superseded by the superior and better-reasoned classification of M. Comte; still it must be borne in mind that he was one of the first that was aware of the true character of the positive philosophy, and who understood its conditions, and foresaw its final supremacy; and as for his classification, that it was a marvelous effort of reason at a time when the sciences were in their infancy, and many of them were yet unborn. Also, it must be said, that if B. cannot be claimed by the physicists as the father of their science, and they must look rather to Galileo, yet he may fairly be claimed in that character by the students of man and society; for he was the first to aim at the extension of the methods of positive philosophy to moral and social conceptions. If recent criticisms have dethroned him from the position which for centuries he occupied in relation to the physical sciences, by showing that neither his doctrines, experiments, nor writings have materially affected their course, it is only to leave him free to be placed in a position no less dignified in relation to human and social philosophy.

As a writer, B. presents us in combination an intellect at once one of the most capacious and profound that ever appeared among men—one of the most penetrating, one of the most far-reaching—and an imagination almost equally remarkable. In no other writer is so much profound thought to be found expressed in such splendid eloquence. "If," says Hallam (*Literature of Europe*, iii. 218), "we compare what may be found in the sixth, seventh, and eighth books *De Augmentis*, in the *Essays*, the *History of Henry VII.*, and the various short treatises contained in his works on moral and political wisdom and on human nature, from experience of which all such wisdom is drawn, with the rhetoric, ethics, and politics of Aristotle, or with the historians most celebrated for their deep insight into civil society and human character—with Thucydides, Tacitus, Philip de Comines, Machiavel, Davila, Hume—we shall, I think, find that one man may almost be compared with all of these together."

The collected works and life of lord B. were published by Mallet in 5 vols. (Lond. 1765); a good edition is that of Montague (16 vols., Lond. 1825–34); but the best, it is generally admitted, is the last (Works, 7 vols., edited by Spedding, Ellis, and Heath, 1858–59; *Letters and Life*, 7 vols., by Spedding, 1862–74). An able review of B.'s character is to be found among Macaulay's *Essays*. The *Encyclopædias Britannica* and *Metropolitana* contain valuable papers on his writings, on which also sir J. Herschel's *Preliminary Discourse* in *Lardner's Encyclopædia* may be consulted.

BACON, JOHN, a distinguished statuary, was b. in London, 1740, and d. there Aug. 7, 1799. He was at first a painter on porcelain, and only began to work in marble at the age of 23; yet in 1769 he received the first prize from the royal academy, of which he was soon after made a member. His statue of Mars first established his fame. Among his principal works are, two busts of George III., one in Christ Church college at Oxford, the other in the university library at Göttingen; the monuments of lord Chatham in Westminster abbey and in Guildhall; the statues of Howard and of Samuel Johnson in St. Paul's, and that of Blackstone at Oxford. B. was deficient in imagination, and had no refined perception of beauty.

BACON, LEONARD, D.D., LL.D., b. Michigan, 1802; son of a Congregational home missionary from New England; graduated at Yale in 1820, and at Andover in 1824; the next year, and until 1866, pastor of the First church in New Haven; acting professor of revealed theology in Yale from 1866 to 1871, and since then lecturer on ecclesiastical polity and American church history. He was one of the editors of the *Christian Spectator*, and is still an editor of the *New Englander*, of which he was one of the founders. He was also for 15 years one of the editors of the *Independent*. Dr. B. is the author of *Select Practical Writings of Richard Baxter, with a Life of the Author; Manual for Young*

Church Members, Slavery Discussed, and various historical discourses and essays. As a thinker and writer he is noted for breadth and vigor.

BACON, LEONARD WOOLSEY, D.D., b. New Haven, Conn., 1830; a writer and theologian, son of Leonard B., graduated at Yale, 1850. After officiating as a clergyman in various places, he was pastor, for longer or shorter terms, of the First church, Litchfield, Conn., of the New England Congregational church, Brooklyn, and of the First church, Stamford, Conn.; subsequently passed several years in Europe, chiefly in Geneva, as student, preacher, and writer; now pastor of the Park Congregational church, Norwich, Conn.

BACON, NATHANIEL, b. England, 1630-40; d. Va., 1677; a lawyer and member of governor Berkeley's council, leader of an alleged insurrection against the colonial government under pretense of resisting aggressions of the Indians. Berkeley was forced to make many concessions to demands for better government; but he broke his promises, and a brief civil war followed, in which Jamestown was burned (1676), and the governor took shelter in an English vessel. Before Bacon completed plans for re-establishing the government, he died from disease taken in an Indian campaign, and the rebellion soon came to an end.

BACON, Sir NICHOLAS, the father of lord Bacon, was b. in 1510, at Chiselhurst, in Kent. He received an excellent education; and being gifted by nature with sound and practical abilities, he quickly prospered in the legal profession, to which he attached himself. At the age of 27, he was appointed solicitor to the court of augmentations; two years later, on the dissolution of the monasteries by Henry VIII., he had the courage to present to that irascible monarch a reasonable project for applying the wealth which had been "rescued" from the church. It was this: that Henry should employ a portion of it in founding a college for the study of politics and diplomacy. Unfortunately, the king had already squandered it away in presents, and was unable to comply with the wise suggestion of the young lawyer; but probably he remembered his good sense, for, in 1546, Henry advanced him to the office of attorney of the court of wards, which he retained during the reign of Edward VI.; but his Protestantism necessarily caused him to be deprived of all public honors and emoluments after the subsequent Catholic succession. On the death of Mary, however, he was made a member of the Protestant part of the privy council, by queen Elizabeth; and in 1558, received at her hands the great seal. In the beginning of 1559, he opened parliament with a judicious speech on the difficult subject of a national religion. He was also president of that assembly of ecclesiastical disputants which met in Westminster two months later, to discuss the points of controversy between Protestants and Catholics. In 1564, he suffered a temporary eclipse of royal favor, on account of the too patriotic character of his religion; but through the persevering efforts of his old and constant friend, sir William Cecil, he was at length restored to the sunshine in which he had been accustomed to bask. Elizabeth even went the length of paying him a visit in 1577, at his magnificent mansion of Gorhambury, in Hertfordshire. He died on the 20th of Feb., 1579. Sir Nicholas was one of those solid and stately Englishmen to whose sagacity, high principle, and firm demeanor his country owed its safety in that critical period when Elizabeth mounted the throne.

BACON, ROGER, an English monk, who, through the force of his intellect, raised himself far above his age, made wonderful discoveries in several sciences, and contributed much to extend the then scanty knowledge of nature. He was descended of a respectable family, and b. at Ilchester, in the co of Somerset, 1214. He studied at Oxford, and then at Paris, where he received the degree of doctor in theology; and soon after his return home, he entered the order of the Franciscans, and settled at Oxford. Physics seems to have been at that time the chief object of his labors; and liberal friends of science supplied him with the means of pursuing his researches. In exploring the secrets of nature, he made discoveries and invented applications which were looked upon by the ignorant as the work of hellish magic. This prejudice was encouraged by the jealousy and hate with which his brother monks regarded his superiority. Besides, he loudly denounced the ignorance and immorality of the clergy, especially of the monks, and even wrote a letter to the pope, in which he represented to him the necessity of clerical reform. Out of revenge, an accusation was brought against him at the papal court, and the pope interdicted him from teaching in the university. He was shortly after imprisoned, forbidden all human intercourse, and hardly allowed sufficient food. Among the few clear-sighted men who admired Bacon's genius, and pitied his misfortunes, was the cardinal-bishop of Sabina, at that time papal legate in England. He desired to see Bacon's writings, but the interdiction of the Franciscans prevented a compliance with his wish. On his ascent to the papal throne as Clement IV., B. wrote to him, expressing his readiness to furnish him with whatever he desired, and Clement in reply repeated his request to see B.'s works, in defiance of the Franciscan prohibition. B. accordingly drew up his *Opus Majus* (edited by Jebb, 1733), which he sent, along with two other works, it is said, to the pope, by his favorite pupil, John of London, and in which he represented the necessity of a reformation in the sciences through a diligent study of the languages and of nature. How Clement received them is not very well known; but they could only have reached him about the time he was seized with his last

illness. For 10 years after Clement's death, B. was free from open persecution at least. But in 1278, under Nicolas III., the general of the Franciscan order, Jerome of Esculo, declared himself against B., forbade the reading of his books, and issued an order for his imprisonment, which was sanctioned by the pope. This new imprisonment lasted 10 years. When Jerome of Esculo became pope, under the name of Nicolas IV., B. sent him a *Treatise on the Means of warding off the Infirmities of Old Age* (Lat. Oxf. 1590; Eng., by Brown, 1683), with a view to convince him of the harmlessness and utility of his labors, but in vain. What the pope refused to the representations of the old philosopher, was yielded to the intercession of several influential English noblemen, and B. at last recovered his freedom. He returned to Oxford, wrote a compendium of theology, and shortly after died—according to some, in 1292, to others, in 1294.

B., although an extraordinary genius, could not rid himself of all the prejudices of his times. He believed in the philosopher's stone and in astrology. His chief invention is the magnifying-glass. There are also in his writings other new and ingenious views on optics; for example, on refraction, on the apparent magnitude of objects, on the great increase in the size of the sun and moon in the horizon. On other subjects, again, he fell into the greatest errors. He made several chemical discoveries which were wonders at that time. He knew, for instance, that with sulphur, saltpetre, and charcoal, we may imitate lightning, and produce explosions. Mathematics, applied to observation, he considered to be the only means of arriving at a knowledge of nature. He studied several languages, and wrote Latin with great elegance and clearness. Deserving of honorable mention are his discoveries of the errors that prevailed in the calendar, and his proposals and data for remedying them, in which he came very near the truth. He prepared a rectified calendar, of which a copy is preserved in the Oxford library. On account of his extensive knowledge, he received the name of "doctor mirabilis." Several of his works have never been printed, and are preserved among the Cottonian manuscripts in the British museum; some are to be found in French libraries.

BACON BEETLE. See DERMESTES.

BACS, or BACSKA, a co. in Hungary between the Danube and the Theiss, 3973 sq.m.; level and very fertile. Its products are wheat, wine, tobacco, horses, and cattle. A canal connecting the two rivers goes through the county. The chief towns are Zombor, the capital, Maria-Theresiopel, and Neusatz. The town of Bacs is on an affluent of the Danube; pop. '70, 3666.

BACSAN'YI, JANOS (pronounced Bat-shan-yi), a Hungarian writer and poet, was b. May 11, 1763, at Tapolcza, in the circle of Szalader. After studying at Vessprim, Oedenburg, and Pesth, he became tutor to the son of gen. Orczy, and while thus employed, published his first work, *The Valor of the Magyars* (Pesth, 1785). He received the same year an appointment in the finance department of Kaschau, and there, in conjunction with Baroti and Pazinczy, he began the *Magyar Museum* (Kaschau and Pesth, 1788–92). In 1793, in consequence of a liberal poem, he was deprived of his office, and in 1794, having taken part in the conspiracy of bishop Martinovich, he was carried to Spielberg, where he was confined till 1796. After recovering his freedom, he assisted in editing the *Magyar Minerva*, then came to Vienna, where he held an office in the bank, and married (1805) the German poetess, Gabrielle Baumgarten—an unhappy match. When the French entered Vienna in 1809, B. translated Napoleon's proclamation to the Hungarians, on which account he found himself afterwards obliged to take refuge in Paris. After the peace of Paris, he was given up, and had Linz assigned him as a compulsory residence, but was allowed to receive his French pension till his death. He died at Linz, May 12, 1845; the Hungarian academy had in 1843 again elected the octogenarian a corresponding member. In the latter part of his life, B., besides other works, published his *Collected Poems* (Pesth, 1827; Ofen, 1835). We are also indebted to him for the collected edition of the poetical works of Anyos (Vienna, 1798), and of Faludi (Pesth, 1824).

BACTE'RIUM, a minute and low form of vegetable organism, refractive, spherical, and mobile. It occurs as a fossil; is found in the sap of plants; in the fluids of men, animals, insects, larvæ and imagines, and eggs; is abundant in incipient stages of fermentation and decay of animal and vegetable tissues and substances. Bacteria act as a ferment, changing cane sugar and starch to glucose. They are communicated as germs floating in the air; they assist in the ripening of fruit, and in the regeneration of organic matter, during the formation of cell structure. They thrive equally well in acid, alkaline, or neutral fluids. Many phenomena, otherwise attributed to spontaneous generation, are caused by these minute and omnipresent organisms. Indeed, the difficulty attending most experiments concerning spontaneous generation lies in the uncertainty of removing such germs from an inclosed space, of killing such as remain, and preventing the ingress of others.

BACTRIA, the ancient name of the imperfectly known land lying between the western part of the Hindu Kush mountains, and the river Oxus (Amu, or Gihon), which separated it from Sogdiana on the n. and n.e. Its boundaries in early times cannot be precisely ascertained, but it is generally considered to have been identical with the modern Balkh (q.v.). B. is supposed to have been the seat of the parent-people

from which the Aryan (q.v.) or Indo-European family of nations branched off. The ancient Bactrians of historic times were akin to the Medes and Persians, and used the Zend language. B. was originally the center of a powerful kingdom, which extended itself over the e. of Persia, but we have almost no record of its early greatness; we only know that Ninus, the Assyrian king, in spite of his vast army, found much difficulty in conquering it, and that when Arbaces besieged the last Assyrian king, Sardanapalus, in his metropolis, he was assisted by a large force of Bactrians. It is believed that the ancient Persian religion was first developed in Bactra or Zariaspa, the capital of B., which was the head-quarters of the Magi till the land was overrun by the Arabs, and a center-point of the inland trade of Asia. The modern town of Balkh (q.v.) is built upon its site. Alexander, on his return from Persia, left in B. a colony of 14,000 Greeks, who here extended civilization. After the death of Alexander, B. was annexed to the kingdom of Syria; but was raised to independence by its governor, Diodotus I., who founded the Greek kingdom of new B. about 256 B.C. The history of this kingdom was formerly little known, but has been recently elucidated by numerous Græco-Bactrian coins found in the *topes* or burial-places of Afghanistan. These coins give the names of a series of kings, and bear indications of the political circumstances of the Greek kingdom of B. On those of Eucratides, a monarch who flourished in the age of Mithridates, there are found, beside the Greek characters, others which have been proved to belong to a dialect of the Sanscrit, and have been very happily deciphered by Mr. Prinsep.

BAC'TRIS, a genus of palms, of which nearly fifty species are known, all American. The leaves of some are pinnate, those of others entire. They are generally small palms, some of them very small, and with slender stems; that of *B. tenuis* is not thicker than a goose-quill. Some are spiny, and form thickets not easily traversed. *B. acanthocarpa* is called TUCUM, near Bahia, and from it an extremely tough thread is obtained, which is used for making nets. *B. maraja*, the MARAJA palm, produces large clusters of fruit, resembling small grapes, with a thin pulp of an agreeable subacid flavor.

BACTRITES, a genus of fossil *ammonitidæ*, with a straight shell, and indented but not ramified septa. Five species have been described, all from Devonian strata.

BA'CULITES, a genus of the family of *ammonitidæ*, differing from the true *ammonites* (q.v.) in the perfectly straight form of the shell, which tapers to a point, and is either round or compressed. The species, like the other ammonitidæ, are all fossil. B. are characteristic of the upper chalk, and appear to have existed only towards the expiry of the period over which the existence of the ammonitidæ extended.

BA'CUP, a rapidly increasing and very prosperous t. of Lancashire, and station of the East Lancashire railway, situated in a beautiful valley near the borders of Yorkshire, 15 m. n. from Manchester, and 12 m. e. by s. from Blackburn. Great improvements have been and are still being made in the condition and appearance of the town. There are many churches of all denominations, a mechanics' and a literary institute, reading-rooms, etc., and in Aug., 1867, was opened a beautiful market-house. The pop. was 6981 in 1851, and 17,199 in 1871. B. has extensive cotton factories, dye-works, brass and iron foundries. There are numerous coal-mines in the neighborhood; and within a mile from the town, large woolen manufactories.

BADA'GRY, a seaport t. on the gold coast of upper Guinea. Pop. 10,000. At one time it carried on a large trade in slaves with the Portuguese, who here established several factories. B. now belongs to Great Britain. It was from this place that Lander and Clapperton started on their expeditions to explore the African interior.

BADĀJOZ', called by the Romans Pax Augusta, and by the Moors Beledaix, i.e., "Land of Health," is the capital of the Spanish province of the same name. It is situated about 5 m. from the borders of Portugal, in a fruitful district on the left bank of the Guadiana, which is here crossed by a stone bridge of 28 arches. It has 22,195 inhabitants, is a fortress of the first rank, the residence of a captain-general, and the see of a bishop, and has an old cathedral with a splendid organ, and paintings by Mateo Cerezo and Morales, who was born at B.; a brisk traffic, chiefly contraband, is carried on with Portugal. Its chief articles of manufacture are soap, coarse woolens, leather, and delft-ware. As one of the keys of Portugal, B. has often been a place of importance in war. It was besieged in vain by the Portuguese in 1660, and again by the allies, in the Spanish war of succession, in 1705. During the French war, B. was besieged by the French in 1808 and in 1809, and again in 1811, when it surrendered, Mar. 11, to Soult. It was thrice besieged by the English under Wellington: first on April 17, 1811, after the conquest of Olivenza, on which occasion, the approach of Soult to its relief caused the siege to be raised on the 14th of May; the second time, after the battles of Fuentes d'Onor and Albuera, the city was invested from May 27 to June 10, 1811, but still in vain. The third investment, Mar. 17, 1812, ended in the taking of the city by storm, on the night of April 6, after a murderous contest, and a loss, during the twenty days' siege, of 72 officers and 963 men killed, and 306 officers and 3483 men wounded.—The province of B. has an area of 8687 sq.m., and a population of (1870) 431,922. See ESTREMADURA.

BADAKHSHAN', or BUDUKHSHAN', a territory of central Asia, lying between 36° and 38° n. lat., and 69° and 73° e. long. B. lies between the chain of the Hindu Kush and the Oxus. It is drained by the Kokcha, a tributary of that river, and is famous throughout the east as a picturesque hill-country covered with woods, rich pasture, and fertile and well-cultivated valleys. Eastern travelers speak with rapture of its rich orchards, its fruits, flowers, and nightingales. In recent times no European traveler has visited it except capt. John Wood, who only saw it in the winter of 1838. The inhabitants are Tajiks, or an Aryan race speaking Persian and Turkee. They are Mohammedans—Sheas in the mountains, and Sunnas in the plains. Their number is estimated at 350,000. One of their chief occupations is man-stealing—their captives being chiefly Kafirs and Chitralis from the Indian side of the Hindu Kush. The people of B. seem to have been always under the immediate rule of their own chiefs, at the head of whom was "the Mir." They have generally, however, formed part of some great Asiatic empire. In the last century, B. formed part of the empire of Nadir Shah, after whose death it became subject to the Afghans. In 1823, however, the Uzbecks, under Murad Beg, taking advantage of the disturbed state of Afghanistan, defeated the tribes of B. in a pitched battle; and two years after, their subjection was completed. Their conquerors treated them most harshly, demolishing their towns, and either selling them as slaves, or carrying them off to people the unhealthy swamps of Kunduz. On the death of Murad in 1845, B. seems to have become for a time independent. The Afghans, however, soon reasserted their claims. In 1859, they conquered Kunduz, and were about to annex B., when the Mir agreed to pay an annual tribute. In 1863, Jehandar Shah, the Mir of B., was superseded by Mir Mamud Shah, another of the royal family of B., supported by the Afghans. This gave rise to a struggle which ended in the nephews of Jehandar acquiring dominion by means of Afghan help. In 1873, England and Russia discussed and agreed upon a frontier between B. and Afghanistan.—B. is sometimes made to include Wakan, on the upper Oxus, between B. proper and the Pamis Steppe (see BOLOR).—See Yule's *Marco Polo;* Vambéry's *Central Asia*, 1874; *Quarterly* and *Edinburgh Reviews*, 1873.

BADAR'KA, a t. of Oude, India, in the district of Bainswarra, 4 m. e. from the Ganges, and 5 m. e. from Cawnpore. Pop. 8000.

BADDECK, a village and capital of Victoria co., N. B., dominion of Canada, on the island of Cape Breton, accessible to steamers.

BAD'DERLOCKS, or HENWARE (*alaria esculenta*), a sea-weed (see ALGÆ), of the sub-order *fucaceæ*, growing on rocks in deep water on the shores of Britain, Iceland, and the northern parts of Europe. It has a stem 4 to 8 in. long, pinnated with a few short leaflets, which contain the seeds, and a membranous olive-green frond of 2 to 12 ft. long, with a stout mid-rib. The frond being stripped off, the mid-rib forms an article of food to the inhabitants of the sea-coasts of Iceland, Denmark, Scotland, Ireland, etc. The thinner part of the frond is also sometimes eaten.

BADEAU, ADAM, a native of New York; served on Sherman's staff, and was wounded at Port Hudson, in the rebellion. He was gen. Grant's military secretary, was brevetted as brig. gen. of the U. S. army, and was secretary of the American legation in England. He is the author of *Military History of Gen. U. S. Grant.*

BA'DEN, THE GRAND DUCHY OF, is situated at the south-western extremity of the German empire. With an area of 5900 sq.m., it runs in the direction of the valley of the upper Rhine and of the Black Forest, from the southern bend of the Main at Wertheim to the Bodensee or lake of Constance, and is bounded on the n. by Bavaria and Hesse-Darmstadt; on the e. by Hohenzollern, Würtemberg, Bavaria; and on the w. and s. by the Rhine, which separates it from Rhenish Bavaria, Alsace, and Switzerland. It is divided politically into four circles—the circle of the "Lake," at the s., and the circles of the "Upper Rhine," of the "Central Rhine," and of the "Lower Rhine;" these are again divided into 79 districts.

Surface and Hydrography.—Physically, B. falls into two divisions—the western plain, lying along the right bank of the Rhine, and the eastern highlands; the plain occupying about a fifth of the whole duchy, and the hilly part, four fifths. Of the mountain-ranges, the Schwarzwald, or Black Forest, is the most prominent. See BLACK FOREST. For a distance of 96 m., it belongs almost exclusively to Baden. It terminates in abrupt declivities towards the w., and on the e. descends by degrees into the plateau of the Neckar in Würtemberg. It decreases in height from s. to n., its mean elevation being from about 4000 to 2700 ft., and is cut up into sections by numerous deep and wildly romantic valleys. The most remarkable summits are Feldberg and Belchen in the south. The less elevated part of the mountainous division of B., which lies to the n. of the Murg, receives the general name of the Neckar highlands, as far as to its intersection by the Neckar valley, on the n. side of which the Odenwald begins. Southward, in the circle of the "Lake," rise the extensive plateaus of the German Jura. This table-land is known by the local name of the Randen. In the plain of the "Upper Rhine," between Altbreisach and Endingen, stands the small isolated basaltic group of the Kaiserstuhl, or emperor's seat, rising to the height of 1100 ft., and overlooking the Rhine.

Being drained by the Rhine and the Danube, B. belongs to the basins of two oppo-

site seas; the sources of the Danube, however, drain only about 336 sq.m. in the northern part of the "Circle of the Lake." Beginning with the Bodensee, which projects three arms or bays on the n.w. into B., the Rhine, in its tumultuous course, forms the s. boundary, interrupted, however, by several encroachments of the Swiss territories upon its n. bank. From Basel to below Manheim, the stream is the only and natural boundary. The chief tributaries of the Rhine, on the B. side, are the Neckar, the Kinzig, the Murg, the Elz, the Dreisam, and the Pfinz. On the n.e. the B. den territories are bounded by the Main, which there receives the Tauber. Except a part of the Bodensee, B. has no lake of importance. In the Schwarzwald, however, there are the following sheets of water which go by the name of lakes: Mummelsee, Wildsee, Feldsee, Titisee, and the Nonnenmattweiher, with a floating island.

Climate.—As the difference between the highest and lowest poinst of B.—Feldberg, which rises to height of 4860 ft., and Manheim—amounts to something like 4500 ft., there is naturally a great variety of climate, especially in respect of temperature. The mean temperature of the plains may be stated at 50°, and that of the highlands at 44° Fahr., so that the Rhine valley of B. is one of the warmest and most fruitful districts, not only of Germany, but of Europe; the land yielding often, in the case of maize, a return of more than 300 fold. Walnuts, cherries, apples, and pears grow in abundance, while the western terraces of the Schwarzwald are decked with vines. On these charming declivities, the walnut thrives at a height of 1340 ft., the grape at 1450 ft.; other kinds of fruit are cultivated in the higher regions to an elevation of more than 2000 feet. The wild cherry is found even as high as 2600 ft.; the cereals being profitably cultivated to at least an equal height. Oats rise as high even as 3600 ft., above which lie the exclusively pastoral districts.

About two thirds of the population are engaged in the cultivation of the land, which, as may be inferred from the description, yields rich returns. An area of about 3200 sq.m. is occupied with fields and gardens, growing wheat, oats, rye, barley, maize, potatoes, pulse, and vegetables of all sorts. Tobacco, hemp, rape, opium, etc., yield a large revenue. Meadow-land and pasturage occupy about a fifth of the surface. An important branch of cultivation is also the production of chestnuts, walnuts, almonds, etc. The quantity of wine produced yearly is, on an average, 14 million gallons. About 1790 sq.m. are under wood. The Schwarzwald is one of the most remarkable pine-forests of Germany. There whole tracts may be seen of pines of the height of from 160 to 180 ft., which are exported to the Netherlands for ship-building. The rearing of cattle is carried on to a large extent. The several kinds of stock may amount to the following numbers: horses, 73,200; asses, 700; cattle, 481,000; sheep, 189,000; goats, 22,100; swine, 480,000; making a total of 1,246,000 head of animals, and representing a large amount of wealth. Honey is also an important product, more than 74,000 beehives being kept in the duchy. Various societies exist for improving the breed of horses and perfecting agriculture.

Minerals.—The mineral wealth of the country does not seem to be valued yet as it deserves, if we may judge from the extent of mining operations carried on; but the activity of the mining society at Carlsruhe is yearly bringing this department of the national industry more and more into a fitting condition. Iron, lead, silver, copper, and salt are among the chief productions; gold is extracted from the sands of the Rhine, near Wittenweier, and cobalt, sulphur, marble, and several kinds of precious stones are found. B. is rich in mineral springs; as many as 60 are enumerated, some sulphureous, some chalybeate, and some acidulous. Hence there are a great number of much frequented watering-places, as Baden-Baden, Badenweiler, Griesbach, Petersthal, etc.

Manufactures, etc.—The increasing activity in the various branches of industrial art is testified by the existence of over 1200 manufactories, with about 70,000 hands, and a yearly produce of from 40 to 50 million marks. The industrial activity extends chiefly to the following articles: ribbons and cotton fabrics, mostly at St. Blasia; toys and trinkets, and tobacco, which occupies the first place; chicory, paper, cloth, leather, beer, wooden clocks, and articles of straw; the last two are characteristic of the Schwarzwald districts, and known all over the world. Of clocks alone, over 600,000 are made annually. The chief articles of export are wine and timber, which last is sent almost exclusively to the Netherlands, and brings in a sum of at least 6,000,000 marks (£300,000). The principal imports are colonial goods, fruits, drugs, horses, wool, cotton, silk goods, iron, steel, and articles of luxury. Money was formerly reckoned in guldens or florins of 24 to the mark of silver, a florin being equal to 20*d.* sterling; but now, under the new universal system of the German empire, in marks, approximately equal in value to shillings. Weights and measures are divided according to the decimal system.

Population, Religion, Education.—The pop. of B. in 1875 amounted to 1,506,531, being an increase of above 40,000 as compared with 1871. With the exception of Jews, the inhabitans are exclusively German. The dominant church is the Roman Catholic, whose adherents in 1871 numbered 942,560, or about two thirds of the whole population. Protestants numbered 491,008; Dissenters and Mennonites, 2265; and Jews, 12,475. The school-system of B. is excellent; it offers the means of instruction to every individual; and a multitude of libraries, museums, and collections of all sorts, are significant indications of the higher elements of culture.

Government.—The sovereignty of the grand duchy, which is strictly indivisible and

inalienable, is hereditary in the eldest of the male line, and, failing that, of the female. The heir-apparent is styled hereditary grand duke, and the other sons and daughters are called margraves and margravines. The sovereign is bound down by a parliamentary constitution. The parliament, which meets regularly every two years, consists of two chambers. The first chamber consists of the princes of the grand-ducal house, the heads of the seignorial families (7 princes and 3 counts), and of the nobility—on whom, when they possess hereditary property, under feudal tenure, to the value of 500,000 marks, the king confers the rank of the high nobility—the Catholic archbishop and the Protestant prelate, 2 representatives of the universities, and 8 members chosen by the grand duke, without regard to rank or birth. The second chamber consists of 63 representatives chosen for 8 years, 22 for the cities, and 41 for the country districts, giving 1 representative for about 21,540 inhabitants. As to the franchise, less regard has been paid in B. than elsewhere to the property qualification; every settled citizen and all state officials may take part in the nomination of electors, and may become electors; only representatives must either pay tax on a capital of 16,000 marks, or about £800, or be in possession of an ecclesiastical or secular office bringing in at least 2500 marks, or £125. The highest deliberative and executive body in the country is the council of state. The grand duke is its president, and it is divided, since 1870, into the ministeries—(1) of the grand-ducal house, of justice, and of foreign affairs; (2) of the interior; (3) of commerce. The expenditure, according to the budget estimates for the year 1875, was 30,200,813 marks; the estimated net receipts for the same year amounting to 29,896,478 marks. There is a particular budget dealing with the finances of the railways, and the steamers on the lake of Constance. 26½ millions of florins were added to the public debt of the country by the events of 1848 and 1849. The general debt of B. in 1875 amounted to 91,369,656 marks; that on the railways to 265,051,973 marks. The military affairs of B. are now exclusively regulated by the imperial power; the troops of B. form the major part of the 14th corps d'armée of the empire. The effective war-strength of the army in 1868 was 43,705; peace, 14,263. There exists three orders of knighthood, besides a medal for military service, and other decorations of merit. The capital and residence of the sovereign is Carlsruhe; the capitals of the four "circles" are Constanz, Freiburg, Carlsruhe (formerly Rastadt), and Manheim.

History.—The original inhabitants of B. were Alemanni. These fell under the dominion of the Franks, the conquerors of Gaul, and submitted at the same time to the Christian religion. Under their duke, Gottfried, they made repeated attempts to regain their independence, but in vain; and the dukedom of the Alemanni was abolished in 748 by Pepin the Little. In the 11th c., a duke Berthold, said to have been a descendant of the Alemannian Gottfried, built the castle of Zähringen in Breisgau, and with him begins the unbroken line of the princes of the house of Zähringen. A descendant of his second son took the title of margrave of B., and became the ancestor of the still flourishing house of Baden. He died in 1130. The history of this house presents, for long, little else but a succession of partitions of the territories among brothers, to be again and again reunited by one or other of the collateral branches becoming extinct. The prosperity of the country was thus greatly retarded. The present capital, Carlsruhe, was built in 1715 by the reigning count, Charles III. It is to his grandson, Charles Frederic, who succeeded in 1746, that B. owes considerable accessions of territory and political importance. By favoring the policy of Napoleon and joining the confederation of the Rhine, he doubled his possessions in extent and population, and acquired successively the dignity of elector and the title of grand duke. In 1811, he was succeeded by his grandson, Charles Ludwig Frederic, who, five years before, had married Stephanie Louise Adrienne Napoleone, an adopted daughter of Napoleon. After the battle of Leipsic, Charles Ludwig seceded from the confederation of the Rhine, and (1815) joined the German confederation, in which B. holds the seventh rank.

The original constitutions or "states" of the separate territories composing the grand duchy having mostly become extinct, the grand duke Charles granted (1818) the charter which forms the basis of the present constitution. Charles was succeeded in the same year by his uncle Ludwig, who was inclined to absolutism, and had to contend at first with a powerful opposition, which led him frequently to dissolve the chambers. He succeeded, in 1825, in carrying through an alteration of the constitution, extending the duration of the parliaments; after which the government and the chambers acted more harmoniously. Ludwig dying childless (1830), was succeeded by his brother Leopold. The known liberal tendencies of this prince promised at first a new life to constitutional government; but the tide of reaction, become strong since the fall of Warsaw, soon seized the government, and the act establishing the freedom of the press, which in 1831 had been hailed with delight by B. and the whole of Germany, was, in 1832, declared impracticable, and abrogated. A fluctuating contest between a reactionary government and a growing opposition was carried on till 1846, when the constitutional Bekk was made minister of the interior, and liberalism thus placed at the helm. The first effect was to calm the public mind, and to cause a split between the liberals and the radicals. The ninth parliament met (Dec., 1847) under the most friendly and promising auspices; when the French revolution (Feb., 1848), the vibrations of which were first felt by B., suddenly called the radical party into the most violent activity. Not satisfied with a multitude of liberal measures passed by the legislature, the revolutionary leaders, Hecker

and Struve, aimed at establishing a republic, and stirred up an insurrection. The troops having sided with the insurgents, the grand duke fled, and a constituent assembly was called (May, 1849). The duke had recourse to Prussian aid, and, after several battles, was reinstated on his throne (July, 1849). The restoration was followed by some 30 executions, consisting chiefly of soldiers that had borne arms against the government, and of a few political leaders. Upon the whole, the reactionary tendency has been less marked in B. than in most other German states, and many valuable reforms effected in 1848 have been retained. See GERMANY.

BA'DEN, a t. and fashionable watering-place in the canton of Aargau, Switzerland, is situated on the left bank of the Limmat. It has a pop. of (1870) 3412. It is of ancient date, being known to the Romans as *Thermæ Helveticæ*. The temperature of the baths is as high as 117° Fahrenheit. B., from the 15th to the beginning of the 18th c., was the seat of the Swiss diet.

BA'DEN-BA'DEN, a town in the grand duchy of Baden, situated in a pleasant valley at the base of the Black Forest. It contains (1875) 10,958 inhabitants; but its visitors during the season, which is at its height in July and Aug., are often double the number of the settled population. It is chiefly celebrated for its medicinal springs, which were known in the time of the Romans. B. having been a fashionable place of resort so early as the days of Antoninus and Aurelius, numerous Roman antiquities have been found in the neighborhood, and are preserved in a museum here. There are several springs of a saline character, varying in temperature from 117° to 154° F. These springs are impregnated with iron, magnesia, and lime, with sulphuric and carbonic acid, and are especially recommended in chronic cutaneous diseases, gout, rheumatism, etc. The chief spring discharges in 24 hours about 4200 cubic ft. of water. The gaming-tables of B., the most renowned in Europe, were closed with the rest of the licensed German gaming-houses in 1872.

BA'DEN BEI WIEN (i.e., "Baden near Vienna"), a much frequented watering-place of lower Austria, about 15 m. s.s.w. of Vienna. It was the *Aquæ Pannoniæ* or *cethiæ* of the Romans, and is still famous for its warm mineral springs, which are frequented during the season by from 12,000 to 15,000 persons, chiefly from the Austrian capital. The temperature varies from 90° to about 99° F. The baths are frequented by persons of both sexes, who, in the bath, promenade arm in arm. Many of the Austrian nobility have palaces here. The favorite walk in the neighborhood is along the romantic valley, the Helenenthal. Pop. '69, 7590.

BA'DENOCH, a highland district in the s.e. part of Inverness-shire, 30 m. long by 15 broad, bounded by Lochaber, Athole, Braemar, and Murray, and traversed by the Spey. It is much covered with forest, and is chiefly composed of gneiss rock, with a little granite. It was a lordship, held during the 13th c. by the eldest branch of the great house of Cumyn, on whose forfeiture Bruce bestowed it on his nephew Randolph. In 1371, king Robert II. gave it to his son, "the wolf of Badenoch," on the failure of whose descendants it reverted to the crown, which, about 1456, granted it to the earl of Huntly.

BADGE, the term by which, in general, all honorary decorations and special cognizances are known. Badges are either conferred by the state or sovereign, or assumed by the individual for purposes of distinction, the former class having very frequently had their origin in the latter. Of badges conferred by public authority, for the purpose of inciting to exertion, and gratifying honorable ambition, numerous instances are to be met with in every part of the world. The garter of the English knight, the golden fleece of the Spanish grandee, and the button of the Chinese mandarin, will occur as familiar examples. To the same class belong not only the stars and crosses with which princes and other persons of rank are adorned in this country, and to a far greater extent on the continent, but the medal of the private soldier, and even those not less honorable decorations which are now frequently conferred by private societies for acts of voluntary daring, such as the medal given by the humane society for saving from drowning. Amongst the ancients, one of the most usual emblems of authority was a gold ring, which was worn generally on the fourth finger. A ring of this description was the mark of senatorial and magisterial dignity, and latterly of knighthood at Rome; iron rings, during the earlier period, at all events, having been used by private citizens. The right of wearing a gold ring (*jus annuli aurei*) was gradually extended, till at length Justinian conferred it on all the citizens of the empire. In the early times of the republic, when ambassadors were sent to foreign states, they were furnished with gold rings, which they wore during their mission as badges of authority. From an early period, every freeman in Greece appears to have used a ring, though the custom, not being mentioned by Homer, can scarcely have belonged to the earliest period of the history of that people, and is commonly supposed to have been of Asiatic origin. Rings are often mentioned in scripture as badges of authority both amongst the Jews and other oriental nations. We read of Pharaoh taking off his ring and putting it on Joseph's hand, as a token of the power which he committed to him (Gen. xli. 42); and still earlier (Gen. xxxviii. 18), Judah left his signet with Tamar as a pledge. In the New Testament, rings are spoken of rather as marks of wealth and luxury than as badges of official rank; e.g., James ii. 2. and Luke xv. 22, where, on the return of the prodigal son, the

father ordered that a ring should be put on his finger. As to the workmanship and materials of ancient rings, see RING, SIGNET, etc. Of badges assumed for the purpose of distinction, none are more famous than the white and red roses of York and Lancaster. Henry VII. combined these two emblems, first carrying a rose per pale, white and red, and afterwards placing the white rose within the red one. One of queen Elizabeth's badges was a golden falcon perched on the stump of a tree between two growing branches of white and red roses, a B. which is said to have been given to her mother, Anne Boleyn, by Henry VIII. The *bear and ragged staff*, which still exists as a sign in London, was the B. of the great earl of Warwick. The *white hart* and *silver swan*, which are frequently met with as signs to inns, have a similar origin, the first having been the B. of Richard II., and the second having belonged to the house of Lancaster. The *garb and sickle*, the B. of the Hungerfords, is another very beautiful and less common example of the same class of badges. Different countries have also distinctive badges, generally connected with the history either of the actual ruling or of some former dynasty. Of these, the *fleur de lis* of France, and the other badges, for which it from time to time makes way—viz., the cap of liberty and other emblems of republicanism, the eagles of the empire, borrowed from Rome, and the bees and other insignia which the Bonaparte family have assumed, may all be taken as examples.

B. of England.—The present B. of England is a rose white and red, ensigned with the royal crown. The initials V. R., ensigned with a crown, which are used on military accouterments, is also a species of national badge.

B. of Scotland is a thistle ensigned with a royal crown.

B. of Ireland.—Ireland has two national badges—the golden harp and the trefoil, both of which are carried ensigned with the royal crown.

The three badges of England, Scotland, and Ireland, carried conjoined, may be seen under any representation of the royal arms.

B. of Wales is a dragon passant, wings elevated, gules, on a mount vert.

B. of Ulster is on a shield or canton, *or*, a sinister hand erect and apaumée, *gu.* This B., which is popularly known as "the bloody hand," is borne in the paternal coats of English baronets.

B. of Nova Scotia, which is borne by the Nova Scotia baronets, is, *or*, a saltire *azure*, thereon an escutcheon of the arms of Scotland, and ensigned with an imperial crown, the motto being, *Fax mentis honestæ gloria.*

One of the oldest and most celebrated badges in existence is the so-called jewel of king Alfred. For the badges of the different orders of knighthood, see their respective titles.

BADGER, *Meles*, a genus of quadrupeds of the bear family or *ursidæ* (see BEAR), and included by Linnæus in the genus *ursus* or bear, but forming a sort of connecting-link between this family and the *mustelidæ* or weasel and otter family. To the skunks (q.v.), which are ranked in that family, the badgers have a particularly strong resemblance, and their dentition and habits are almost the same. The dentition of badgers differs from that of bears chiefly in the large size of the tuberculous molar teeth at the bottom of each jaw, showing a still greater adaptation to vegetable food. Badgers, like the rest of the family to which they belong, are plantigrade, i.e., they walk on the whole sole of the foot, and not merely on the fore part of it. The body is thus brought nearer to the ground than it otherwise would be from their length of limb. The head is long, with a pointed muzzle, the tail short, the skin very thick and tough, the hair long. The gait is slow, the habits nocturnal and solitary. There are five toes on each, both of the fore and hind feet, and the feet are peculiarly adapted for digging and burrowing. A peculiar characteristic of the badgers, not found in any other quadrupeds of the same family, is the possession of a bag, beneath the tail, for the secretion of a peculiar substance, of a disagreeable odor, which is supposed to be of use in directing the sexes to each other in their solitary wanderings.—The common B. (*M. taxus* or *M. vulgaris*) is the only quadruped of the bear family now found in the British islands. It is widely diffused over Europe and the middle parts of Asia. It is grayish brown above and black beneath; the head white, with a longitudinal black band on each side; the body long but robust, in size about equal to that of a small fox, the hair coarse and reaching to the ground as the animal walks. The average length is 2 ft. 6 in., and the height at the shoulder 11 inches. It haunts the gloomy recesses of woods, or thick coppices on the sides of hills, and digs for itself "a deep and well-formed domicile, consisting of more than one apartment, the single entrance to which is by a deep, oblique, and even tortuous excavation." In this, or similar excavation, the B. sleeps through the winter. The B. makes use of its nose in digging, scrapes with the fore-paws, flinging the earth as far back by them as possible, and, when the accumulation is considerable, pushes it away by means of the hind-feet. The B. is extremely cleanly in its habits. It is one of the most perfectly omnivorous of animals, in a wild state as well as in confinement; fruits, roots, beech-mast, eggs, young birds, small quadrupeds, frogs, snails, worms, and insects, equally constitute its natural food. It has been known to visit a garden for strawberries. It is also fond of honey, and of the larvæ of wasps and wild bees, for the sake of which it digs up their nests, its hide being impervious to their stings. It is often caught by placing a sack in the mouth of its hole, when it is out at

night; dogs are then sent into the wood to alarm it, upon which it flees to its hole. Dogs sent into the hole are often foiled by earth which the B. throws back upon them to block up their way; nor is it easy for a dog to contend with it, owing to its great strength, and particularly the strength of its jaws. A barbarous sport was formerly, and to some extent still is practised, called B.-baiting, or *drawing the badger*. A B. kept in a barrel was assailed by dogs, and at last, yielding to superior numbers, was dragged out, upon which it was released and allowed to go back to its den, to recover itself, and be baited again, which happened several times daily, when the B. was kept as an attraction to a public-house of the lowest sort. The verb to *badger*, expressive of persevering annoyance by numerous assailants, was originally employed with reference to the practice of B.-baiting. The flesh of the B. is said to be very agreeable, particularly when cured in the form of hams. It is much used in China. The B. is easily domesticated when taken young, and becomes very familiar. In Scotland and the north of England, a B. is still called a *brock*, its Anglo-Saxon name; and in some parts of England it is termed a *gray*, from which some derive grayhound.—The balysaur of India, also called the sand bear and Indian B. (*M. collaris*), very much resembles the common B., but is taller, and has a more hog-like muzzle, and a longer tail. Its habits and its food are similar to those of the common B., and, when attacked, it defends itself with great vigor. It is chiefly found in hilly districts.—The American B. (*M. Labradorica*) was at first supposed to be a mere variety of the European B., but has proved to be very distinct, so that it has been regarded by some naturalists as worthy of a separate genus (*taxidea*), and is sometimes called *taxel*. Its teeth are more adapted than those of the B. for carnivorous subsistence, and it chiefly preys on small animals, such as marmots, which it pursues into their holes in the sandy plains near the Missouri and the Rocky mountains. It is in that region that it abounds, over a considerable range of latitude, but it is not known to exist in Labrador, so that its specific name is perhaps the perpetuation of an error. In its pursuit of the smaller quadrupeds upon which it preys, it enlarges their burrows, and renders some parts of the plains dangerous to persons on horseback. Its prevailing color is hoary gray in winter, yellowish brown in summer, the under parts generally yellowish white; a white stripe runs from the nose over the forehead to the neck. The hair becomes not only very long but woolly in winter.—The burrowing powers of this animal are extraordinary. It sometimes makes burrows 6 or 7 ft. deep, running under ground to a length of 30 feet.

BADGER, Milton, D.D., 1800–73; a native of Connecticut, a graduate of Yale, and in theology at Andover; pastor of a congregational church there; officially connected as secretary with the American home missionary society for 38 years, in which responsible relation he was noted for wise and faithful service.

BADI'A-Y-LEBLICH, Domingo, known also by the name Ali-Bei-el-Abbassi, one of the most enterprising of modern travelers, was b. at Barcelona, April 1, 1767. He studied the Arabic language, and also physical science and mathematics at Valentia. Possessed of a lively and restless spirit, he formed the project of visiting Africa and Asia, under the disguise of a Mussulman, both for the purpose of avoiding the suspicions of the natives when visiting those places forbidden to Christians, and also for giving greater *éclat* to his adventures. In pursuance of this scheme, therefore, he resigned an office under government in the year 1797, and went to Madrid, to make proposals of a scientific and mercantile tour of exploration in Africa. Having gained promises of support from Don Godoï, the prince of peace, he betook himself for a short time to London, to study commerce and politics. He also spared no labor to make himself familiar with the manners and customs of the people he was about to visit; and in his anxiety to escape detection, he even ventured to undergo the severe ordeal of circumcision. In 1803, he sailed for Africa, where he represented himself, under the name of Ali-Bei, as a descendant from the Abbasides. His tact and talents gained for him such esteem that he was invited to the court of the Emperor of Fez and Morocco. After a two years' residence in Morocco, he set out on a pilgrimage to Mecca in 1805, and after sojourning some time in Tripoli, Cyprus, and Egypt, arrived at the holy place in 1807, being the first Christian that had visited it since the institution of Islam. Subsequently, he visited Jerusalem and the chief places in Palestine and Syria, and in the autumn of 1807 arrived at Constantinople, whence he had soon to flee, the reality of his Mohammedanism being suspected. After his return to Spain, he was made intendant of Segovia and prefect of Cordova; but the easy way in which he shelved his patriotism, and submitted to the French conquerors, was fatal to his prospects, for, on the expulsion of the latter, he was compelled to leave the country. He went to Paris, where, in 1814, he published an account of his travels under the title *Voyages d' Ali-Bei en Afrique et en Asie pendant les Années* 1803 *à* 1807. His work was translated into most of the European languages. Four years after the publication, B. set off on another journey to the east, but died suddenly at Aleppo on 30th Aug., 1818. The Pasha of Damascus seized his papers, so that his second enterprise has been without results for Europe.

BADIUS, Jodocus, or Josse, 1462–1535; an eminent painter in Paris, who previously studied at Brussels and Ferrara, and for several years taught Greek at Lyons. He illustrated and printed several of the classics, and produced a life of Thomas à Kempis, and a satire on the follies of women, called *Novicula Stultarum Mulierum.*

BADMINTON, a popular game closely resembling lawn tennis, is played with battledore and shuttlecock on a rectangular portion of a lawn. The ground is divided crosswise by a strip of net, not less than 3 in. wide, suspended from poles at a height of 5 feet. As in lawn tennis, the ground on either side of the net is divided lengthwise into right and left courts. The first player standing on a specified part of his right court, must strike the shuttlecock so as to fall across the net into the back section of the right court opposite. The opponent strikes it back, then it is returned by the first player, and so on till the first player misses the shuttlecock. After the first stroke it suffices that the shuttlecock be sent across the net, if it does not fly beyond the boundaries.

BADRINATH. See BHADRINATH, *ante*.

BAEL, or BHEL. See AEGLE.

BAËNA, a t. in the province of Cordova, Spain, of about 12,000 inhabitants. It is situated about 24 m. s.s.e. from Cordova, on the river Marbella, and carries on a considerable export and inland trade, chiefly in grain and oil. B. was a Roman town; and a Roman sepulchre was discovered here in 1833.

BAER, KARL ERNST VON, a distinguished Russian naturalist, was b. Feb. 29, 1792, in Esthonia. During 1810–14, he studied medicine at the university of Dorpat, but convinced that Russia as it then was presented very few advantages for the acquisition of scientific knowledge, he went to Germany in 1814, where he studied comparative anatomy under Döllinger in Würzburg. He also made the acquaintance of prof. Nees of Esenbeck, who exercised a considerable influence over him. In 1817, he went to Königsberg, where, two years after, he was appointed professor of zoology, and charged with the organization of the zoological museum. In 1834, he was called to St. Petersburg, and was soon known as one of the most active members of the academy (of which he became an honorary member in 1862). As a naturalist, he has specially occupied himself with the difficult subject of embryology; and to his laborious investigations we owe several most valuable discoveries in regard to the development of organic bodies. Beginning with his *Epistola de Ovi Mammalium et Hominis Genesi* (Leip. 1827), he still further elucidated this subject in his *History of Animal Development* (Königsberg, 1828–37) and *History of the Development of Fishes* (Leip. 1835). After his return to St. Petersburg, he made the polar regions the objects of his study. He examined carefully the northern shores of Russia, and published a minute description of their fauna and flora. He suggested valuable improvements in the Russian fisheries. In 1864, the 50th year of his doctorate was celebrated by the Esthonian nobility, at whose expense a splendid volume was published, containing B.'s autobiography. He d. Nov. 29, 1876. His *Reden* and *Kleine Aufsätze* appeared in 1864–75; the *Beiträge zur Kenntniss des Russichen Reichs* (26 vols.) in 1864–75.

BAEZ, BUENAVENTURA, b. 1820; president of the republic of San Domingo and thrice re-chosen. He was the son of a mulatto, inherited a large fortune, and was prominent in securing Dominican independence. In 1853, he was driven from the country by Santana; returned in 1856; was again driven out in Jan., 1858; again returned in 1865, and was elected for the third time. The next year an insurrection drove him into exile; and in the following year he was again restored. B. endeavored to secure the annexation of Dominica to the United States, but the U. S. senate declined the offer.

BAE'ZA, a handsome old t. of Spain, in the province of Jaen, from the capital city of which it is about 22 m. distant in the n.e. direction. Pop. about 12,000. It was here that the younger Scipio routed Asdrubal with immense loss, taking 10,000 Spaniards prisoners. It was a flourishing city under the Moors, several of whose caliphs and kings resided here, but it never fairly recovered its sack by St. Ferdinand in the 13th century. Gaspar Becerra, the celebrated sculptor, was b. here in 1720; but B. is chiefly proud of being the birthplace of the 11,000 virgins, usually named of Cologne. Its principal buildings are the university, the old monastery of St. Philip de Neri, the cathedral, and the Jesuits' college. B. has manufactures of leather.

BAF'FA, the *Paphos* of ancient times, a seaport t. on the s.w. coast of the island of Cyprus. It has now fallen much into decay, and has but a small population, who trade in cotton, silk, and grain; but under the Venetian rule, it was a place of considerable importance. The present t. occupies the site of New Paphos, which, under the Romans, was a beautiful city, full of fine temples and other public buildings. The Old Paphos, famous as the place where Venus landed immediately after her birth from the foam, and as her favorite residence, stood a little to the south-east. A hundred altars were here erected to her name, to which numerous worshipers, male and female, from New Paphos, trooped annually to pay their devotions. An earthquake in the time of Augustus destroyed the Roman Paphos, but it was rebuilt soon afterwards. The Roman deputy-governor, Sergius Paulus, was here converted by St. Paul.

BAFFIN, WILLIAM, 1584–1621; an English navigator of whose early life nothing is known. In 1612, he accompanied James Hull in his search for a north-western passage, and in 1613, commanded the English whaling fleet in the Arctic seas. In 1616, he went north in the *Discovery* under Bylot, and explored the inlet now known as Baffin's bay.

In 1621, he was killed while trying, in conjunction with a Persian force, to expel the Portuguese from Ormuz.

BAFFIN'S BAY, a gulf, or rather sea, on the n.e. coast of North America, extending between that continent and Greenland; lat. 68° to 78° n., and long. 51° to 80° east. It is about 800 m. long, with an average breadth of 280. Its greatest depth is 6890 feet. The tides do not rise more than 10 feet. The currents are generally towards the s., though recent investigations would seem to show that on the e. side of Davis' strait and B. B. a current from Spitzbergen flows northwards round cape Farewell. The shores are for the most part lofty and precipitous, backed by ranges of snow-clad mountains. The prevailing rocks are granite and gneiss. The principal animals inhabiting the coasts are, on land, bears, black foxes, and hares; in the sea, the black whale, walrus, and seal, gulls, ducks, and other sea-fowls. The s. shore of Whale sound on the e. coast in lat. 77° 20′ n. was found by capt. Inglefield in 1852 to be inhabited. There are Danish settlements on Disco and Whale islands. B. B. communicates with the Atlantic ocean by Davis' strait; and with the Arctic ocean by Smith sound on the n., and Lancaster sound on the west. Wellington strait, which forms the n.w. outlet of Lancaster sound, was entered in 1852 by Sir E. Belcher. B. B. was first explored in 1616 by William Baffin, after whom it was called, and who was pilot of the expedition, which was commanded by Bylot. Baffin's title to this honor seems to have been most faithfully earned; and the accuracy of his observations and descriptions has been confirmed by subsequent navigators. Whale and seal fishing are prosecuted to a large extent in B. B., which, on account of ice, is only navigable for some two months in summer.

BAFFO, a Venetian lady of singular beauty and talent, called "the pure." She was captured by pirates in 1580, and made a slave in Constantinople, afterwards becoming the sultana of Amurath III., over whom she had great influence. After his death she was the counselor of her son Mohammed III., who drowned all his father's wives except her. She died during the rule of her grandson.

BAGA'RIA, or BAGHERIA, a t. of Sicily, in the province of Palermo, 9 m. e. by s. from Palermo, with which it is connected by railway. Pop. about 12,000. It is beautifully situated at the base of the isthmus which separates the Bay of Palermo from that of Termini, and is surrounded by groups of palatial villas of the Sicilian nobility, abandoned after the proprietors had ruined themselves by the festivals here celebrated in honor of queen Caroline, at the commencement of the present century.

BAGASSE, CANE-STRAW, or CANE-TRASH, is the refuse matter obtained during the expression of the saccharine juice from the sugar-cane. In the manufacture of sugar (q.v.), the sugar-canes, in lengths of 3 to 4 ft., are passed between heavy rollers, which only partly squeeze out the juice, and yield the bruised canes, or B., still retaining a large percentage (usually about 18) of sugar.—The only use to which the B. is put is as fuel in the heating of the boilers and pans in the sugar manufactory. The improved apparatus introduced of late years has done much to save the large amount of sugar wasted in the B. and other parts of the process, which at one time amounted to not less than one half of the entire quantity of the sugar in the sugar-cane.

BAGATELLE (Fr. signifying primarily any trifle), the name of a game somewhat resembling billiards. A bagatelle-table is usually about 7 ft. long and 21 in. broad; it is lined with cloth, and a game is performed on it with balls and a cue or mace. The balls are small ivory spheres, and the sport consists in striking one or more into the holes at one end of the board. To perform this and other feats, some skill and experience are required, and the sport is far from unamusing in a cheerful parlor circle. Of late years bagatelle-tables have become very common in the houses of the middle classes of society; they possess the recommendation of being purchasable at a small expense.

BAGAUDÆ, or BAGAUDI, peasants of Gaul who resisted Roman oppression about 270 A.D., capturing and destroying Augustodunum (now Autun). Claudius temporarily repressed them, but Aurelian made concessions to them, and proclaimed general amnesty. They rose again in 294, and Maximian was sent against them. Their first leader was Victoria; subsequently there were two, Ælianus and Amandus, the latter calling himself emperor. Extant coins show that they had more than one emperor. The two last named fell in battle, and Maximian utterly defeated their forces; but they were troublesome to Rome until the end of the western empire.

BAGDAD, the name of a t. and pashalic in the s.e. of Asiatic Turkey. The pashalic extends from lat. 30° to 38° n., and from long. 40° to 48° e.; and is bounded on the n. by the pashalics of Diarbekir and Van; on the w. and s., by Syria and Arabia; and on the e. by Persia; while at its s.e. extremity lies the Persian gulf. Extreme length, 550 m.; breadth, 350. Pop. 2,000,000. It is watered by the rivers Euphrates and Tigris, which unite their streams at the town of Korna, in lat. 31° n., and long. 47° east. The pashalic of B. is usually divided into three parts. 1. That e. of the Tigris, comprehending the districts of *Khuzistan* (anciently, *Susiana*) and *Kurdistan* (part of ancient Assyria), the former of which is rich in grain and fruit. 2. That w. of the Euphrates, a sterile waste, losing itself at last in the great Syro-Arabian desert. 3. That between the two rivers, the northern portion of which is known under the name of *Algesirah*, or "the island"

(anciently, *Mesopotamia*), and the southern under that of *Irak-Arabi* (anciently *Babylonia* and *Chaldea*). The last of these divisions, though now a barren wilderness, was in ancient times luxuriantly fertile, the seat of mighty empires, and inhabited by industrious populations. The barbarous misgovernment and wretched incapacity of the Turks have reduced it to its present condition. The pashalic produces, in the better-cultivated districts, crops of rice, wheat, maize, barley, with some hemp, flax, tobacco, etc., while dates are brought to great perfection. The chief wild animals are lions—not numerous—hyenas, jackals, wolves, gazelles, ostriches; the chief domestic ones are horses, asses, mules, buffaloes, camels, and dromedaries. The inhabitants are composed of Turkomans, Armenians, Turks, Jews, Arabs, and Kurds; the last two of which races are notorious for their open and audacious depredations, their mutual wars, and their utter contempt for the authority attempted to be exercised over them. Principal cities—Bagdad, Bassora, and Mosul. For a description of the cities which in ancient times adorned this region, see ASSYRIA, BABYLON, NINEVEH, CTESIPHON, SELEUCIA, etc.

BAGDAD, the capital of the pashalic of the same name, is situated on both banks of the Tigris, in lat. 33° 20′ n., and long. 44° 23′ e. Pop. estimated at 60,000. The city is surrounded by a brick-wall, 5 m. in circumference; the two parts are connected by a bridge of boats, and the communication is guarded by a citadel. It has an extremely picturesque appearance from the outside, being encircled and interspersed with groves of date-trees, through which one may catch the gleam of domes and minarets; but it does not improve on closer inspection. The streets are narrow, crooked, unpaved, and dirty, full of ruts, and strewed with dead carcasses, which, however, are for the most part removed by dogs, the only public scavengers in the east. The exterior of the individual houses corresponds with the repulsive aspect of the streets. They have, in general, no windows towards the front, and are built of old brick; but their interior is often very gorgeously decorated. The vaulted ceilings, rich moldings, inlaid mirrors, and massive gilding, bring back to the recollection of the traveler "the golden time of good Harun Al-Raschid." B. contains upwards of 100 mosques. These, together with the khans, bazaars, and the palace of the governor, are the only noticeable buildings in the city. The domes and minarets are said to be finer than those of Constantinople, and are beautifully painted. The bazaars exhibit the produce of both Turkish and European markets; but commerce has greatly decreased since Persia began to trade with Europe by way of Trebizonde on the n., and by the Persian gulf on the south. Nevertheless, though no longer the chief emporium of merchandise between east and west Asia, and though robber Kurds and Arabs lurk on all the roads that lead from the city, B. still carries on a considerable traffic with Aleppo and Damascus, and has manufactures of red and yellow leather, silks, and cotton stuffs. The value of goods that passed through the custom-house at B., in 1874–75, was £452,498. Of the 60,000 inhabitants, the greater part are Turks and Arabs; the remainder are Jews, Armenians, Hindus, Afghans, and Persians. In summer, the heat is oppressive; rain does not fall on more than 20 or 30 days throughout the whole year; but when the snows melt on the Armenian hills, the Tigris becomes a majestic, and often a destructive river. In 1831, an inundation destroyed one half of the town, and several thousand lives. The plague visits it periodically—once every 10 years. In 1831, 4000 people perished daily for several days from its ravages! B. is frequently chosen by Mohammedans of the Shiah sect as a permanent place of residence. Several steamers now ply on the Tigris to and from B.; and here is one of the chief stations of the Anglo-Indian telegraph.

B. was founded by the Abbaside caliph Almansur, 762–766 A.D. It was built out of the ruins of Ctesiphon and Seleucia. In the 9th c., it was greatly enlarged by Harun Al-Raschid, who erected numerous edifices on the e. side of the Tigris, and connected its two banks by a bridge of boats. The palace, built for himself, and the tomb of his favorite wife, Zobeide, are said to have been of extraordinary splendor. A hundred years later, B. was ravaged by the Turks. In 1253, the grandson of Genghis Kahn, Hulaku, put an end to the old caliphate; but the descendants of this Tartar conqueror were expelled by Timur, who took the city in 1393. After several vicissitudes, it remained in the possession of a Turkoman chief, whose dynasty governed until 1470. In the beginning of the 16th c., Shah Ismail, the founder of the Suffide dynasty in Persia, made himself master of it; since which period it has repeatedly been a bone of contention between Turks and Persians. After a memorably obstinate siege, it was conquered by the sultan, Murad IV., in 1638. Nadir Shah vainly essayed to retake it in the 18th c., and ever since it has been under the sway of the porte.

BAGGAGE, in the marching arrangements of the British army, is placed under strict rules, in order that accumulation of weight may not impede the movement of the troops; and rules of an analogous kind are enforced in troop-ships, when soldiers are on a voyage. The term itself is made to apply chiefly to articles of clothing, and to small personal effects. A private soldier is allowed to carry nothing except that which his knapsack and other accouterments can hold; but those who are married with their officers' consent—a small number in every regiment—are allowed one small chest each, of definite size, which may be carried on a march, but at the men's own expense. Staff-sergeants and pay-sergeants have similar permission. The baggage-wagons are not expected to receive packages weighing more than 400 lbs. each, or as much as four men can lift.

Officers' B. is, of course, much more considerable in amount than that of the non-commissioned officers and privates. On board troop-ships, the weight to be carried for each person is strictly defined—from 18 cwt. for a field officer, down to 1 cwt. for a married private soldier, with his wife and children. In encampments, whether permanent or temporary, and in armies on field-service, the utmost care is taken to preserve the B. from the enemy, by surrounding it as much as possible with defensive troops.

BAG'GESEN, JENS, a well-known Danish poet, but who also has a place in German literature, was b. at Korsör, in the island of Zealand, Feb. 15, 1764. He first obtained a reputation by his *Comic Tales* (1785), the opera *Holger Danske* (1790), as well as by his odes and songs. Through the kind assistance of the prince of Augustenburg, he was enabled, in 1789, to make a tour through Germany, Switzerland, and France. In 1811, he was appointed professor of Danish language and literature at Kiel; in 1814 he removed to Copenhagen, where he became involved in an unseemly strife with Öhlenschläger, and in 1820 he left his native country altogether. Some years later, a home-sickness seized him, and he set out on his return, but died at Hamburg, Oct. 3, 1826. B.'s nature was a curious compound of pride and humility, love and hate, sensitiveness and reflective power, free-thinking and faith; and these conflicting qualities also appear in his poems, which possess an unfinished and inharmonious character. In 1803 appeared at Hamburg a collection of his German poems; in 1806 he published an idyllic epic, entitled *Parthenais oder Alpenreise* in twelve cantos, and written in hexameters, which greatly increased his reputation. It contains single passages of great beauty. B. possessed no lyrical talent, in spite of his warm-hearted and enthusiastic character. Only a few of his songs exhibit that simplicity and tenderness which are the essential requisites of song-writing; and, besides, they are almost all destitute of originality. Klopstock was the model whom he had in view in the composition of his odes; but he was far from reaching the level of his master. The sphere in which he shone most conspicuously was the serio-comic. His "humorous epic" (as he called it) of *Adam and Eve,* published shortly after his death, is a singular mixture of humor, pathos, levity, and earnestness. He left in manuscript a poem of a similar character on the subject of Faust. His *Poetical Works in the German Language* (Leip. 1836, 5 vols.) have been published by his son, who has prefixed to them an excellent biography.

BAGHERMI, or BAGIRMI. See BEGHARMI, *ante.*

BAGLI'VI, GEORGE, a celebrated Italian physician, b. at Ragusa, in Sept., 1669. The incidents of his life are almost entirely confined to his professional career. Originally descended from an Armenian family, he took the name of his adoptive father, who was a wealthy physician of Lucca, and who bestowed on him an excellent education. He studied at Salerno, Padua, and Bologna, and afterwards visited the principal hospitals of Italy. In 1692 he went to Rome, where he enjoyed the anatomical prelections of his friend Malpighi. Shortly after, he was appointed professor of anatomy at the college of La Sapienza, Rome, where he died in 1706. His great discovery in medical science is the system of "solidism," as it is called. Previous to the time of B., physicians had held the doctrine of Hippocrates in reference to the primary seat of diseases—viz.: that it is in the fluids. B. came to the conclusion that this was erroneous, and that the real seat of disease is in the solids. His reasons are, on the whole, sound, and the doctrine is now all but universally prevalent, though it is admitted that cases do occur in which the fluids appear to have been first affected. He published several treatises of great merit, in which his then novel views were explained. B. was very honest and independent in his judgment, and used to warn his profession against a blind adherence to mere dogmas on matters which were but imperfectly known.

BAGNA-CAVAL'LO, an inland t. of Italy, formerly belonging to the papal states, 11 m. w. from Ravenna, in the province of that name. Pop. about 3900. B. was a Roman city, called Tiberiacum, in honor of Tiberius.

BAGNACAVAL'LO, BARTOLOMMEO RAMENGHI, 1484–1542; an Italian painter, whose real name was Ramenghi, but he was called B. from the village where he was born. At Rome he was a pupil of Raphael, and worked on the decorations of the gallery in the Vatican. At Bologna he took the leading place, and did much to improve the style of the Bolognese school. His works are distinguished by rich coloring and graceful delineation. The best specimens, the "Dispute of St. Augustin," and a "Madonna and Child," are at Bologna, where he died.

BAGNA'RA, a seaport t. of south Italy, on the gulf of Gioja, 16 m. n.e. of Reggio. Excellent wine is produced in the neighborhood. Pop. 6229.

BAGNÈRES, the name of two towns in the Pyrenees, France, both well known as watering-places.—B. DE BIGORRE on the Adour, in the department of the High Pyrenees, is situated at the base of Montalivet, and at the entrance to the romantic valley of Campan. Besides its extensive bathing-houses, it has a college, a theater, a Pyrenean museum, a trades hall, and contains ('76) 7598 inhabitants. By the Romans it was known as *Vicus Aquensis* or *Aquæ Bigerronum.* It was destroyed by the Goths, but the fame of its waters survived, and is now so great that it is visited by about 20,000 strangers yearly. The tepid, warm, and hot saline springs are numerous, and are recommended for cutaneous and nervous diseases. Woolens, linens, and bareges are manu-

factured here.—B. DE LUCHON—the *Aquæ Convenarum* of the Romans—is situated in the department of Upper Garonne, and in a pleasant valley watered by the Pique. Its cold, tepid, and hot sulphurous waters are recommended in rheumatism, gout, cutaneous diseases, and paralysis. It has a pop. of ('76) 3982.

BAGNES, the convict-prisons of France. In ancient times, the severest punishment, next to death, was that of the galleys (q.v.). In 1748, these were abolished, and the convicts were employed in hard labor in arsenals and other public works; and the prisons in which they were lodged were called *bagnes,* from the Italian *bagno,* literally, a bath—a name supposed to have originated in the fact, that the slave-prisons at Constantinople contained baths, or because they stood near the baths of the seraglio. The constituent assembly of 1791 and 1792 mitigated the sufferings of convicts, and substituted for the detested name *galères,* that of *travaux publics,* to which succeeded the *travaux forcés,* of the code Napoleon. The practice of branding criminals with a hot iron was not abolished till 1832. The latest existing institutions of this class were at Toulon, Brest, and Rochefort, at which the number of convicts, in 1850, was respectively 3873, 2831, and 986. In these establishments, the labor of the convicts was turned to profitable account, and the various handicrafts were taught in the prison under the direction of overseers. The industrious and clever were enabled to earn small wages, and good behavior was rewarded with a gradual relaxation of restraint. Formerly the punishment of the galleys was inflicted for comparatively slight offenses, such as removing landmarks, begging, poaching, etc., but hard labor in the B. was reserved exclusively for such as commit crimes which seriously menace the public peace and personal safety. The number of these, however, is not less than 51. Of 7689 convicts (*forçats*) in 1850, 3070 were condemned to 5 to 10 years; 2239 to 11 to 20 years; 282 to 20 to 30 years; 41 to 30 to 40; 23 to 40 to 50; 9 to above 50; and 1965 for life. The principal crime was theft, for which 4750 had been condemned; for murder, 1027. The greater proportion of the criminals, viz. 4595, were from the rural districts; from towns, 2452; foreigners, 643; most of them were of the age between 20 and 40; and 3902 were unable to read or write. The most numerous class were husbandmen, threshers, gardeners, 1278; next, day-laborers, and *terrassiers* (navvies?) 1078. The number of pardons to convicts in 1848 was 90; in 1849, 52. In 1852, the imperial government decreed the suppression of the B., and substituted in their place deportation to Guiana. But in case any of the prisoners then in the B. might have considered deportation a greater punishment than what they were condemned to, it was resolved to give them the choice of remaining in prison or of being transported: 3000 chose transportation.

BAGNES-LE-CHABLE, a parish and village in the canton of Valais, Switzerland, on the left bank of the Dranse. The parish occupies the whole valley of the Bagne. Pop. '70, 4254. The valley was twice inundated during the 16th c.; again in 1818, when 400 cottages were swept away, and 34 lives lost.

BAG'NI DI LUC'CA (*Baths of Lucca*), a large inland village of Italy, in the province of Lucca, and 13 m. n. of the city of Lucca. Pop. of commune about 8200. It is one of the most frequented bathing-places in Italy, and is situated in one of the finest valleys of Tuscany, the valley of the river Lima, a branch of the Serchio. There are hot springs of various temperature from 96° to 136° Fahr., scattered over a limited neighborhood.

BAGNO A RIPOLI, a famous Italian bathing-place, in the province and circle of Florence, 5 m. e.n.e. from the city of Florence.

BAGNO IN ROMAGNO, a t. of Italy, in the province of Florence, and 35 m. e. by n. from Florence city, on the right bank of the Savio, not far from its source. It is a much frequented bathing-place, having hot springs of temperature 108° to 110° Fahr.

BAGNOLES, a summer resort in France, 13 m. s.s.e. of Domfront; noted for mineral springs and baths. The village is nearly 200 years old, and has recently been greatly improved and adorned.

BAGNOLO, a t. of Piedmont, in the province of Cuneo, 12 m. n.w. from Saluzzo, on the left bank of the Grana, at the foot of the Alps.—Another small t. near Brescia bears this name; also a t. in the province of Reggio, in Emilia; and a t. in the province of Lecce, in s. Italy, as well as many villages in Italy.

BAGO'AS, an Egyptian eunuch in the service of Alexander Ochus of Persia, who aided that monarch in conquering Egypt; but the sacrilegious treatment of the sacred objects by Alexander so offended him, that on his return to Persia he poisoned the king, and killed all the sons except Arses, the youngest, whom he placed on the throne. This boy soon displeased B., and was poisoned to exalt Darius Codomannus. B. tried to dispose of the last named by poison, but was detected and poisoned himself about 336 B.C.

BAGOT, a co. in the central part of the province of Quebec, Canada, e. of Yamaska river, intersected by the Grand Trunk railroad. Black limestone and copper are among its products. Capital, St. Liboire. Pop. '71, 19,491.

BAGOT, Sir CHARLES, 1781–1843; an English diplomatist; under secretary of state in 1807; special envoy to France in 1814; ambassador to Russia in 1820, and to Holland in 1824. In 1841, he was appointed governor-general of Canada, and died in office.

BAGPIPE, a wind instrument, which, up to the 18th c., was common in almost every country in Europe, and still continues in use among the country people in Poland, Italy, Sicily, the s. of France, Scotland, etc.; but being far from a sweet-toned instrument, and limited in its range of notes, it has fallen into disuse wherever there is any pretension to musical refinement. It consists of a leathern bag, which the player inflates by blowing with his mouth through a tube. The music proceeds from three or four pipes, whose mouthpieces are inserted into the bag; the wind being forced out by pressing the bag under the arm. One of the pipes, the *chanter*, is a kind of oboe with eight holes, and is similarly handled; the others, called *drones*, sound each only one continuous low note. It is certain that the bagpipe was in use among the Hebrews and Greeks, and there are plenty of proofs that in Germany and elsewhere in Europe it was among the most favorite instruments in the 15th century.

Though fallen generally into disuse, the B. is still a popular instrument in the Highlands of Scotland, and wherever there are gatherings of Highlanders, and even of Lowland Scotch, in England and other countries. Pipers in proper costume are also attached to the Highland regiments, and in some instances pipers are retained by Scottish noblemen to play on festive occasions. Skill in playing the B. is promoted by various Highland societies, which, at periodical competitions, give prizes to the best players of pibrochs (q.v.), reels, and other airs.

BAG'RADITES, or BAGRATIDES, a royal house of Georgia and Armenia, founded by Bagrad; its members were permitted to crown the kings of Armenia. They became Christians at the beginning of the 4th century. The Bagdad caliphs made several of the B. governors of Armenia. The dynasty maintained their independence until the occupation of the country by Russia.

BAGRATION, PETER, Prince, a distinguished Russian general, descended from the noble family of the Bagradites of Georgia and Armenia, was b. in 1756. He entered the Russian service in 1783, and was trained under Suwarrow. In 1788 he was engaged at the storming of Oczakow; fought in 1792 and 1794 against the Poles; in 1799, in Italy and Switzerland; and distinguished himself in the Austro-Russian war of 1805 against the French, especially in the sanguinary engagement of Nov. 16 of that year, when, with a small body of troops, he bravely stood during six hours opposed to the superior forces under Murat, and thus enabled the Russian general, Kutusow, to reach Znaym with the main army. Subsequently, prince B. was engaged in the battles of Austerlitz, Eylau, and Friedland, and took a part in the Russian campaign against the Turks, especially in the battle of Silistria, 1809. In the campaign of 1812, he commanded the second Russian army of the west, and had the misfortune to fail in his attack on Davoust near Mohilew; but succeeded in forming a junction with the west army at Smolensk. He was, however, mortally wounded in the battle of Mosaisk, and died Oct. 7, 1812.

BAGSHOT BEDS, the lowest series of strata in the middle eocene formation of Britain. The name is derived from Bagshot heath in Surrey, where they were first examined; but, as they are more fully developed and better seen in the isle of Wight, the rocks there are now considered the typical representatives of the series. The strata are arranged into four groups: 1. The *Upper B. B.*, composed of yellow and white sands with ferruginous stains, generally unfossiliferous, though a remarkable exception exists at Whitecliff bay, Isle of Wight, where a bed contains a large number of very friable shells. 2. The *Barton beds*, consisting of colored clays interstratified with sand and loam. They are rich in fossils, chiefly the shells of mollusca, but contain also the remains of a fish and several reptiles. Here, too, the nummulite (q.v.), so characteristic of the tertiary formations, makes its first appearance in a descending order. This genus dies out with the *nummulites variolaris*, the small species found in these beds. 3. The *Bracklesham beds*, so called from their extensive development at Bracklesham bay, near Chichester in Sussex, are composed of marly clays and white sands, capped by a bed of flint-pebble conglomerate, and resting on dark carbonaceous clays. This is the most highly fossiliferous group in the series. Two species of plants have been noticed. The remains of 6 reptiles and 21 fishes have been described, besides a long list of mollusca, amongst which is the magnificent *cerithium* (q.v.) *giganteum*, so conspicuous in the *calcaire grossier* of Paris, where it is sometimes 2 ft. in length. The prevalence of genera now only known as inhabitants of tropical or sub-tropical seas, such as volutes and cowries, together with their companion lunulites and corals, makes it highly probable that a warm climate prevailed during the deposition of these strata. 4. The *Lower B. B.*, consisting of alternations of variously colored sands with gray, chocolate-colored, or white pipe-clays. The white clays contains the only fossil organisms found in this group—beautifully preserved leaves spread out in the layers of the clay.

The series rests on the true London clay. Its maximum thickness is about 1200 feet

BA'GUL, or BHA'GUL, a small state in n.w. India, on the s. or left bank of the Sutlej. B. is one of the native states in feudal subordination to the Punjab government. Pop. estimated, '72, at 22,000. Its lat. is about 31° n., and long. 77° e. The surface is generally mountainous, presenting two summits, Bahadurgarh and Bara Devi, respectively 6233 and 7003 ft. above the sea. B. has a supposed gross revenue of £6000, pays 3600 rupees as tribute, and has 222 men under arms.

BAHA'MAS, or LUCAY'OS, a chain of islands stretching in a n.w. direction from the neighborhood of the n. coast of Hayti to that of the e. coast of Florida. From Florida they are separated by the channel through which flows the gulf stream (q.v.); and from Cuba, by the old Bahama channel. These are the principal passages between the open ocean and the gulf of Mexico. The chain extends in n. lat. from 20° 55′ to 27° 31′, and in w. long. from 72° 40′ to 79° 5′, having an entire length from n.w. to s.e. of about 550 m.; and it rests mainly on two shoals—the Great Bank to the s., and the Little Bank to the n. There are upwards of 3000 islands and rocks, but only about 30 of any size. The chief members of the group, if reckoned from the n.w., are these: Great Bahama; Abaco; Eleuthera; New Providence; Andros; Guanahani or Cat island, or San Salvador; Watling's island; Exuma; Long island; Crooked islands; Maricuana; Inagua; Little Inagua; Caicos; Turk's island.

The area is 3021 sq.m.; and in 1871 the pop. was 39,162. The pop. of Turk's island, officially separate from the B., is 4723. The revenue of the B. in 1874 was £36,573; the expenditure, £36,627. The value of the total imports in 1873 was £226,306; of the exports, £156,613. The islands generally are of reef-like shape, long, narrow, and low. With very little appearance of soil, they derive considerable fertility from the tendency of the porous rock to retain moisture. Besides excellent pasturage, they yield guinea-corn, maize, cotton, pine-apples, lemons, oranges, pimento, and a species of cinnamon. In the larger islands, too, there is excellent timber. Cotton cultivation received a great impulse during the American civil war. During the summer, the temperature ranges from 73° to 93° F.; but in the winter the climate is so delightfully temperate as to be generally prescribed in the United States for pulmonary complaints. The annual fall of rain is from 43 to 45 in., being heaviest in Oct., Nov., and Dec., but pretty equally distributed over the other months. On Oct. 1, 1866, a furious and most destructive cyclone visited the Bahamas.

The B. were Columbus's earliest discovery. But the precise spot of his first landing has not been ascertained. Guanahani or Cat island has generally been believed to be the San Salvador of Columbus; but recent investigations appear to have transferred the honor to Watling's island, situated a little further to the east. The B. having been depopulated, but not again colonized, by the Spaniards, were occupied by the English in 1629—to whom, after various vicissitudes of fortune in the wars with Spain and France, they were ultimately secured by the treaty of 1783. Nassau, in New Providence, is the seat of government, and has recently been greatly improved both as town and port. During the American civil war, Nassau became the station for vessels about to run the blockade of the southern ports, and thence derived unexampled prosperity; and so far as agriculture is concerned, the impulse then received has been maintained by the Bahamas.

BAHAR' (also spelt *Behar* and *Bihar*), one of the old Mohammedan provinces of India, occupying part of the valley of the Ganges, and named after its chief town, a city which in 1872 had a pop. of 44,295. B. is now one of the provinces of lower Bengal, and is divided into the two commissionerships of Patna and Bhagulpore, which are again subdivided into 12 administrative districts. The area of the province is 42,417 sq.m., and the pop. (1872) 19,736,101, giving an average of 553 persons to the sq. mile. The name B. was also given to one of the administrative districts, now officially called Gayah. Roads and bridges can neither be well made nor thoroughly repaired, where, during nearly half the year, the surface of the country is inundated, and torn by innumerable torrents. In the dry season, the beds of the rivers present only detached pools. Among the minerals, the most important are coal and mica. The latter, nearly as pellucid as glass, is sometimes found in blocks, yielding plates of 36 in. by 18. Potatoes, cabbages, cauliflower, lettuces, turnips, etc., have been introduced from Europe, and succeed well. Of indigenous productions, the most considerable are rice, pulse, sugar, cotton, indigo, and tobacco. The district is largely engaged in the manufacturing of muslins, silks, carpets, blankets, tents, tapes, threads, ropes, paper, glass, cutlery, jewelry, leather, ink, soap, and pottery. Ardent spirits, too, are extensively distilled from the flowers of the *bassia latifolia* (q.v.). Before the days even of Moslem domination B. appears to have been the center of a Hindu empire, which native accounts describe as of matchless splendor, and of fabulous duration.

BAHAR', or BEHAR, a t. of Bengal, 34 m. s.e. by s. from Patna, the chief t. of a British district of the same name (see BAHAR). According to the census returns of 1871, it contains a pop. of 44,295. The original city is nearly deserted, and the present town consists of houses scattered about its remains, and interspersed with fields, gardens, and groves. There are some remains of fine mosques. The ruin of this town began with its sack by the Mahrattas about 1742, and was completed by famine some years after.—The present district of Bahar is but a small portion of the great province which was called by that name in the empire of Delhi.

BAHI'A, capital of the Brazilian province of the same name. It is otherwise called San Salvador—the more usual term being taken from *Bahia de Todos-os-Santos*, or *bay of All Saints*, on which it is situated, in lat. 13° 1′ s., and long. 38° 32′ w. B. contained, in 1874, 152,000 inhabitants, pretty equally divided between whites, blacks, and mulattoes. B. has an exchange, arsenal, and imperial dockyard, besides many ecclesiastical

and public institutions; and is the point of departure for a railway line. It is connected by submarine telegraph with Pernambuco, Para, and Rio. The value of imports of foreign goods into B. in 1874, was £1,455,985; and the value of exports in the same year, £1,384,349. The chief exports of B. are sugar, cotton, coffee, tobacco, rice, rum, dye-stuffs, fancy woods, cocoa-nuts, horns, hides, diamonds, and bullion; and it imports manufactured goods, provisions, flour, salt, iron, glass, and wines. B. is the oldest city in Brazil, having been founded by the first captain-general of the country, and was long the capital of the colony. As a port, B. is unrivaled.

BAHI'A, a province of Brazil, about the middle of the coast, taking its name from its chief city. It extends in s. lat. from 10° to 16°, and in w. long. from 37° to 44°. Pop. in 1873 was 1,450,000. The wealth of B., consisting in valuable timber, in rich mines of gold, silver, copper, lead, iron, in deposits of potash, alum, etc., is in great measure lost for want of good roads. The interior contains lofty sierras; but the maritime districts are fertile, being well watered by the Itapicuru, Contas, and other rivers. Besides the streams that flow through B., the San Francisco, a vastly larger river, forms about half of the inland boundary, dividing this province from that of Pernambuco.

BAHI'A HON'DA, a harbor on the n. coast of Cuba, 60 m. w.s.w. of Havana, protected by a fort, and formerly much resorted to by privateers and slavers.

BAHNA'SA, or BEHNE'SEH, a t. of central Egypt, on the Bahr Yousef (Joseph's canal). It is noteworthy as the site of the ancient *Oxyrynchus,* celebrated for its numerous monasteries, the ruins of which are still to be seen.

BAHR, an Arabic word signifying a large body of water, is applied both to lakes and rivers.—BAHR-EL-ABIAD (the White river), and BAHR-EL-AZRAK (the Blue river), are the chief branches of the Nile (q.v.).—BAHR-ASSAL is lake Assal (q.v.).—BAHR-BELA-MA (the Sea without Water), a long, deep valley in the desert w. from Cairo. It is completely barren, but has the appearance of having been once a watercourse.

BÄHR, JOH. CHRISTIAN FELIX, an eminent German philologer and critic, was b. 1798, at Darmstadt. He was educated at the Heidelberg gymnasium and university, where he gained the favor and friendship of Creuzer, whose symbolic system of interpretation in mythological matters he himself pursued at a later period. He was elected a professor in 1826. Previous to this, he had occupied himself chiefly with the elucidation and criticism of Plutarch, the result of which was an annotated edition of *Alcibiades* (Heid. 1822), and of *Philopoemen, Flaminius, Pyrrhus* (Leip. 1826). At the same time, he collected and published the fragments of Ctesias. But a greater interest was excited by his *History of Roman Literature* (1828), which is noted for its clearness and comprehensiveness. Three supplements to this work also appeared: *The Christian Poets and Historians of Rome* (1836), *The Christian-Roman Theology* (1837), and the *History of Roman Literature in the Carlovingian Period* (1840). One of his most important works is his version of Herodotus 1832–35. In 1835, he published his *De Universitate Constantinopoli Quinto Sæculo Conditâ.* He likewise contributed numerous articles to Jahn's *Jahrbücher für Philologie,* and other works. He d. 27th Nov., 1872.

BAHRDT, KARL FRIEDRICH, a German theologian of the extreme skeptical school, was born, 1741, at Bischofswerda, in Saxony, and studied at Leipsic, where he soon displayed extraordinary talents, and some restlessness of disposition. His early theological writings betrayed the skeptical tendencies which were afterwards more fully developed. On account of his immoral conduct, however, he was, in 1768, compelled to leave Leipsic, where he had been a popular preacher. In Erfurt, his next residence, he was appointed professor of philosophy and Hebrew antiquities, and wrote *Letters on a Systematic Theology,* and *Aspirations of a Mute Patriot,* two works whose heterodoxy involved him in controversies, and made his position untenable. In 1771, he went to Giessen, where he delivered theological lectures, and preached with approbation. His translation of the New Testament was regarded as so dangerous, that the author was deprived of the privilege of teaching. His creed, in fact, was simple deism, and one of the chief points in his theology was his rejection of miracles. Even the immortality of the soul was not positively maintained in his works. Ultimately, after attempting to establish various institutions, he was reduced to the position of a tavern-keeper; and as he still persevered in his attacks on orthodoxy, he was imprisoned for one year at Magdeburg, where he wrote an autobiography. Among his other works are *The Religious Edict* (a satire on the Prussian religious edict of 1788), and *The German Union.* He died at Halle, April 23, 1792.

BAHRDT, KARL FRIEDRICH, D.D., 1741–92; a German professor of theology, whose attacks upon orthodoxy and the clergy resulted in a year's imprisonment at Magdeburg. He contested the authority of miracles, and was in every way a severe critic of Scripture. His conduct was notoriously irregular; at one time he lectured on moral philosophy in the forenoon, and in the afternoon officiated as landlord of a public house.

BAHREIN' ISLANDS, or AVÂL ISLANDS, a group of islands lying in the Persian gulf. The most important of these is Bahrein, or Avâl, about 27 m. long, and 10 broad. It is hilly in the center, but the soil generally is fertile, and produces dates, figs, and other eastern fruit, besides wheat and barley. Bahrein is badly cultivated.

Spring-water is plentiful in the interior, but on the coast it can only be procured from the bottom of the sea, where it springs up quite fresh, and is brought up by divers in skins. Manama, the capital, in lat. 26° 12′ n., and long. 50° 39′ e., has a good harbor on the n., but a safer though smaller one on the south. The B. I. are chiefly remarkable for their pearl fisheries, which were known in ancient times, and which employ, during the season, from 2000 to 3000 boats, each manned with from 8 to 20 men. The annual value of the pearls is estimated at from £200,000 to £300,000. Tortoise-shell, shark-fins, and dates are also articles of export. The islands, which have been subject to a good many political changes, are now inhabited by Arabs. Pop. 68,000.

BAI'Æ, a small t. of antiquity, on the coast of Campania, 10 m. w. of Naples, where the present castle of Baja stands. When the Roman empire was in its greatest splendor, the beauty of its situation, the fineness of the surrounding scenery, and the excellence of its mineral springs, made B. such a favorite resort of the Roman nobles, that for want of space for their baths, and villas they encroached on the sea. Julius Cæsar, Piso, Pompey, Marius, Julia Mammæa, and others, had country-houses at Baiæ. Horace preferred B. to all other places in the world. Seneca warned every one who desired to maintain dominion over his passions, to avoid this watering-place. Cicero thought it necessary to excuse himself for undertaking the defense of Marcus Cœlius, a man who had often visited B., for B. was considered by the stricter moralists of those times as the abode of voluptuousness and luxury, and a den of vice. The ruins, still standing on the desolate coast, or rising from the sea, are now the only evidence of the former magnificence of B., whose population, dwelling in mean hovels, only amounts to 800. The ruins of three supposed temples—one of Venus, one of Mercury, and one of Diana Lucifera—as well as the remains of a few *thermæ*, or warm baths, still attract the attention of archæologists. The harbor, one of the largest belonging to the Romans, is now much destroyed. The surrounding country is covered with the ruins of Roman villas, sepulchral monuments, and other buildings.

BAI'KAL (in Turkish, Bei-kul, i.e., Rich Lake) is, after the Caspian sea and the sea of Aral, the largest lake of Asia. It is a fresh-water lake, and is situated in the s. of Siberia, in the gov. of Irkutsk, near the great military road between Moscow, Kiachta, and the mines of Nertschinsk. Lat. 51° 20′ to 55° 30′ n., long. 103° to 110° e. It somewhat resembles a sickle in shape, and varies considerably in breadth. Between the mouths of the Selenga and the Buguldeicha, it is only 19 m. across. Its length is 370 m., and its breadth 20 to 70 m.; height above the sea, 1363 ft.; depth in center very great. The Baikal mountains, a spur of the Altaï, inclose the lake, which is fed by numerous streams, the chief of which are the Selenga and Bargusin. Its outlet is by the lower Angara, a chief tributary of the Yenisei; but the river is inconsiderable in size compared to those which flow into the lake. It has several islands, the largest of which, Olkon, has a length of 30 miles. B., which forms an important link in the chain of communication between Russia and China, has two commercial ports, and of recent years, steamboats have given a considerable impetus to its trade. Its sturgeon and seal fisheries are valuable, and large quantities of a fish resembling a herring are also caught in it. A peculiar fish, called the golomynka (*callionymus baicalensis*), which is almost one mass of fat, yielding beautiful train-oil, was at one time caught in immense numbers, but it is now much scarcer. The surface of the lake is frozen from Nov. to April, but the traffic is carried on over the ice. Besides the Russians settled on the banks of the Selenga and Angara, the shores of lake B. are also inhabited by tribes of the Burates and Tunguses.

BAIKIE, WILLIAM BALFOUR, 1824–63; a native of the Orkney islands. He joined the British navy, in which his father was a captain, and was made surgeon and naturalist to the Niger expedition in 1854. The senior officer died before reaching Africa, and B. took command. He explored the Niger for 250 m. in a small steamer, making a voyage of 118 days. In 1857, he was in a second expedition, the vessel of which was wrecked, and all except himself returned to England. He remained and settled for a time, with none but native assistants, at the confluence of the Benue and the Quorra. He formed a sort of commonwealth, in which he was not only a ruler, but teacher, priest, and physician. Within five years he opened the Niger to navigation, made roads, and established a market for the native trade. He studied and made vocabularies of nearly 50 native dialects, and translated into Housa portions of the Bible and prayer book. Only once during his residence was he compelled to use armed force against the surrounding tribes.

BAIL is a technical term in the practice of the law both in England and Scotland, with this difference, that, in England, it is used both in civil and criminal procedure, whereas in Scotland it is applied exclusively to the latter. By B. is understood the security given by sufficient sureties for the appearance in court on a day, and at a place certain, of a person arrested or imprisoned, and who, in consequence of such security or B., is in the meantime set at liberty. Such security, however, involves the assumption of the custody of the arrested or imprisoned party by his B., the meaning of the rule being that the party arrested or imprisoned is delivered into the hands of those who bind themselves for his forthcoming, in order that he may be protected from prison until he has to make his personal appearance; and in this sense, it differed from the old term, *mainprize*, now obsolete, and which signified a mere security without any other or corresponding guarantee, as in the case of bail. A technical and necessary distinction

is taken in law-books between what is called *common B.*, or *B. to render to prison*, and *special B.*, or *B. to the action;* but for general information, the following statement of the law may suffice.

In civil process, the sureties give their bail-bond to the sheriff himself for the appearance of the defendant, according to the exigency of the case, and for nothing else. It does not appear that any particular or limited number of sureties is to be taken; but it would seem that the sheriff may insist on more than two, provided they have only sufficient property within the county to answer the penalty; but if more than two be tendered, it is not necessary that each should be worth the full amount. On the other hand, the bail-bond will be good though there be only one surety; but in accepting such security it would seem that the sheriff does so at his own risk. If there is reasonable ground for believing the sureties to be sufficient, the sheriff has no discretion, but is bound to accept the B.; and if he refuses to do so, he is liable to an action.

The necessity of B., however, may be avoided by the defendant availing himself of the provisions of statutes which are re-enactments of older laws, by which it is enacted that the arrested or imprisoned party may obtain his immediate discharge by depositing with the sheriff the sum demanded by the plaintiff, together with £10 towards the cost, the same to remain in court to abide the event of the suit. The enactment, however, contains a proviso that it shall be lawful for a defendant who has made such deposit in payment, at any time in the progress of the cause, before issue joined, or final or interlocutory judgment, to receive out of court the sum so deposited and paid, upon putting in and perfecting special B., and paying such costs as the court shall direct; and, by another enactment of the same statute, provision is made for the case where a defendant who has put in B., afterwards elects to deposit the plaintiff's demand, and to pay the costs to abide the event of the action.

As to those who may or may not be B., it would appear, from the nature of the security undertaken, that persons privileged from arrest cannot be B., because the engagement on the part of the B. being, in default of the principal party, to pay the debt or damages and costs, the plaintiff is entitled to require the security of persons who are amenable to the ordinary process of the courts. Therefore, peers, members of parliament, ambassadors, and other privileged persons, cannot become B.; nor, generally, can attorneys or those employed in executing the process. But persons who are not in such a position, but who are either housekeepers or freeholders, may be taken as B. The possession of *leasehold* property is not enough, unless the party is also a housekeeper; but the real owner of a *freehold* estate, however small it may be, situated within the jurisdiction of the court, and provided he can otherwise make up the amount required, is qualified, though he be only a lodger, or merely an occupant by sufferance in the house of another. Again, to constitute a "housekeeper," within the meaning of the rule, the house must be within the jurisdiction of the court, and such a party must be the *bonâ-fide* tenant of the house in his own right, enjoying its benefits and bearing its burdens. A person, therefore, in lodgings in England, but with a house in Scotland, is not admissible as B.; and such B. must strictly in this sense be a *housekeeper*. B. has ceased to be usual since imprisonment for debt was abolished.

Besides these arrangements of the common law with regard to B., we may mention two other forms of it—namely, B. *in error*, and B. *in attachment*. The former is regulated by the common law procedure act (1852), 15 and 16 Vict., c. 76, by section 151 of which it is provided that proceedings in error shall not stay or delay execution on a judgment, unless the person alleging or pleading such error shall be bound, along with two sufficient sureties, in double the sum recovered by the judgment, in order to prosecute the proceedings in error with effect, and make payment of the costs, in the event of the judgment being affirmed, or the proceedings in error being discontinued. B. in attachment, again, signifies the sureties required for a party arrested upon a writ of attachment, and brought up before a judge in order to obtain his discharge from custody, the sureties undertaking that he shall appear and answer such interrogatories as may be required of him. This, however, only applies to attachment in the case of *contempt* of court; for it would appear that an attachment for the non-payment of money, or the non-performance of an award, is not bailable. In the court of chancery, also, there are rules for accepting B.; as, for instance, for a defendant against whom attachment has issued for his contempt in not making appearance to the plaintiff's suit; but an attachment for non-performance of a decree in chancery is not a bailable process.

In criminal procedure, the subject of B. is at present regulated by the 11 and 12 Vict. c. 42, which provides that if the justice or justices, before whom a prisoner is brought, shall be of opinion that the evidence against the prisoner be sufficient, or even if it raise a strong or probable presumption of his guilt, they shall either commit him to prison, or admit him to B.—that is, allow him to be discharged on entering into a recognizance—with some sufficient surety or sureties—to appear and surrender himself to custody, to take his trial on such indictment as may be found against him, in respect of the charge in question, at the next assizes or sessions of the peace. The crime of treason, however, is not a bailable offense, except by order of a secretary of state, or by the court of queen's bench, or by a judge thereof in vacation. But justices are bound to admit to B. in all cases of misdemeanor, excepting in the case of a misdemeanor in receiving property stolen or obtained by false pretenses, etc., or the case of any misdemeanor for the

prosecution of which the costs may be allowed out of the county rate, as to all which misdemeanors, as well as in all felonies—treason excepted—justices and magistrates have a discretionary power either to admit to B. or to commit to prison. The court of queen's bench exercises a paramount jurisdiction, and can bail in all cases whatsoever; but it is not usual for that court or for justices or magistrates to admit to B. in any case of felony, except under circumstances of a special and favorable kind.

In Scotland, the term B., as we have mentioned, is only used in the proceedings in the criminal courts; and there the general distinction is taken between offenses that are capital and not capital, the former not being bailable except by order of the high court of justiciary, who exercise a power in this respect analogous to the jurisdiction of the court of queen's bench; offenses that are not capital being bailable by magistrates, sheriffs, or other competent judges. In the *civil* process of the Scotch courts, the term corresponding to B. is CAUTION (q.v.).

BAIL (*ante*) in the United States is substantially the same as in England. One who becomes surety for another is his B. "B. above" are sureties who agree either to satisfy the plaintiff as to his claims and costs, or in case of judgment against a defendant, to deliver him up. "B. below" are sureties for the defendant's appearance, or that he will give bail. "Civil B." is taken in civil actions; "common B." amounts to entering an appearance when fictitious sureties are named; "special B." applies to cases in which there are responsible sureties. B. may be given in all cases of arrest in civil action. It is a general rule that a person held to B. in a civil case cannot be held a second time for the same cause of action, unless in another state. In criminal cases, except capital crimes, the defendant may generally be admitted to B., and even in the higher crimes B. may be accepted in the discretion of the court, or in the absence of legal provision to the contrary. In any case of offense against the nation, not punishable with death, any United States judge or state judicial officer may take B.; but if the punishment be death, only a United States judge can decide upon B. The form of entering B. is the same in the several states as in England. Mitigation of excessive B. is usually obtained by application to the court; and the exaction of such B. is forbidden by the federal constitution. The power of sureties over the person bailed is wide. They are technically his jailers, and may arrest him anywhere, or at any time, even on Sunday, or in the attendance at court; they may command assistance, and may depute their power to another. Refusing or delaying B. is an offense against personal liberty, but is not actionable unless malice can be shown. Sureties must in most cases be citizens and freeholders, or possessed of means that will satisfy the court.

BAIL COURT is the name given to a new and supplementary tribunal at Westminster, called into existence by the 11 Geo. IV. and 1 Will. IV. c. 70, by which, after providing for the appointment of an additional puisne judge in each of the three courts of common law, it is made lawful for any one of the judges of either of these courts, when occasion shall so require, where the other judges of the same court are sitting in banc (see BANC), to sit apart from them for the business of adding and justifying special bail, discharging insolvent debtors, administering oaths, receiving declarations required by statute, hearing and deciding upon matters in motion, and making rules and orders in causes and business depending in the court to which such judge shall belong, in the same manner and with the same force and validity as may be done by the court sitting in banc.

This statute has been hitherto acted on only by the court of queen's bench, wherein one of the judges sits from time to time in the B. C. for the purposes above specified. It may be remarked that a rule of the B. C. cannot be re-opened in the full court after the term in which it is made, even though the judge who pronounced it sanctions the application; and a judge sitting apart, under the authority of the statute, has equal authority with the full court to reverse the decision of a judge sitting at chambers. See Lush's *Practice* by Stephen.

BAILEE'. See BAILMENT.

BAILEN, a t. in Spain, 24 m. n.n.w. of Jaen; pop. 7831; probably in or near the site of ancient Bæcula, where Scipio defeated Hasdrubal in 269, and Masinissa in 206 B.C. Near B. was fought the great battle of Navas de Toloso, in 1212, when the Spaniards broke the power of the Moors, who are said to have left the incredible number of 200,000 of their dead on the field, with a loss of only 95 Christians. Here, July 23, 1808, the French gen. Dupont capitulated, surrendering 17,000 men to the Spaniards —the first great disaster to the French arms in the peninsular war. There is a ruined castle here, formerly belonging to the counts of Benavente, but now to the Osuna family.

BAILEY, derived through the French *baille*, from the middle-age Latin BALLIUM, which is a corruption of the Lat. *vallum*, a rampart. The B. was the whole space inclosed within the external walls of a castle, with the exception of that covered by the keep. This space was variously disposed of, and, of course, differed greatly in extent. Sometimes it consisted of several courts, which were divided from each other by embattled walls, so as to form a series of fortifications. When these courts were two in number, they were known as the outer and inner bailey. The entrance to the B. was

generally by a draw-bridge over the ditch, and through a strong machicolated and embattled gate. The B. was often of great extent, containing the barracks for the soldiers, lodgings for workmen and artificers, magazines, wells, chapels, and sometimes even a monastery. In towns, the B. had even a wider signification, and was often retained after the castle or keep had long disappeared, as in the case of the Old B. in London, and the B. in Oxford.

BAILEY, GAMALIEL, 1807–59; b. N. J.; studied medicine in Philadelphia, and graduated in 1828; visited China as ship's physician; was editor of the *Methodist Protestant* in Baltimore; with James G. Birney started, in 1836, the *Cincinnati Philanthropist*, an abolition journal. His press was destroyed by a mob, but he continued the paper until 1844. In 1847, he began in Washington the *National Era*, which was mobbed in the next year, but not suppressed. Wanting a story for his paper, Dr. B. inclosed 100 dollars to Harriet Beecher Stowe, asking her to send him something. She sent one of the chapters of *Uncle Tom's Cabin*, without the remotest idea of the stupendous fame it was to achieve. Dr. B. died at sea while on the way to Europe for the benefit of his health.

BAILEY, JACOB WHITMAN, 1811–57; a naturalist, graduate of West Point military academy, and lieut. of artillery; professor of botany, mineralogy, and chemistry in the academy in 1839, winning much distinction for microscopical researches, and publishing a volume of illustrations. He made a collection of 3000 objects, marked and catalogued; and of algæ he gathered 4500 specimens. These, with his books, went to the Boston society of natural history. He was president of the American association for the advancement of science in 1857, in which year he died. His health, never very strong, was broken by exposure while rescuing his wife and daughter from the steamboat *Henry Clay*, burned on the Hudson river five years before.

BAILEY, PHILIP JAMES, a distinguished living poet, was b. at Basford, in the co. of Nottingham, in the year 1816. His early education was conducted in his native town, and afterwards he became a student at the university of Glasgow. He was called to the English bar in 1840, but never practiced. The first edition of *Festus*, the poem by which he is best known, was published in 1839, and has in subsequent editions received a large amount of new matter. It attracted considerable notice in England, and was in America assailed by a perfect tornado of applause. While the enthusiasm lasted, Mr. B. was in certain quarters mentioned in the same breath with Shakespeare, Milton, and Goethe. This injudicious admiration was, however, certain to cool down, and to prove more prejudicial to the real interests of the author than unmerited censure itself; consequently, in literary journals, *Festus* is frequently mentioned with a contempt which it is far from deserving. It is a wonderful work, when the age of the author at the period of its production is taken into account. It was commenced before the author had reached his 20th year, and completed in three years. *Festus* errs from excess of boldness. Mr. B. speaks of universes as other poets speak of buttercups. He has the *entrée* to the highest heaven and to the regions of penal fire. He is on terms of perfect familiarity with eternity. He lays his scenes in the "center," "elsewhere," "everywhere," "nowhere." Despite its extravagance, *Festus* is full of poetical thought and felicitous expression, and has occasional dashes of grim humor in it, not unworthy of Goethe's mocking fiend himself. The faults of the poem are as great as the beauties; there is no congruity or proportion in it, and you lay it down with a sense of admiration qualified with disgust. In 1850, Mr. B. published the *Angel World*, which possesses all the faults and all the beauties of the former work on a reduced scale. If the reader's admiration is less, his disgust is less. The *Angel World* is now incorporated with the larger work. Mr. B.'s subsequent writings have been the *Mystic*, the *Age*, a colloquial satire, and the *Universal Hymn* (1867). The first production is in the writer's early style, with all the beauties deleted. But whatever measure of success may attend Mr. B. in "elsewhere," and "nowhere," complete failure awaits him when he deals with mankind and the ordinary affairs of earth.

BAILEY, SAMUEL, a writer on politics, political economy, mental philosophy, and other subjects, was b. in 1791 in Sheffield, where afterwards he became a banker. He d. Jan. 18, 1870, leaving £90,000 as a bequest to the town. His works are: *Essays on the Pursuit of Truth and on the Progress of Knowledge* (1821); *Questions for Discussion in Politics, Political Economy, and other Departments of Knowledge* (1823); *A Critical Dissertation on the Nature, Measures, and Causes of Value* (1825); *A Letter to a Political Economist, occasioned by an Article in the Westminster Review on the Subject of Value* (1826); *Essays on the Formation and Publication of Opinions* (1829)—a sequel to his work on the *Pursuit of Truth;* *A Discussion of Parliamentary Reform* (1831); *The Rationale of Political Representation* (1835); *The Right of Primogeniture Examined* (1837); *Money and its Vicissitudes in Value* (1837); *A Defense of Joint-stock Banks and Country Issues* (1840); *A Review of Berkeley's Theory of Vision* (1842); *A Letter to a Philosopher in Reply to some Recent Attempts to Vindicate Berkeley's Theory of Vision* (1843); *The Theory of Reasoning* (1851); *Discourses on Various Subjects, Literary and Philosophical* (1852); *Letters on the Philosophy of the Human Mind* (three series, 1855, 1858, 1863); *On the Received Text of Shakespeare's Dramatic Writings, and its Improvement* (2 vols., 1862, 1866).

Mr. B.'s works on the *Pursuit of Truth* and the *Publication of Opinions* gave a great impetus to liberal and advanced views. His writings generally are distinguished by independent thinking, logical precision, a careful English style, and warm aspirations for the improvement of mankind. His treatises on the mind, while abounding in original suggestions, expand and enforce the views of the school of Locke in metaphysics, and what is termed the doctrine of utility in morals.

BAILEY, THEODORUS, b. N. Y., 1805; a naval officer; midshipman in 1818; lieutenant in 1827; commander in 1849; captain in 1855; commodore in 1862; rear-admiral in 1866. He was in the service in the Pacific during the war with Mexico. In the civil war he was in command of the frigate *Colorado*, and led the right column of Farragut's fleet in the opening of the Mississippi and the capture of New Orleans. In 1867, he was placed on the retired list.

BAILEY, or BAILY, NATHANIEL, or NATHAN, d. 1742; an English lexicographer, whose dictionary, published about 1721, was far superior to any then extant, and which formed the basis of Johnson's great work. He was a school teacher at Stepney, and author of several educational works.

BAI'LIE, a Scotch term, with several legal applications. It chiefly, however, and popularly, signifies a superior officer or magistrate of a municipal corporation in Scotland, with judicial authority within the city or burgh. In royal burghs, the office is in some respects analogous to that of alderman in England. The chief magistrate of a Scotch corporation, called the *provost* (q.v.) and often one or more of the bailies, are, in virtue of their office, in the commission of the peace; and by the 6 Geo. IV., c. 22, bailies are exempted from serving on juries. There are also *bailies of regality* and *barony*, who are appointed by the *superior* or over-lord of the manor (q.v.), with limited powers fixed by the 20 Geo. II., c. 43. There is a B. for the sanctuary or abbey of Holyrood, appointed by the Duke of Hamilton as hereditary keeper, and having jurisdiction within the precincts. See ABBEY, SANCTUARY. The word B. was also formerly a term in the practice of Scotch conveyancing, and signified an officer who represented the seller, and who, as such, gave *seisin* or sasine (q.v.), or delivery of the lands sold to the buyer or his attorney; but by the changes and simplifications effected by recent legislation, the office of B. in this sense may be said to be virtually abolished; indeed, by the 21 and 22 Vict., c. 76, s. 1, called *The Titles to Land Act*, seisin itself, as a separate and independent documentary title, is declared to be unnecessary, and registration of the conveyance of the estate held to be sufficient.

BAI'LIFF in English, BAILIE in Scotch, BAILLI in French, and BALIO in Italian, are terms having a common origin—namely, the middle Latin *ballivus*, which is again connected with the older form, *bagalus*, or *bajulus*. Through all the changes of application they have undergone in the course of history, they have continued to agree in denoting an overseer of some kind—an officer exercising superintendence on behalf of some superior authority. At the Greek imperial court in Constantinople, the chief tutor of the imperial children was called bajulos. The same title seems also to have been given in Constantinople to the superintendent of the foreign merchants, who was appointed by the Venetians, and it may possibly be for this reason that the title balio came at length to be applied also to the Venetian ambassadors themselves. The title ballivus was introduced by the knights of St. John into the s. and w. of Europe, as the eight members of their chapter were called *ballivi conventuales*, whence also the name ballei, given to the circles into which the possessions of the order were divided. In France, the royal baillis were at one time commanders of the troops, administrators of the royal domains, and judges each in his district. In later times, the royal baillis were deprived of the two latter offices, and were consequently then called baillis d'epée only. Proprietors of estates, also, possessing supreme jurisdiction, appointed baillis to superintend these courts of justice. As very little knowledge was required for these situations, and as they might be purchased, they were held in little estimation; and in later times, the baillis became standing characters on the stage, held up to ridicule on account of their ignorance and their absurd pretensions, as well as for cheating and injustice. In England, the name B. was introduced in the reign of William I., to designate the superintendents of counties, which were called ballivæ.

BAILIFF, in English law, is a legal officer, and may be described as the keeper, protector, or superintendent of some duty or charge legally imposed on him. As officers of the law, bailiffs put in force arresting process, and they perform other duties within the co. or bailiwick required of them by the sheriff, who is their immediate official superior. In this sense bailiffs are either *bailiffs of hundreds*, or *bound bailiffs*. The duty of the former is to collect fines, summon juries, attend the judges and justices at the assizes and quarter sessions, and execute writs and process s in the several hundreds. *Bound* bailiffs, again, are officers usually joined by the sheriffs with the bailiffs of hundreds, and employed on account of their adroitness and dexterity. They are called bound bailiffs, because the sheriff, being civilly responsible for their official misdemeanors, they are annually bound in an obligation, with sureties, for the due execution of their office. There are also *special bailiffs*, who are officers appointed by the sheriff on the application of the party suing out the process to be executed; and whenever a party thus chooses

his own officers, he is considered to discharge the sheriff from all responsibility for what is done by him. There is, besides, another exceptional class of bailiffs, called bailiffs of *liberties*, honors, manors, and other lordships and franchises, whose appointments, duties, and responsibilities are regulated by the 7 Vict. c. 19. The co. courts likewise have bailiffs for the execution of their process, as to whom see 9 and 10 Vict. c. 95, 12 and 13 Vict. c. 101, 13 and 14 Vict. c. 61, and 19 and 20 Vict. c. 108.

The sheriff himself is the *Queen's B.*, and, as such, it is his business to preserve the rights of the crown within his bailiwick. He must seize to the sovereign's use all lands devolved to the crown by attainder or escheat; must levy all fines and forfeitures; and must seize and keep all waifs (q.v.), wrecks, estrays, and the like, unless they be granted to some subject.

BAILIFF, HIGH. See HIGH BAILIFF.

BAILIWICK legally means the co. or district within which the sheriff's bailiffs may execute their office. Blackstone says that this word was introduced by the princes of the Norman line in imitation of the French, whose territory was divided into bailiwicks, as that of England into counties.

BAILLET, ADRIEN, 1649–1706; a French writer and critic. His parents were poor, but he found a friend in the bishop of Beauvais, who educated and advanced him to the priesthood. In 1680, he was librarian to the advocate general of the parliament of Paris, of whose library he made a remarkable catalogue in 35 folio volumes, all written with his own hand. He was an incessant worker, scarcely sparing time for needful rest. He wrote a *History of Holland from* 1609 *to* 1690 (a continuation of Grotius), in 4 vols.; *Lives of the Saints, Life of Descartes*, etc.; but his most valuable production is *The Judgment of the Learned on the Principal Works of Authors*, in 9 vols.

BAILLEUL, a t. of France, department of the Nord, with manufactures of woolens, cottons, lace, hats, beet-root sugar, etc.—the cheese of its neighborhood being also celebrated. Pop. in 1876, 8180.

BAILLIE, JOANNA, a modern poetess of distinguished merit, was b. in 1762 at Bothwell, in Lanarkshire, Scotland. Her father was a Presbyterian clergyman. She received a superior education, and soon began to manifest those talents which subsequently excited the admiration of the public. Her career was a singularly happy one, but devoid of all striking incident. At an early period, she went to reside in London, where her brother, Matthew Baillie, had established himself as a physician. Here she remained till her death, which occurred on the 23d of Feb., 1851, when she had attained the venerable age of 89. No authoress ever enjoyed a larger share of the esteem and affection of her literary contemporaries. All vied in showing her a courteous respect, and even America sent its votaries to her little shrine at Hampstead. Her greatest achievement is undoubtedly the *Plays on the Passions*, which, though erroneous in conception, are full of noble and impressive poetry, and often characterized by intense dramatic power. The principle upon which Miss B. proceeded in the construction of these works, was to take a single passion as the subject of a play, and to exhibit its influence on an individual supposed to be actuated by nothing else. In point of fact, such persons do not exist in society; men are swayed by a variety of conflicting emotions; and even when any one of these becomes dominant, it does not wholly destroy the rest, otherwise the victim of a ruling passion would lapse into a monomaniac. The leading personages of Miss B.'s plays are, therefore, rather impersonations of certain elements of human nature, than genuine human beings. They are vivid poetical studies in psychology; not mirrors held up to nature, like the brilliant and variegated creations of Shakspeare. Still, there are scenes, in her tragedies especially, where the interest of the reader is intensely excited by the great art shown in the minute delineation of a particular passion, and where he is forced to forget the artificial theory of the authoress. The first volume of the *Plays of the Passions* appeared in 1798, and met with remarkable success. Four years afterwards, she published a second volume; in 1804, *Miscellaneous Plays;* in 1812, the third volume of her *Plays of the Passions;* and in 1836, three volumes of dramatic poetry. The most popular as well as the most powerful of her works is the tragedy of *De Montfort*. It was brought upon the stage in London, Kemble acting for eleven nights the character of the hero. Many of Miss B.'s minor pieces are very sweet, simple, and beautiful; and are marked by a sprightly grace of versification, and a playful serenity of spirit, which pleasantly remind one of the personal character of the authoress herself.

BAILLIE, MATTHEW, M.D., a distinguished physician and anatomist, was b. on the 27th Oct., 1761, in the Manse of Shotts, Lanarkshire, Scotland. His father was descended from the family of B. of Jerviswood, so noted in the history of Scotland during the reign of Charles II.; his mother was a sister of the two celebrated anatomists, William and John Hunter; and one of his sisters was Joanna B., the poetess. Talent seems to have been both hereditary and abundant in the family. On account of his abilities, his father was appointed professor of divinity in the university of Glasgow, where young B. went through the usual curriculum, and afterwards proceeded to Balliol college, Oxford, as an exhibitioner on the Snell foundation. In 1780 he commenced his anatomical studies in London under the care of his uncle, and was frequently employed as demonstrator to

the latter in his theater at Great Windmill street. His success in this capacity was so great, that on the death of Dr. Hunter, in 1783, he was found qualified to become his successor. In 1784, he began to lecture, and acquired a high reputation as a vigorous and lucid expositor of the science of anatomy. In 1795, he published a small work entitled *The Morbid Anatomy of Some of the Most Important Parts of the Human Body.* It made an era in medical science. In addition to the information formerly scattered through the writings of Bonnetus, Lieutaud, Montagni, and others, it contained a multitude of ingenious observations made by his uncle and himself, and greatly enhanced our knowledge of the changes produced on the human frame by disease. It had a remarkable influence on the study of medicine, and excited in a greater measure, perhaps than any other book, a spirit of careful induction among professional men. In 1799, Dr. B. relinquished his anatomical lectureship, and in 1800, his appointment as physician to St. George's hospital, which he had held for 13 years. He now devoted himself exclusively to his duties as a medical practitioner, and by his honorable assiduity succeeded in realizing a large fortune. In one of his busiest years, when he had scarcely time to take a single meal, his professional income is said to have reached £10,000. In 1810, he was appointed physician to the king, and offered a baronetcy, which, however, he declined. At last, worn out with incessant labor, he died on the 23d Sept. 1823.

BAILLIE, ROBERT, one of the most eminent, and perhaps the most moderate of all the Scotch Presbyterian clergy during the time of the civil war, was b. at Glasgow in 1599, and educated at the university of that city. In 1622, he received episcopal ordination—episcopacy being then nominally the established religion of the country—from archbishop Law, and was shortly after presented to the parish church of Kilwinning. At first a maintainer of the doctrine of passive obedience, he seems to have changed his opinions on this point some time during 1630–36. In 1638, he sat in that famous general assembly of the Kirk of Scotland which met in Glasgow to protest against episcopacy being thrust on an unwilling people, but conducted himself with greater prudence and temperance than was quite agreeable to his excited brethren. However, he soon threw himself eagerly into the national cause. In 1640, he was selected by the Scottish leaders, on account of his pamphlet against Laud's party, as a proper person to go to London, along with other commissioners, to prepare charges against archbishop Laud, whose rash and tyrannical measures were alleged to have been the origin of the recent hostilities against the sovereign. On his return to Scotland in 1642, he was appointed joint-professor of divinity at Glasgow, along with Mr. David Dickson, an equally distinguished, but less moderate divine. In 1643, he was again sent to London as a delegate to the Westminster assembly of divines, where he conducted himself in an unobtrusive manner, but cordially concurred in the doctrines which were drawn up. It is curious to notice, in connection with this incident of his career, that though Mr. B. had himself experienced the injustice of intolerance, like almost every other theologian of his age, he vehemently discarded the principle of toleration, and asserted the divine right of presbytery with as much emphasis as Laud did the divine right of episcopacy. After the execution of Charles I., in 1649, B. was chosen by the church to proceed to Holland, and to invite Charles II. to accept the covenant and crown of Scotland. Though it was not easy to deal with one of Charles' slippery character, B. is admitted to have borne himself in the matter with great prudence and dignity. After the restoration, he was made principal of Glasgow university. He died July, 1662. His *Letters* are a valuable contribution to our knowledge of the times.

BAILLIE, ROBERT, of Jerviswood, happily described as the Scottish Sydney, was a native of Lanarkshire and distinguished himself during the latter part of the reign of Charles II. by his bold opposition to the tyrannical misgovernment of the duke of Lauderdale. Having on a certain occasion (June, 1676) rescued a relative, the Rev. Mr. Kirkton, from the clutches of archbishop Sharpe's principal informer, a wretched profligate of the name of Carstairs, who pretended that he had a warrant for the apprehension of the clergyman, but refused to show it, B. was actually prosecuted for interfering to prevent the illegal capture of his friend. For this purpose an ante-dated warrant was furnished to Carstairs, signed by nine of the councilors. The marquis of Athole afterwards admitted to bishop Burnet that he was one of the nine who lent their names to this infamous document. The case was therefore made out to be a tumult against the government. B. was fined in 6000 merks (£318). He refused to pay, and was sent to prison; but so strong was the indignation of the Scottish gentry that he was released at the end of four months, in consideration of payment of one half of his fine to Carstairs. In 1683, B. took a prominent part in a scheme of emigration to South Carolina, as he saw no other refuge from the degrading tyranny of the government. About the same time, however, he entered into correspondence with the heads of the new puritan party in London, whose leaders were Russell, Sydney, and the duke of Monmouth, and subsequently repaired to that city to concert measures for a vigorous insurrection against the government, not, however, so far as he was concerned, with a view to revolution, but as the only means of securing adequate reforms. On the discovery of the Ryehouse plot, B. was arrested and sent down to Scotland. Accused of conspiring against the king's life, and of being hostile to monarchical government, B. was tried at Edinburgh, and condemned to death upon evidence at once insufficient and illegal. His bearing both on his trial and during

his imprisonment was such, that his cousin, bishop Burnet, declared "it looked like the reviving of the spirit of the noblest of the old Greeks or Romans, or rather of the primitive Christians and first martyrs;" and the celebrated Dr. Owen speaks of him as a "great spirit," "a person of the greatest abilities I almost ever met with." The sentence was carried into execution on the 24th Dec., 1684. It is to be regretted that so few opportunities were afforded B. of achieving anything really great, for he seems from all accounts to have possessed a remarkable strength of character and noble fearlessness of spirit.

BAILLY, JEAN SYLVAIN, a distinguished French savant, president of the national assembly of 1789, and mayor of Paris, was b. in that city Sept. 15, 1736. Originally intended by his father for an artist, he first turned aside into literature, until, becoming acquainted with Lacaille, he was fortunately induced to study astronomy, which proved to be the true sphere of his genius. In 1763, B. presented to the académie des sciences his *Lunar Observations;* in 1766 appeared his *Essay on the Satellites of Jupiter, with Tables of their Motions;* and in 1771, a treatise on the light of these satellites, remarkable for the profundity of its astronomical views, and which classed him at once among the greatest astronomers of his time. His historico-scientific works, especially his *History of Indian Astronomy*, are full of learning and ingenious disquisition, and written with great elegance. In 1777 he published his *Letters on the Origin of the Sciences;* and in 1799 his *Atlantis of Plato.* In 1784 he was elected a member of the académie française; and in the following year, of the académie des inscriptions. The *éloges* which he wrote about this period for the académie des sciences on Charles V., Molière, Corneile, Lacaille, Leibnitz, Cook, and Gresset, were very highly praised. Fontenelle was the only Frenchman before him who had enjoyed the honor of being a member of the three académies at once. The revolution interrupted his peaceful studies. During the earlier part of it he occupied a very prominent position. Elected president of the national assembly, June 17, 1789, and mayor of Paris on the 15th of July, he conducted himself in these capacities with great integrity and purity of purpose; but at last lost his popularity by allowing the national guard to fire on the masses who were assembled in the Champs de Mars, on the 17th of July, 1791, to demand the dethronement of the king. He now threw up his mayoralty, considering it impossible to satisfy either party, withdrew altogether from public affairs, and went to live first at Nantes, and afterwards with his friend Laplace at Melun. Here he was seized by the Jacobin soldiery and brought to Paris, where he was accused of being a royalist conspirator, condemned and executed with the usual Jacobin preliminary of savage insult, Nov. 11, 1793. Among his papers were found, and afterwards published, an *Essay on the Origin of Fables and Ancient Religions* (1799), and *Memoirs of the Revolution by an Eye-Witness* (1804). There cannot be two opinions regarding the merit of B.'s style, but his historico-astronomical speculations are now considered fantastic.

BAILMENT, an English law term, defined to be "a delivery of goods for a particular purpose, upon a contract, expressed or implied, that the purpose shall be carried into effect, and that, when that is done, the goods shall be restored by the bailee, or person to whom they are delivered, to the owner or bailor, or according to its directions."—*Tomlin's Dict*

BAILMENT (*ante*), the delivery of something of a personal nature by one party to another, to be held according to the purpose or object of the delivery, and to be returned, or delivered over, when that purpose is accomplished. B. may be divided into three kinds: 1. For the benefit of the bailor, or some person whom he represents. 2. For the benefit of the bailee, or some person represented by him. 3. For the benefit of both parties. In the first class, the bailee is required to exercise only slight care, and is responsible only for gross neglect. In the second he must exercise greater care, and is held for slight neglect. In the third he is to exercise ordinary care, and is responsible for a neglect not extraordinary. A person receiving the goods of another to keep without recompense, acting in good faith and keeping them as he would his own, is not answerable for their injury or loss; for, as he derives no benefit, he is responsible only for bad fault or gross neglect. This responsibility may be more or less by special acceptance, and a spontaneous offer on the part of the bailee may require him to be more careful. But the borrower who receives the entire benefit of the B. must use extraordinary diligence in the care of the property, and may be held for the slightest neglect. It must be used by him only for the purposes for which it was borrowed; he cannot keep it beyond the specified time, nor hold it as a pledge for demands otherwise made against the bailor. In the third class, the benefits are reciprocal, and advantage accrues to both parties; the parties stand upon equal footing, and neither can require more than ordinary care and prudence. In B. the depositary has the right of possession against any but the true owner. A borrower has no property in the thing borrowed, but may protect his possession by action against a wrong-doer. The hire of things for use transfers a special property in them for the use agreed upon; the price paid is the consideration for the use, and the hirer becomes for the time proprietor of the things bailed, having the right to keep them for the time agreed upon. In general, the hire of labor and services is the essence of every species of bailment in which compensation is to be given for care and attention bestowed upon the things bailed. The contracts of

warehousemen, carriers, forwarding and commission merchants, factors, and all who receive goods to deliver, carry, forward, sell, or keep, are of this nature, and involve the hiring of services. In a more limited sense, a B. for labor and services is a contract by which materials are delivered to a laborer or artisan to be wrought into some other form. The title remains with the party delivering the goods, and the workman acquires a lien upon them for his services. The owner may reclaim his property after the work is done, but the laborer can hold it until he is paid. Inn-keepers and common carriers are held responsible for goods intrusted to them except against inevitable accident, or against the public enemy. They are in effect insurers. The inn-keeper is responsible for the property of a guest, though it may be lost by theft. The common carrier is responsible in case of loss by fire, unless caused by lightning or tempest.

BAILY, EDWARD HODGES, R.A., an eminent sculptor, was b. at Bristol on the 10th Mar., 1788. In 1807 he went to London, saw Flaxman, and entered his studio. In 1809 he gained the silver medal at the society of arts and sciences, and the silver and gold medals at the royal academy. His works during this part of his career were chiefly, if not altogether, classical figures. They exhibit great care in execution, and are simple and pure in conception; but it was not till his twenty-sixth year that the full power and originality of his genius manifested itself in his celebrated "Eve at the Fountain," a figure of exquisite grace and loveliness. His next works were, "Hercules Casting Lycus into the Sea," "Apollo Discharging his Arrows," and "Maternal Love." George IV. also employed him, along with other artists, to execute the sculpture in front of Buckingham palace, the figures on the marble arch, and the "Triumph of Britannia," as also the *bassi-relievi* that surround the throne room. Besides these, B. executed a great number of busts and statues of distinguished contemporaries, such as Telford the engineer, earl Grey (14 ft. high), and Sir Astley Cooper. The statue of Nelson, in Trafalgar square, is likewise the work of his hands. His "Eve Listening to the Voice," the "Sleeping Nymph," "Girl Preparing for the Bath," and "The Graces Seated," are among the finest efforts of his genius. D. 22d May, 1867.

BAILY, FRANCIS, an eminent English astronomer, was b. at Newbury, Berks, in 1774, and d. in London, in 1844. In the midst of active business as a London stock-broker, he laid the foundation of his scientific fame, and during the years of life usually devoted to repose, underwent labors and rendered services to astronomy, which entitle him to be regarded as one of the most remarkable men of his time. Among the chief of these services were his share in the foundation of the astronomical society, and in the improvement of the *Nautical Almanac,* his laborious repetition of Cavendish's pendulum experiments, and the production of the astronomical society's star-catalogue. The latter, says his biographer, Sir J. Herschel, "put the astronomical world in possession of a power, which may be said, without exaggeration, to have changed the face of sidereal astronomy." In addition to several standard works on life-annuities, etc. (1808–13), and an immense mass of contributions to the *Memoirs of the Astronomical Society,* he wrote a valuable *Life of Flamsteed* (1835), which gave rise to much hot discussion on the subject of that eminent man's connection with Newton.

BAIN, ALEXANDER, writer on mental philosophy, was b. at Aberdeen in 1818. He entered Marischal college and university in 1836, and graduated in 1840. From 1841 to 1844, he assisted the professor of moral philosophy in Marischal college, and in 1844–45, taught the class of natural philosophy. In the winter of 1845–46, he lectured on natural philosophy in the Andersonian university, Glasgow. In 1847, he became assistant-secretary to the metropolitan sanitary committee, and was thence transferred to the same office in the general board of health, which office he resigned in 1850. From 1857 to 1862, and from 1864 to 1869, he was examiner in logic and moral philosophy in the university of London. For several years he acted as examiner in mental philosophy at the India civil service examinations. In 1860, he became professor of logic in the university of Aberdeen.

Mr. B. began as a writer in 1840, by contributing to the *Westminster Review.* He also contributed a considerable number of treatises to the publications of W. and R. Chambers, especially in the educational department; among them was an edition of the *Moral Philosophy of Paley, with Dissertations and Notes* (1852). In 1855, he brought out *The Senses and the Intellect,* and in 1859, *The Emotions and the Will,* completing a system of the human mind. In 1861, appeared *The Study of Character, including an Examination of Phrenology.* In 1863, he published an *English Grammar,* and in 1866, a *Manual of English Composition and Rhetoric.* In 1868 appeared his *Mental and Moral Science, a Compendium of Psychology and Ethics;* in 1870, *Logic, Deductive and Inductive;* in 1872, *A Higher English Grammar;* in 1874, *Companion to the Higher English Grammar.* In 1872, he acted with prof. Robertson in preparing for publication Mr. Grote's posthumous treatise on *Aristotle;* and, in 1873, edited, with a critical introduction, Grote's minor works. In 1873, he brought out a work on the *Relation of Mind and Body.*

As a thinker and writer, B. is remarkable for the subtlety and minuteness of his analysis, and the clearness of his exposition. He belongs decidedly to the empirical or experimental school of philosophy, in opposition to the *a priori,* or transcendental. His chief work, *The Senses and the Intellect,* together with *The Emotions and the Will,* is the most complete systematic exposition of the phenomena of the human mind in the

English or perhaps in any language. B.'s psychology is based on physiology, after the manner of Hartley's; but instead of considering the human organism as capable only of receiving impressions and of acting in response thereto, he finds in it a power of originating active impulses (see SPONTANEITY), and thus obviates many of the defects alleged by *a priori* philosophers to inhere in the system of sensationalism, as hitherto exhibited.

BAINBRIDGE, WILLIAM, 1774–1833; b. N. J.; a naval officer commissioned lieutenant in the reconstruction of the service in 1798. In that year his vessel was captured by the French, and he and his officers were kept prisoners for more than a year. In 1800, he transported a large sum of money to the dey of Algiers, who compelled him to convey an embassy to Constantinople. In the war against Tripoli he commanded the frigate *Philadelphia* and captured a frigate from the enemy; but his ship got aground, and he and over 300 men were kept prisoners until the close of the war. He was captain in 1806; and commodore in 1812, when he took command of the *Constitution* as his flag-ship, and went on a cruise with the *Essex* and *Hornet*. Off San Salvador, Dec. 26, he captured the British frigate *Java*. In 1815, he commanded a fleet of 20 ships intended to move against Algiers, but the impending war was avoided. During his career he was in command in the Mediterranean some half a dozen times, and settled several disputes with the Barbary rulers. For the capture of the *Java* congress gave him a gold medal, and distributed $50,000 to his men. In later life he was president of the board of naval commissioners.

BAINI, GIUSEPPE, one of the most distinguished scientific musicians of modern times, was b. in Rome on the 21st Oct., 1775. In 1795, when still only a pupil in the Seminario Romano, he was admitted among the singers in the Papal chapel, on account of his fine voice and his musical acquirements. Having been initiated by G. Zannaconi into the art of composition, he soon gained distinction by his compositions. The severe gravity and profound science of these contrasted strongly with the careless style and shallow dilettanteism of the modern Italian masters. B. has secured for himself a prominent place in musical literature, less, however, by his compositions than by his historical researches, which he found both encouragement and opportunity to make, when he was appointed director of the papal concerts in 1804, and general director of the choir in 1814. His principal work is his *Memorie Storico-critiche della Vita e delle Opere di Giov. Pierluigi da Palestrina*, etc. (2 vols. Rome, 1828). It is a valuable work, although disfigured by prejudices. The German edition of B.'s work, additions and explanations by Kandler, published by Kiesewetter (Leip. 1834), is especially deserving of notice, as very soon after its first publication it became a rare book on account of the small number originally published. Winterfeld published an edition with critical remarks (1832). B. died in 1844.

BAIRAKTAR', or, more correctly, Bairak-dar, signifying standard-bearer, is the title of the energetic grand vizier Mustapha. He was b. in 1755, and was the son of poor parents. He entered the military service at an early age, and soon distinguished himself by his valor. When he was pasha of Rustchuk in 1806, he fought not without success against the Russian army, which had advanced into Moldavia and Wallachia, and had taken Bucharest. After the revolt of the janizaries in 1807, by which Selim III. (q.v.) was deposed from the throne, in favor of Mustapha IV., B. at first concealed his attachment to the deposed monarch, and marched with his troops apparently against the revolted Servians; but as soon as he reached Adrianople, he compelled the grand vizier to return with him to Constantinople, in order to restore the throne to sultan Selim. On their return, they found this prince murdered, and his dead body lying in the first court of the seraglio. Filled with rage at this sight, B. caused all those to be executed who had had any share in the murder. He deposed Mustapha IV., and proclaimed the brother of this prince, Mahmoud II., sultan on the 28th July, 1808. B. was now appointed grand vizier. In the exercise of this office, he deposed the grand mufti, the leader of the janizaries, and all the ulemas who had taken any part in the last revolution; while at the same time he was careful to secure the tranquillity of the capital, and strengthened the regular army. His chief object was the annihilation of the janizaries; but, like the unfortunate Selim, he also fell a victim to these fierce bands of soldiery, who resisted everything like military discipline. Favored by the fanatical people, the janizaries rebelled, and, with the support of the fleet, attacked the seraglio on the 15th Nov., 1808, and demanded the restoration of Mustapha IV. B. defended himself bravely; but when he saw that the flames threatened to destroy the palace, and that he was in danger of falling alive into his enemies' hands, he strangled Mustapha, threw his head to the besiegers, and then blew himself up.

BAIRAM. See BEIRAM, *ante*.

BAIRD, ABSALOM, b. Penn., 1824; an officer in the union armies during the rebellion, a West Point graduate, captain in 1861, brig.gen. of volunteers in 1862. He was in constant service during the war, accompanied Sherman in the march through Georgia, and was at the surrender of Johnston's army at Durham station. He was brevetted maj.gen. of the regular army, and also of volunteers.

BAIRD, CHARLES WASHINGTON, D.D., b. N. J., 1828; son of Robert; graduated at the university of New York in 1848, and at Union theological seminary in 1851; Ameri-

can chaplain in Rome, 1851–53; pastor of a Reformed Dutch church in Brooklyn, 1859–61; since that time pastor of the Presbyterian church at Rye, N. Y. Dr. B. is the author of a work on Presbyterian liturgies, *A Book of Public Prayer*, a *History of Rye, N. Y.;* and has just completed an extensive and valuable history of the Huguenots, with especial reference to their migration to, and course in, the United States.

BAIRD, Sir DAVID, Bart., a general in the British army, was b. 6th Dec., 1757, at Newbyth, Scotland. He entered the service in 1772 as an ensign in the 2d foot, was promoted to a lieutenancy in 1778, and immediately after obtained a company in the 73d, a Highland regiment just raised by lord Macleod, with which he sailed to India. In the course of a few months, the young officer was plunged amid the perils of a sudden and sanguinary war. The English had excited the hostility of Hyder Ali by a gross breach of faith; and in the July of 1780, the latter burst into the Carnatic at the head of 100,000 men, disciplined and commanded by French officers. On the 10th of Sept., a portion of the English army fell into an ambuscade at Perambooum, and was cut to pieces. Among the few who remained alive to be taken prisoners was Baird, whose heroism had actually startled the French officers who were opposed to him. He was thrown into a dungeon at Seringapatam, where he endured a captivity of four years, that must have been peculiarly galling to a spirit so fierce, restless, and resolute as his. Released in July, 1784, he obtained the majority of the 71st in 1789, and in the Oct. of the same year visited England. In 1791, he returned, a lieutenant-colonel, and took part in several important sieges, attacks, and skirmishes; in 1795, he received a colonelcy; in 1798, he was raised to the rank of major-general; and in 1799 memorably signalized himself at the victorious assault of Seringapatam. He led the storming-party, having obtained that perilous honor at his own urgent request, col. Wellesley (afterwards duke of Wellington) commanding the reserve. In requital of his brilliant services, he was presented by the army, through the commander-in-chief, general Harris, with the state-sword of Tippoo Saib, and also with a dress-sword from the field-officers who served under him at the assault. His merit was likewise acknowledged by the home government. In the following year, he was appointed to the command of an expedition against Batavia, but which was afterwards sent to Egypt. On his return to India, he found that the star of Wellesley was in the ascendant; and B., who had already complained of the preference given to that officer, and who was, besides, of opinion that his own merits were constantly overlooked, applied for leave of absence, and sailed for Europe in 1803. He was received at court with great distinction, knighted in June, 1804, and made a K.C.B. in the following August. In 1805, he commanded an expedition against the Dutch settlements at the cape of Good Hope, which was successful; in 1807, he commanded a division at the siege of Copenhagen; and in 1808, was sent to Spain with an army of 10,000 men, to assist Sir John Moore. He distinguished himself in the battle of Corunna, Jan. 16, 1809. Moore having been killed in the action, Sir David succeeded to the chief command, and had the honor of communicating the intelligence of the victory to government. On this occasion he received, for the fourth time in his life, the thanks of parliament, and was created a baronet. After this period, he retired from active service. He d. Aug. 18, 1829.

BAIRD, ROBERT, D.D., 1798–1863; b. Penn.; a clergyman and author, graduate of Jefferson college in 1818. He passed several years in Europe, laboring especially for temperance and the revival and consolidation of evangelical Protestantism. He was agent and secretary of the American and foreign Christian union. Among his works are *Religion in America, A Visit to Northern Europe, Protestantism in Italy, History of the Albigenses, History of Temperance Societies in the United States,* etc.

BAIRD, SPENCER FULLERTON, LL.D., b. Penn., 1823; a naturalist, educated at Dickinson college, where he was professor of natural science. After being for a time assistant secretary of the Smithsonian institution, and became secretary in 1878, on the death of Joseph Henry. His works are a translation of the *Bilder Atlas* (in which he was assisted by others), published here as the *Iconographic Encyclopædia;* papers on natural history forming part of the *Reports of the Survey of Railroad Routes to the Pacific, The Birds of North America, The Mammals of North America,* and many papers in the scientific magazines.

BAIREUTH, a city, with a pop., in 1871, of 17,837, capital of the province of Upper Franconia, Bavaria, and formerly the capital of the principality of the same name. B. is beautifully situated on the Red Mayn, about 126 m. due n. from Munich. Its streets are broad and well paved, and are interspersed with groves, promenades, fine gardens, and public fountains. Its principal buildings are the old palace, the new palace, containing a gallery of paintings; the mint, opera-house, riding-school, infirmary, and town-hall. A magnificent new opera-house for the performance of Wagner's music, finished in 1875, was in the following year opened with a grand representation, lasting several days, of a new work by that composer. B.'s chief articles of industry are leather, cottons, woolens, linen, tobacco, parchment, and porcelain. Jean Paul Richter d. here in 1825, and a monument has been erected to his memory.

BAITOOL', or BETTOOL, a fortified t. of British India, in the presidency of Bengal, and territory of Saugor and Nerbudda, 50 m. n.e. from Ellichpoor.

BA'JA, a market t. of Hungary, in the circle of Bacs, on the Danube, celebrated for its annual swine-fair. Grain and wine, in large quantities, are produced in its neighborhood. Pop. '69, 18,110.

BA'JAN. See BEJAN.

BAJAZET', or BAJASID (pronounced Bayazet') I., Sultan of the Turks, was b. in 1347. In 1389, he succeeded his father, Murad I., who fell in battle near Kossova, fighting against the Servians. Immediately on ascending the throne, he inaugurated his rule, after the fashion of eastern kings, by strangling his younger brother Yacub, lest he should dispute the succession. In three years he conquered Bulgaria, a part of Servia, Macedonia, and Thessaly; he also subdued most of the states of Asia Minor. From the rapidity with which these extraordinary conquests were effected, he received the name of Ilderim—that is, Lightning. He even blockaded Constantinople itself for ten years, thinking to subdue it by famine. To rescue this city, king Sigismund of Hungary (afterwards emperor of Germany) assembled a large army, in which there were 2000 French nobles, under the command of the duke of Nivey. With this army, king Sigismund attacked the city of Nikopolis, in Bulgaria, situated on the Danube. B. hastened to meet him, and gained a decisive victory over the allied Hungarians, Poles, and French, on the 28th Sept., 1396. Sigismund escaped captivity only by a speedy flight in disguise; but the greater part of the French, through whose impetuosity the battle was lost, were taken prisoners, and were nearly all executed. B. would now have entirely destroyed the Greek empire, if he had not been prevented by Timur (q.v.), who attacked his possessions in Asia Minor, and completely defeated him on the 16th June, 1401, near Angora, the capital of what was anciently called Galatia, on the very spot where Pompey had formerly overthrown Mithridates. B. himself fell into the hands of the conqueror, who treated him with great generosity. The story that he was carried about imprisoned in a cage is without any historical foundation. B. died in 1403, in the camp of Timur. He was succeeded in the government by his son Soliman I. B. was honorably distinguished by his efforts to improve the administration of justice. During the 14 years of his reign, he built a large number of mosques, among others, one at Adrianople, and a second at Broussa, which two cities were then the ordinary residences of the Ottoman princes.

BAJAZET' II., son of the sultan Mohammed II., the conqueror of Constantinople, was b. in 1447, and ascended the Ottoman throne after his father's death in 1481. His reign, which lasted 32 years, was a succession of uninterrupted wars against Hungary, Poland, Venice, Egypt, and Persia, which were carried on with various success and without any events of striking importance, yet which served on the whole to establish the Ottoman power. The last years of his reign were much disturbed by disputes between his sons about the succession to the throne. Influenced by the preference shown by the janizaries for his younger son Selim, B. abdicated in his favor, but died before he could reach the place of his voluntary exile, in the neighborhood of Adrianople, in the year 1513. B. was a friend to the dervishes, at the same time liberal and fond of pomp and splendor. Many of the most beautiful mosques in Constantinople and Adrianople were built by him, and fitted up in a style of the greatest magnificence.

BA'JIMONT'S ROLL, the name given to a valuation, according to which the ecclesiastical benefices of Scotland were taxed, from the end of the 13th c. to the reformation. It took its name from an Italian churchman, Benemund or Baiamund de Vicci, who was sent from Rome by the pope about the year 1276, to collect the tithe, or tenth part of all the church livings in Scotland, for an expedition to the Holy Land. Hitherto, the Scotch clergy had been taxed according to a conventional valuation, called the *antiqua taxatio.* But Baiamund set this aside; and, in spite of their reclamations, assessed the benefices at their actual yearly worth, or *verus valor.* Although more than once referred to as an authoritative document in statutes of the 15th c., no complete copy of B. R., in its original shape, is now known to exist. A contemporary manuscript of so much of the roll as applies to the archdeaconry of Lothian, or that portion of the diocese of St. Andrews which lies to the s. of the Forth (comprehending the counties of Berwick, Haddington, Edinburgh, Linlithgow, and part of Stirlingshire), is preserved at Durham. The real value of the benefices in this district, as set down in B. R., exceeds the conventional value in the *antiqua taxatio* in the proportion of 420 to 286. A copy of B. R., as it appears to have existed in the reign of king James V. (1513–42), is preserved in the advocates' library at Edinburgh, in a hand of the beginning of the 17th century. It is full of inaccuracies; and it omits all livings of less than 40 marks a year. Of the *antiqua taxatio,* which was superseded by B. R., there are good copies in the handwriting of the 13th c., so far as concerns the benefices in the four dioceses of St. Andrews, Brechin, Aberdeen, and Moray.

BAJ'MAK, or BAJMOK, a large village of the Austrian empire, in Hungary, province of Bacs, 16 m. s.w. of Theresienstadt. Pop. '69, 6446.

BAJOC'CO, or BAIOCCO (pl. BAJOCCHI), was a copper coin in the Papal States, value nearly a half-penny. It was $\frac{1}{100}$th of the scudo, which was equal to 4*s.* 3½*d.* In the island of Sicily, the Neapolitan *grano,* the $\frac{1}{100}$th part of the ducato (= 3*s.* 4*d.*), was also called a bajocco.

BA'JUS, MICHAEL (properly, De Bay), one of the most distinguished theologians of the Catholic church in the 16th c., was b. in 1513 at Melun. He studied at Louvain, and became professor of theology there in 1550. He was present at the council of Trent in 1563, and also in 1564. He was the founder of a system of theology, based directly on the Bible and the writings of the Fathers, and setting aside the scholastic method. He had studied much the writings of St. Augustine, and therefore confined himself closely within the circle of ideas held by this father of the church, whose doctrines of the entire inability of the human will to do good, and the absence of merit in all good works, B. defended against the Jesuits. The assertions that the human will, so long as it is left to its own freedom, can do nothing but sin, and that even the mother of our Lord was not free from original and actual sin, together with other such doctrines, drew on him the accusation of heresy. Seventy-six of his propositions were condemned by a papal bull. B. submitted, but nevertheless did not give up his doctrines, and, in consequence, the persecutions to which he was subjected did not cease. He d. Dec. 16, 1589, having earned the reputation of great learning, pure manners, and singular modesty. He may be regarded as the predecessor of the Jansenists, who inherited his Augustinian views, which were at that time termed Bajanism. His writings, mostly of a polemical nature, were published by Gerberon (2 vols. Cologne, 1696).

BAJ'ZA, ANTON, a Hungarian poet and prose-writer, was b. Jan. 31, 1804, at Szücsi, in Hertes. His poems (2 vols. 1835), which were published in Pesth, earned for him a place among the best Hungarian lyric poets. In the *Kritischen Blättern*, to which he contributed from 1831 to 1836, the *Athenæum*, and the *Figyelmező* (Observer), to which he contributed from 1837 to 1843, in common with many of the best literary writers of the day, he exercised a beneficial influence on the rising literature of Hungary by his severe criticism, and his solid and theoretically correct essays. He likewise materially aided the Hungarian stage, then in its infancy, by the publication of the *Ausländischen Bühne* (Foreign Dramas, Pesth, 1830), and also by his exertions as director of the National Theatre, opened in Pesth on Aug. 22, 1837. At the same time, he had begun to occupy himself with historical studies, and enriched the literature of Hungary, very poor in this respect, with a *Történeti Könyetár* (Historical Library, 6 vols., Pesth, 1843–45), which contained translations from many excellent foreign historical works. He also published a compilation from the German, *Uj Plutarch* (The Modern Plutarch, Pesth, 1845–47). His *Vilagtörténet* (Universal History, Pesth, 1847) is a rather unskillful compilation from Schlosser, Heeren, Rotteck, and other German historians. After Mar., 1848, Kossuth appointed him editor of his half-official organ, the *Kossuth Hirlapja* (July till Dec., 1848), in conducting which, however, he displayed no great editorial talent. B. was made a member of the Hungarian academy in 1832. He d. Mar., 1858.

BAKALAHARI, one of the Bechuana tribes of Africa, in the Kalahari desert, s. of lake Ngami toward Orange river. They mingle with the Bushmen, and make some attempts at agriculture and traffic.

BÁKARGANJ, a district in India between 23° 14′ to 21° 48′ n., and 89° 55′ to 91° 5′ e., on the bay of Bengal; 4935 sq.m.; pop. 2,377,423. It is level, with not a single hillock, and full of tidal streams and marshes, but well cultivated. In the s. part are tigers, leopards, and other wild beasts. Of its population, 1,540,965 were Moslems, 827,393 Hindoos, 4049 Buddhists, and 4853 Christians.

BAKER, a co. in central Alabama, on the Coosa; 665 sq.m.; pop. '70, 6194—137 colored. Productions, corn, wheat, oats, cotton, and sweet potatoes. Intersected by two railroads. Co. seat, Grantville.

BAKER, a co. in n.e. Florida, on St. Mary's river; 570 sq.m.; pop. '80, 2,303—643 colored. Products, corn, sweet potatoes, sugar, and molasses. In the n. part is a portion of the Okefenoke swamp. Co. seat, Sanderson.

BAKER, a co. in s.w. Georgia, on Flint river, 1400 sq.m.; pop. '80, 7,305—5,565 colored. It has fertile soil, producing chiefly corn and cotton. Co. seat, Newton.

BAKER, a co. in s.e. Oregon, bordering on Nevada and Idaho; about 6000 sq.m.; pop. '80, 4,615—1,304 Chinese. It has gold and silver mines, and produces wheat, barley, etc. Co. seat, Auburn.

BAKER, EDWARD DICKINSON, b. England, 1811; killed in the battle of Ball's Bluff, Va., 1861. He came to this country when a child; studied and practiced law; was a member of the Illinois legislature, and in 1844 member of congress from that state; resigned, and volunteered in the Mexican war; commanded a brigade at the battle of Cerro Gordo; after the war, was again chosen congressman, but resigned, and in 1852 settled in California. Thence he went to Oregon, and was United States senator from that state. When the rebellion began, he raised a regiment in New York and neighborhood, was offered a commission as brig.gen. but declined it, and fell at the head of his favorite troops.

BAKER, OSMON CLEANDER, D.D., 1812–71; b. N. H.; a clergyman; educated at Wesleyan university; began his pastorate in 1844; in 1847 occupied the chair of theology in the Methodist Biblical institute at Concord, N. H.; was afterwards president of the

institution until 1852, when he was chosen bishop of the Methodist Episcopal church. He is author of a work on ecclesiastical law and polity of the church.

BAKER, Sir RICHARD, author of the *Chronicle of the Kings of England,* a book long esteemed and quoted on all matters of English history by the country gentry. Addison makes his model squire, Sir Roger de Coverley, refer to it frequently. Notwithstanding its reputation, however, among that class, the book had no lack of errors, and is now all but forgotten. Its author was born in Kent, or, according to other accounts, in Oxfordshire, about the year 1568. He was educated at Oxford university, and in 1603 was made a knight. About 1620 he married and settled in Oxfordshire, of which county he was made high sheriff; but he was soon after thrown into the Fleet prison for debt which his wife's family had contracted, but for which he had become responsible. Here he wrote his *Chronicle,* first published in 1641, besides several pious works of less note. He died in prison, in great poverty, in 1645.

BAKER, Sir SAMUEL WHITE, K.C.B., an African traveler, was b. in 1821. He is the son of Mr. Samuel Baker, of Thorngrove, in Worcestershire. B. was educated as an engineer, and at an early age went to Ceylon. There, led by the love of field-sports into the recesses of the island, he gave evidence of that love of adventure which was to make him famous as an explorer. In 1854, he published a work entitled *The Rifle and the Hound in Ceylon;* and in 1855, *Eight Years' Wandering in Ceylon.* B. afterwards superintended the construction of the railway which connects the Danube across the Dobrudscha with the Black sea. In 1860, B. married Florence, the daughter of F. von Sass, a young Hungarian lady of great talent and enterprise; and in company with her, he undertook a journey of exploration on the upper Nile. They set out from Cairo in April, 1861; and B. devoted his attention first to the Atbara and Blue Nile, the chief affluents of the Nile, which descend from the highlands of Abyssinia. In June, he arrived at the course of the Atbara, which was at that season dry, or marked only by a few stagnant pools. On the 23d, when the Abyssinian rainy season had set in, a noise like distant thunder was heard, and in a few seconds the river-bed had been converted into a torrent 20 ft. deep. Eight days later, it had become a great river, charged with mud, washed from the hills, which it carried down to the Nile, to cause the inundations and mud deposits of Egypt. B. reached Khartoum in June, 1862, and there he had an opportunity of contrasting the Blue and White Nile. He found the former, like the Atbara, to be a mountain torrent, rising and falling with the Abyssinian rains, but always free from deposits of mud. The White Nile did not thus rise and fall, and its water, never pure, had a disagreeable taste of vegetation, showing that it proceeded from lakes and marshes. When B., with his wife, quitted Khartoum to ascend the White Nile, he had in his pay an escort of 90 persons, 29 camels and asses, and three large boats. After passing through a wonderful region of forests and marshes, the travelers reached Gondokoro, a rendezvous of the traders of the interior. They had only been there a fortnight, when they were joined by Speke and Grant, who had penetrated into those regions from the south. Speke and Grant told B. of the Victoria N'yanza, which they had just discovered and explored, and that the natives had described to them another great lake, named Luta Nzige, which they had been unable to visit. B. resolved to reach this lake; and after a series of adventures, he and his wife arrived, on the 14th Mar., 1864, on the top of lofty cliffs, from which they beheld the vast inland sea, to which B. gave the name of the Albert N'yanza. In 1869, an expedition for the suppression of slavery in the interior of Africa was organized by the pasha of Egypt, under B.'s command. B. returned in 1873, and reported the success of the expedition. The resignation of his successor, col. Gordon, however, and the deposition of the Khedive in 1879, again led to a suspension of government control in the valley of the Nile. B. was knighted in 1866. In 1866, he published *The Albert N'yanza;* in 1871, *The Nile Tributaries of Abyssinia;* in 1874, *Ismailia,* an account of his expedition of 1869–73; and in 1879, *Cyprus as I saw it in* 1879.

BAKER, WILLIAM MUMFORD, b. 1825; a graduate of Princeton. He has written the life of his father, Daniel B.; *Inside, a Chronicle of Secession; The New Timothy; The Virginians in Texas,* etc. He has been a Presbyterian pastor in Texas and Ohio, and is now a pastor in Boston, Mass.

BAKERIES, ARMY. Armies have generally the means of obtaining soft or loaf bread, though not till recently could this be said of the British army. The French, ever since the time of Louis XIV., have been accustomed to take portable ovens with their armies; those now used will each bake 450 rations at once. Outside Sebastopol, in the winter of 1854, the British soldiers sometimes willingly exchanged with the French 3 or 4 lbs. of biscuit for 1 lb. of soft bread. The efforts since made to improve the sanitary condition of the army have included the establishment of traveling bakeries for field-service. Under the commissaries, the troops now rarely fail to obtain their daily rations of fresh-baked bread. We were last among the greater nations to make this obvious improvement; but the French depend more on bread and less on meat than the English; and this may partly account for the difference. The French soldiers are taught to construct field-ovens, and to bake their bread in camp, while government B. are established all over France, entirely conducted by soldiers. Among other lessons afforded by the siege of Sebastopol, was one relating to an improved supply of army-bread. Two screw-

steamers, the *Bruiser* and the *Abundance*, were sent out to Balaklava, one provided with machinery for grinding corn, and the other with machinery and ovens for making and baking bread. In each case the ship and the machinery were propelled by the same steam-engine. When quietly anchored in the harbor, the mill ground 24,000 lbs. of flour per day—better in quality, and cheaper than could have been obtained by contract. The bakery ship *Abundance* had four ovens of 14 bushels' capacity each; it baked in an excellent manner 6000 loaves of 3 lbs. each per day, which loaves were sent up to the siege-army as soon as cooled. The ships and machinery were sold when the war was over—a proceeding which the commissariat officers much regretted; but the experience thence obtained will not be lost. The improved arrangements suggested for meat-rations are noticed under COOKERY, ARMY.

BAKEWELL, a small but very ancient t. in Derbyshire, on the left bank of the Wye, near its confluence with the Derwent, and 24 m. n.n.w. of Derby. It lies on the slope of a hill, in the midst of very beautiful scenery, in a carboniferous limestone tract, and in the vicinity of black marble quarries, and of coal and lead mines. Its chalybeate springs and warm baths are much resorted to. The celebrated Arkwright first established cotton-mills here. On the opposite bank of the Wye are the traces of a castle built by Edward the Elder in 924. B. is now the property of the duke of Rutland, whose seat is Haddon hall, two m. from the town. B. is a center for visiting the fine scenery of North Derbyshire and the Peak; and the streams in the vicinity are much resorted to by anglers. It contains a spacious cruciform church, founded in Saxon times, and showing specimens of ecclesiastical Gothic architecture of three different periods. The special industry of B. is the turning, polishing, and inlaying of the local marble. Pop. '71, 2283.

BAKEWELL, ROBERT, a celebrated agriculturist, was b. in 1726 at Dishley, in the co. of Leicester, and d. in 1795. He does not appear to have written anything, even upon the subjects with which he was so well acquainted, so that his fame rests entirely upon his successful efforts to improve the breed of domestic animals. His reputation was so great as a breeder of sheep, that he is said to have received the fabulous sum of 400 guineas for one season of a ram. The long-horned breed of cattle which he introduced is still known as the Dishley or New Leicestershire breed. His horses were also famous, and almost as profitable to him as his sheep. One of his objects was to produce a breed of animals that would fatten on the smallest quantity of food.

BAKHTEGAN', a salt-lake of Persia, province of Farsistan, from which remarkably fine salt is obtained. Its size is variously stated—some writers making it 60 m. in length, with an average breadth of 8 m.; others, only 70 m. in circumference.

BAKING is the mode of cooking food in an air-tight chamber or oven. The term is also applied in the manufacture of bricks (q.v.), porcelain (q.v.), etc. The B. of bread will be treated under BREAD. The oven attached to kitchen-grates for cooking is simply an iron chamber, with flues for conveying the heated gases of the fire round it. In B., strictly so called, the oven is kept close, so that the steam and aroma arising from the inclosed substances are confined; but by opening ventilators a current of air is produced, and then these ovens may be used for what is called *oven-roasting*. The rank taste that often characterizes baked dishes is thus avoided. Ovens are now often heated by water, or by steam, and also by gas. Meat for B. is placed in a dish, from the bottom of which it is raised on a wire frame or trivet. In M. Soyer's B.-dish, a wire frame rests on the edge of the dish, and on this potatoes are laid; a trivet, rising above the frame, supports the meat; while the bottom of the dish contains a Yorkshire pudding; the dripping thus falls upon the potatoes and pudding below.

B., although a convenient mode of cooking, is not considered quite so good as roasting (q.v.). The practice of having recourse to the baker's oven, saves both trouble and expense in heating, and is a matter of necessity with those who have not means of cooking at home; but it has this chief objection, that every dish becomes impregnated with the steam and odors of all the rest. Soyer pronounces it to be semi-barbarous.

BAKO'NY WALD (forest of Bakony), a densely wooded mountain-range of Hungary, s. of the Danube, dividing the great and little Hungarian plains. Immense herds of swine are annually driven hither to feed upon the mast of the forest. The keepers of these swine furnished those notorious robbers who play so important a part in the ballads of the Hungarian people, and in the imagination of travelers. The saintly king Stephen founded a cloister in the forest 1030 A.D. Only in recent times has this dangerous territory been thoroughly explored. The hills have an average height of 2000 ft., with quarries of valuable marble, in which a considerable export trade is done.

BAK'SHISH. The ordinary meaning of this word in Persian is a present; but in the east, in modern times, it has acquired the special signification of gratuity (Ger. *Trinkgeld*), which, however, the orientals do not quietly wait to receive, but demand loudly, and even insolently. Every traveler, whether in Turkey or in Egypt, in Asia Minor or in Syria, if he receives the smallest service from any one, is immediately reminded by the cry of "Bakshish, Bakshish," to pay for the courtesy by a gift of money. Even when the ambassadors to the supreme porte obtain an audience from the sultan, or from any of the high dignitaries, they are obliged, by the prompt gift of a B., to avoid a peremp-

tory demand for it on the part of the door-keepers and other servants. By degrees, the B. has been fixed by custom at certain sums.

BAKTSHI-SERAI' (the "City of the Gardens"), the residence of the ancient princes or khans of the Crimea, stands in a deep limestone valley, not far from the present capital, Simferopol. The city is kept in excellent repair, and had a pop. in 1867 of 11,448, consisting almost exclusively of remnants of the old Tartar inhabitants. It thus presents a striking contrast to the modern towns of the Crimea, and is one of the most singular in Europe. The palace of the ancient khans has been completely restored by the Russian government in the oriental style. It consists of a great labyrinth of buildings, courts, and gardens, and is situated about the middle of the town, dividing it into two parts. The chief manufactures of the place consist of articles of copper, Turkish saddles, and silk.

BAKU', a seaport t. of the Apsheron peninsula, in the Caspian sea. It is under the dominion of Russia, and contains (1867) 12,383 inhabitants, chiefly Persians and Armenians. The whole soil around B. is impregnated with naphtha, which forms an important branch of its industry. Some of the fountains ignite spontaneously, and this natural phenomenon has caused B. to be esteemed as a holy city by the Parsees or fire-worshipers, many of whom resort to it from very long distances. B., besides its trade in naphtha, exports cotton, silk, opium, saffron, and salt. The Arabian, Masudi, is the first who mentions B., about 943, and he gives an account of a great volcanic mountain in its vicinity, which is now extinct. B. was ceded by the Persians to the Russians in 1813. Capt. Baker states that the refuse of the oil drawn from the wells is, after the naphtha has been distilled from it, used now with great success as a substitute for coal in the steamers on the Caspian sea. The harbor, which is strongly fortified, is one of the chief stations of the Russian navy in the Caspian, and is also of great importance as a center of trade. A good deal of ship-building is carried on. B. is capital of a government of Russian Transcaucasia, with a pop. (1871) of 513,560.

BA'LA BEDS, a local deposit, occurring in the neighborhood of Bala, in North Wales, and forming a group in the lower silurian of Murchison. They consist of a few beds, rarely more than 20 ft. in thickness. The beds are chiefly composed of hard crystalline limestone, alternating with softer argillaceous bands, which decompose more freely, and leave the limestone like a cornice molding, affording a characteristic by which, at a considerable distance, the B. B. can be distinguished from the rocks of hard gritty slate above and below. Trilobites and cystideæ are the predominant fossils of the group. Calcareous beds, containing similar fossils, have been noticed in the silurian district of the s.e. of Ireland, and referred to this group.

BA'LAAM, the name of a prophet who figures prominently in the early history of the Israelites. He is first mentioned in Numbers xxii. 5, where Balak, king of the Moabites, alarmed at the irruption of the chosen people into his territories, is represented as sending messengers to Pethor, in Mesopotamia, the dwelling-place of the seer, to beseech him to come and curse the invaders. The narrative is, of course, familiar to every one, and it is therefore unnecessary to recount it; but it is marked by two peculiarities, which have excited much speculation and controversy. The first is the admittedly prophetical character of B., who was a *Gentile;* the second is the curious miracle in the case of his ass. With regard to the supernatural powers attributed to B., the most prevalent hypothesis is, that he was the last relic of the patriarchal age, during which communion with God was not formally restricted to one race, but diffused more or less among all the Semitic peoples. Some, again, suppose that his knowledge of God, from whom he apparently received miraculous communications, was derived from traditions of the primitive faith, scattered over Mesopotamia by Abraham, Jacob, Laban, etc.; though Hengstenberg conceives that he had been led to renounce idolatry by hearing of the miracles which attended the exodus of the Israelites, anticipating, as a reward for his change of worship, a further insight into futurity, and a greater power over nature. B. has ever been considered a type of those men who prostitute their powers and hold the truth in unrighteousness, receiving the wages thereof.

BALÆ'NA. See WHALE.

BALÆNOP'TERA. See RORQUAL.

BALAGHAT' DISTRICTS, the name given to a large tract of elevated country in the s. of India, 28,669 sq.m. in area, and extending from the rivers Tumbuddra and Krishna in the n. to the furthest extremity of Mysore in the south. Part of the ancient Hindu kingdom of Carnata, it was conquered by the Mohammedans, and fell into the hands of the British on the final overthrow of Tippoo (q.v.). The name Balaghat signifies *above the ghauts.*

BALAKLA'VA, a small port in the s.w. of the Crimea, separated by a rocky peninsula from the harbor of Sebastopol, from which the direct distance is about 6 miles. Pop. in '67, 742. The harbor, which affords secure anchorage for the largest ships, is perfectly landlocked, the entrance being so narrow as scarcely to admit more than one vessel at a time. To the e., overlooking the bay from a rocky eminence, are the ruins of a Genoese fortress. The foundation of the work is excavated into numerous chambers and galleries. It is the *Symbolon Limen* of Strabo; and the present name is supposed by

Dr. Clarke to be a corruption of the Genoese *Bella-chiava*, or Fair Haven. This was long the seat of a Greek colony; in the 14th c., it fell into the hands of the Genoese; about the end of the 15th, they were expelled by the Turks; and on the conquest of the Crimea by Catherine II. of Russia, it was made a military station for a regiment of Greeks and Albanians. In 1854, a few days after the battle of Alma, the town was occupied by the British army under lord Raglan, and the harbor formed, during the ensuing campaign, the head-quarters of the fleet, and the basis of operation of the army. Here ensued those scenes of mismanagement and confusion that have rendered B. a synonym for chaos, and the recital of which, with the resulting privations and misery to the soldiers, stirred so terribly the heart of England in the winter of 1854–55. A terrible hurricane on Nov. 14, 1854, in which 9 vessels were totally destroyed, and several others seriously injured, tended greatly to increase the confusion which incapacity and divided responsibility first occasioned at Balaklava. Soldiers, 6 m. distant, were dying for want of food, clothing, and medicine, which were hidden hopelessly beyond reach in store-rooms at B., or stowed away in the holds of ships that were not permitted to enter the harbor. Transport vessels, for which the country was paying enormous sums of money daily, were kept lying idle in port with their most anxiously awaited cargoes (for lack of which the troops were perishing by hundreds) unladen, while poor mutilated and dying soldiers lay miserably exposed on the heights for want of ships to convey them to the hospitals at Scutari. The rebuilding of the greater part of the town, the formation of a line of railway between B. and the camp, and certain official investigations in 1855, completely remedied this disgraceful state of things. The 25th of Oct., 1854, was signalized, on the height between the town and the Tchernaya, by those unparalleled cavalry charges, the record of which is among the saddest but proudest memories of the British army. See Kinglake's *Invasion of the Crimea* (5 vols., 1863–75), of which nearly the whole of the fourth volume is devoted to a minute account of the events connected with Balaklava.

BALANCE (of doubtful derivation), an instrument for ascertaining the weight of bodies in grains, ounces, pounds, or any other units of weight. The ordinary B. consists of a lever called a beam, whose point of support is in the middle of its length, and having dishes or scales suspended from either extremity. As it is of importance that the beam should move easily round its point of support, it rests on polished agate or steel planes, by means of knife-edges of tempered steel, which project transversely from its sides, and serve as the axis of rotation. By this arrangement, the surface of contact is reduced to a mere line, and the friction of the axis of the beam on its support almost entirely obviated. The scales are hung by means of chains attached to steel hooks, which rest also on knife-edges, but turned upwards instead of downwards, as in the first case. The essential requirements of a B. of this description are: 1st, That the beam shall remain in a horizontal position when no weights are in either scale; and 2d, That the beam shall be a lever of equal arms, or have the distances between the central knife-edge and those at either end exactly the same. To insure the first of these conditions, it is necessary that the center of gravity of the beam lie vertically below the point of support, when the beam is horizontal. When such is the case, the center of gravity at which the weight of the beam may be considered to act, oscillates as in a pendulum round the point of support, and always comes to rest right under that point, thus restoring to the beam its horizontal position when it has been tilted out of it. If the center of gravity were above the point of support, the beam would topple over; and if it coincided with that point, there being no restoring force, the beam would occupy indifferently any position into which it was thrown, the B. in both cases being useless. That a B. possesses the second of the above conditions, is ascertained by putting weights into the scales which keep the beam horizontal, and then transposing them, when, if it still remain so, the lengths of the arms are equal. Should the arms be of different lengths, a less weight at the end of the longer arm will balance a larger weight at the end of the shorter arm (see LEVER); but when transposed, the larger weight having the longer arm, and the smaller weight the shorter, the beam can no longer remain horizontal, but will incline towards the larger weight. A balance with unequal arms is called a false B., as distinguished from an equal-armed or just balance. When weighing with a false B., it is usual to weigh a body in both scales, and take the arithmetical mean—that is, half the sum of the apparent weights for the true weight. This is near enough to the truth when the apparent weights differ little from each other; but when it is otherwise, the geometrical mean (q.v.) must be taken, which gives the exact weight in all cases.

Although the preceding conditions are of essential importance, they do not supply all that we look for in a good balance. It is necessary, in addition, that the beam should turn visibly from its horizontal position when there is a slight excess of weight in the one scale as compared with the other. This tendency is termed *sensibility*, and depends upon the weight of the beam, the position of its center of gravity, and the length of its arms. Let ABD (fig. 1) represent the beam of a balance, C the point of suspension, G the center of gravity, and ACB the straight line joining the knife-edges, which may be taken as the skeleton lever of the balance. We shall here confine our attention to that construction where the three knife-edges are in a line, because it is the most simple and

at the same time the most desirable. We may, without altering the principles of equilibrium, consider the beam reduced to the lever AB, and embody its weight in a heavy point or small ball at the center of gravity, G, connected with C by the rigid arm CG. The scales (represented small in the fig. for the sake of space), with the equal weights in them being at an equal distance from C, have their center of gravity in that point; and their combined pressure acting there, is not directly by the supporting plane, so that they have no influence in determining any particular position of the beam. If a small weight, p, therefore, be put into the scale at B, the position of the beam is determined by its rotating tendency (moment) round C, and the counter-rotating tendency of the weight of the beam, W, acting at G. The question of sensibility is thus reduced to the action of the crooked lever GCB, with p acting at one end, and W at the other. The relations of the arms and forces of a crooked lever will be found under LEVER. It is only necessary here to state that the moment of the weight acting at the end of a crooked lever increases with its size, the length of its arm, and the smallness of the angle which that arm makes with the horizontal line passing through the fulcrum. Let us suppose that, under the effect of the opposing moments, the beam, as represented by the line AB, takes up the position marked by the dotted lines. If, now, we were to lengthen CB′, and keep CG′ as it is, CG′ would rise nearer to the horizontal line, and CB′ fall further from it, before equilibrium would be restored; and the inclination of CB′, or the beam to the horizontal line, thus being greater, the sensibility of the balance would be increased. Consequently, *the longer the arms of a B. are, all other things being the same, the greater will be its sensibility.* But the same object would be reached by keeping CB′ its original length, and shortening CG′, or bringing the center of gravity of the beam nearer to the point of support. The weight of the balance then having a shorter arm, the point G′, for the same reason as before, would need to rise higher, and B′ sink lower, before A′B′ would find its position of rest. Here, also, *the nearer the center of gravity of the beam is to the point of support, the greater will be the sensibility of the balance.* If now, however, we keep the length of the arms CG′, CB′ constant, but diminish the weight acting at G′, while p acting at B′ remains the same, it is manifest that to make up the deficiency in the weight W, the two arms will turn to the left, as in the preceding cases, so as to give W a longer and p a shorter *effective* arm. The smaller, therefore, the weight acting at G, or *the smaller the weight of the beam, the greater will be the sensibility of the balance.*

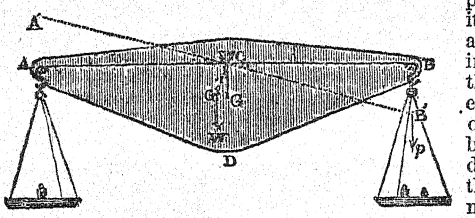

Fig. 1.

In the construction of the B., it is a matter of importance to have the sensibility independent of the amount of weight in the scales, so that, when heavily loaded, a small weight will produce the same inclination as when not loaded at all. This condition is implemented, as we have already shown, when the three knife-edges are kept in the same straight line. If the line joining the two terminal knife-edges lie below the point of suspension, then the center of gravity of the equal weights corresponding with the middle of that line, will, upon the turning of the beam, be forced from below that point, and will accordingly have a tendency to resume its former position. The equal weights thus counteract to some extent the effect of the additional weight, in causing the beam to incline, and their influence in this way will be all the greater as they themselves increase. When a B. is too heavily loaded for its strength, the three knife-edges, although previously in a line, do not retain that position, for the arms of the beam yielding to the pressure, cause the terminal knife-edges to sink below the one in the middle, and the knife-edges themselves losing their shape under the pressure, the sensibility is considerably diminished.

When a B. is very sensible, the beam keeps oscillating for a considerable time from one side to the other of the position in which it finally settles. Although such an instrument may be useful for physical and chemical experiments, it is not serviceable for the purposes of ordinary life, where minute quantities of the substance to be weighed are of little value, and where time, and consequently rapidity of indication, are matters of importance. The sensibility of a B. must, therefore, be adjusted to the purpose for which it is designed; sensible balances being employed for weighing finer, and less sensible, or *stable* balances, for weighing coarser materials. The stability, or the tendency of the beam to come quickly to rest, depends on requirements nearly the opposite of those which conduce to sensibility. In the construction treated of above, the stability increases with the moment of the weight of the beam acting at G round C, so that it thus increases with the weight of the beam, and the distance of the center of gravity from the point of suspension. The stability is also increased, as already shown, by having the line joining the scale knife-edges below the point of support.

There is another form of delicate balance employed in physical and chemical researches. The beam is constructed so as to combine lightness with strength, and rests by a fine knife-edge on an agate plane. It is surmounted by a weight moving on a screw, so that the sensibility may be increased or diminished, according as the weight is raised or

depressed. In order that the knife-edge may not become blunted by constant contact with the supporting plane, a cross-bar, with two projecting pins, is made to lift the beam from the plane, and sustain its weight when the balance is not in play. The beam is divided by lines marked upon it into 10 equal parts, and a small weight made of fine wire bent into the form of a fork, called a rider, is made to slide along to any of the divisions. If the rider be, for instance, $\frac{1}{10}$ of a grain, and if, after the weight of a body is very nearly ascertained, it brings the beam, when placed at the first division next the center, exactly to its horizontal position, an additional weight of $\frac{1}{100}$ of a grain will be indicated. The use of inconveniently small weights is, by this arrangement, to a large extent obviated. As the beam takes some time before it comes to rest, it would be tedious to wait in each case till it did so, and for this reason a long pointed index is fixed to the beam below the point of suspension, the lower extremity of which moves backward and forward on a graduated ivory scale, so that when the index moves to equal distances on either side of the zero point, we are quite certain, without waiting till it finally settles, that the beam will be horizontal. The same is seen in ordinary balances, only the tongue or index is above the beam; and according to its deviation on each side of the fork or cheeks by which the whole is suspended, is the future position of the beam ascertained. The finer balances are never loaded to more than a pound in each scale, and when so charged, will deflect with $\frac{1}{100}$ of a grain of additional weight in one of the scales, or will turn, as it is technically called, with $\frac{1}{1120}$ of the load. The finest balances turn with $\frac{1}{1000000}$ of the load, and some have been constructed which turn with much less. Even with the best achievements of mechanical skill, no B. can be made whose arms are absolutely equal; and to remedy this defect, the method of double-weighing is resorted to, when the utmost accuracy is demanded. This consists in placing the body to be weighed into one scale, and sand, or the like, into the other, until exact equilibrium is obtained, then removing the body, and putting weights or another body in its place which exactly counterbalance the sand. Both being thus weighed in precisely similar circumstances, must weigh precisely the same.

The Roman B., or *steelyard* (Ger. *schnellwage*), is more portable than the ordinary balance. It consists of a lever AB, moving round a knife-edge or point at C. The body to be weighed, W, is put into the scale which hangs from A; and a movable weight, P, is made to slide along the longer arm, until the lever AB remains horizontal. The weight of W is then read off from the division at which P rests. If the lever lie horizontal when unloaded, then equal weights at equal distances from C will balance each other, so that when W is balanced by P at a distance from C equal to AC, the two are of equal weight; but if equilibrium take place when P, say, is ten times as far from C as A is, then W will be ten dimes the weight of P; and the same holds for any intermediate point at which P may stand, W weighing as many times P as P's arm is a multiple of W's arm. To weigh a body of 10 lbs. by the ordinary B., a counterweight of 10 lbs. is necessary, making a total load of 20 lbs.; but in the case just supposed, 1 lb. balances 10, making a total load of only 11 lbs. The steelyard has, therefore, this advantage over the common B., that the load on the fulcrum, and consequently the friction, is less. On the other hand, however, there is this disadvantage, that the arms of the steelyard bend unequally under the strain of great weights, which in a B. with equal arms cannot, to the same extent, take place. As the steelyard is ordinarily made, the longer arm preponderates when the lever is unloaded, so that the graduation of the longer arm begins at a point between A and C, and not at C. The *Danish B.* differs from the ordinary steelyard in having the weight fixed to the extremity of the lever, and the fulcrum movable.

The *bent lever B.* (Fr. *peson*, Ger. *Zeigerwage*), shown in fig. 2, is a lever of unequal arms, A, C, B, moving round the pivot C, having a scale, Q, attached to the shorter arm, AC, and a fixed weight, W, to the longer arm CB. The longer arm ends in a pointer moving in front of a fixed graduated arc. When a body is put into the scale, the pointer rises from the bottom or zero point of the arc, and rests opposite the mark corresponding to the weight of it. The higher the weight W rises, the longer becomes its *effective* arm, and the greater must be the weight it balances. The arc is generally graduated experimentally, the geometrical graduation being somewhat complicated.

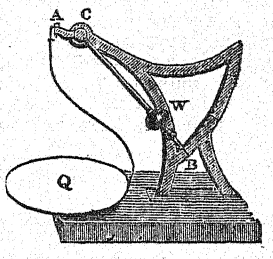

Fig. 2.

For other weighing apparatus, see SPRING-BALANCE; WEIGHING-MACHINES.

BALANCE AND BALANCE-SPRING. The balance of a watch is a wheel finely poised on its axis; the pivot-holes in which it turns being frequently—in chronometers and clocks, as well as in watches—jeweled, or made of small rubies, diamonds, etc., for the sake of durability. The natural effect of an impulse given to such a wheel would be a complete rotation on its axis. This, however, is convertible, by the escapement (q.v.), and by the balance-spring, into a vibratory motion. The balance-spring is held to be a crowning invention in the mechanism of the watch; and the honor of its first suggestion has been claimed for no less than three very eminent men—for Dr. Hooke, an Englishman; for Abbé Hautefeuille, a Frenchman; and for Hüyghens, the Dutch astronomer. The honor, however, undoubtedly belongs to Hooke.

The balance-spring consists of a coil of steel-wire, so delicately manufactured that 4000 of them scarcely weigh more than one ounce, though often costing more than £1000. In its application to the balance of a watch, one of the extremities of the spring is fastened to a point independent of the balance, while the other is attached near its axis. When the balance is at rest, the spring is inclined neither way, this position being called the point of rest; but when the impulse is given to the balance by the crown-wheel of the escapement, the balance moves round just so far as the impulse given is able to overcome the elastic resistance of the spring. When that resistance becomes equal to the impulse given, the balance stops for a moment, and then is driven back by the elastic recoil of the spring, and continues thus to vibrate so long as the impulse is repeated or the watch is in motion.

The recoil of the spring is sufficient to drive back the balance to a distance nearly double the length of its first motion; this is, therefore, called the long arc of vibration. But when the motion of the balance is free, with a certain length of spring, the *long* arc of vibration is made in less time than the short one, to which the impulse is given: with a spring of greater length this relation is reversed; whence it was concluded by Le Roy and Berthoud, that equality of time, or *isochronism*, in unequal vibrations, could be more easily obtained by lengthening the spring than by tapering it. In England, where time-keepers have been brought to their greatest perfection, it is considered that isochronism is most easily attainable by using the cylindrical helical spring, which is applied to all marine chronometers.

An improvement in watches, or rather in chronometers, invented by Mr. Dent of London, consists in coating the balance and balance-spring with gold by the electro-metallurgic process, by which means they are secured from rust.

BALANCE OF POWER, an expression used in diplomacy for that state of matters in which no one of the European states is permitted to have such a preponderance as to endanger the independence of the others. This idea is not, as some say, confined to modern times. The Greek states acted upon it by a kind of instinct of self-preservation, though it was not directly formulated. It has, however, become more distinctly avowed as a motive of political conduct, and more systematically acted upon since the time of Charles V., whose overgrown power and ambitious designs awakened the other European powers to the danger of such overwhelming preponderance in one state. The motive of preserving the B. of P. came first distinctly into the foreground in those unions which England, Holland, and Austria repeatedly formed against the menacing schemes of Louis XIV., for acquiring the dominion of all Europe. It was the same cause that broke up the most dangerous (for Louis) of these coalitions; for in the war of the Spanish succession, when the Hapsburg pretender to the Spanish throne became, by the death of Joseph I., sovereign of Austria and emperor of Germany, and the power which, in the hands of Charles V., had menaced the equilibrium of Europe, was thus likely to be again wielded by one man, England withdrew from the coalition, and thus saved Louis from a decided overthrow. The aggressions of Napoleon called all the powers of Europe to arms against him in the name of the B. of P.; and in readjusting the map of Europe, the B. of P. was often invoked to cover the jealousy which resisted not a few claims to restitution of territory. For some time, the B. of P. in Europe has been embodied, as it were, in a pentarchy or permanent congress of the five great powers, who mutually watch one another's movements. This mutual jealousy among the leading powers on the score of extension of boundaries, is looked to as the great safeguard of the smaller states, preventing their absorption by their powerful neighbors. It was the dread of a coalition against him that made the emperor of Russia agree to the treaty of 1841, and the Crimean war arose out of Russia's renewed attempt to extend her dominion over Turkey. Latterly, the doctrine of non-intervention has to a certain extent gained ground among politicians; and the formation of the kingdom of Italy, the results of the Franco-German war of 1870–71, and the formation of the German empire have modified the old ideas, and brought into play new combinations whose results can hardly yet be foreseen.

BALANCE OF TRADE. In the "mercantile system" of political economy, which looks upon the possession of gold as the grand aim, it not unnaturally came to be a maxim that a nation becomes richer just in proportion as the money value of its exports exceeds that of its imports; the excess, it was thought, being paid in gold, is just so much added to the national wealth. Now, the difference between the money value of the exports and imports of a state is called the "balance of its trade;" and by the adherents of the mercantile system, this balance was said to be "in favor" of the country or "against" it, according as the exports or the imports showed the excess.

But this view of the matter rests on a twofold error; for, in the first place, the increase of national wealth is by no means to be identified with the immediate influx of hard cash; nor is gold the highest expression of national wealth, but only a means of turning real wealth and the faculty of labor to account. Further, the assumption that excess of exports represents excess of income, is completely false. It takes exports for income (because payment is received for them), imports for expenditure (because they must be paid for), while it would be more consistent with the truth to say that exports are identical with expenditure, and imports with income; so that wealth increases in pro-

portion as the value of the imports (what is received) exceeds that of the exports (what is given away); and that whether these exports and imports consist solely of goods or partly of money. It may sometimes be desirable to get payment of exports in gold—that is, to import bullion. But the case in which this will be beneficial to the merchant seeking his own profit in the transaction, will be that in which it will be beneficial to the community. In the majority of cases, however, the individual merchant finds it his best policy to lay out the money due to him in a foreign country in purchasing the wares of that country as return-value. The far-sighted Venetians early recognized the truth of the principle in a national point of view; for, by a law of 1272, they laid a tax of one fourth the value on the importation of all coined gold and silver. The mercantile system of political economy, on the contrary, consistently following up the notion of the B. of T., enacted laws prohibiting importation of foreign manufactures, or imposing high duties upon them, and giving premiums and other protective encouragements for exportation; as if it were possible to go on exchanging always for gold only—ever exporting goods and goods alone, and never importing any. If this could be, and if it were true that a nation with the B. of T. constantly in its favor must become richer, while, with that balance against it, it must become poorer, England, whose official returns have for many years exhibited a large excess of exports over imports, must have had at this time about £500,000,000 in precious metals, while in reality the amount does not exceed perhaps £60,000,000. The truth is, that no safe conclusion can be drawn from the B. of T. exhibited in official statements; from the way in which they are arrived at, a great part of the facts of the cases are necessarily left out. Almost all nations exhibit favorable balances, and how could that be possible, if the whole affair were not deceptive? In the regular legitimate commerce between two nations, both actually gain, though the gain may not be exhibitable in the form of a money-balance. If the gains of nations from commerce consisted of differences between the amount of exports and of imports to be compensated by balances in money, nearly all nations would be yearly receiving accessions of gold and silver, the united amount of which would exceed, by more than ten times, the produce of all the mines in the world.

BA'LANUS, a genus of *cirrhopoda* (q.v.); the type of a family, including all those cirrhopods which are destitute of a flexible stalk, and of which the shell is symmetrical. These characters at once distinguish them from barnacles (q.v.). In the genus B. the base is usually formed of a thin calcareous plate, the sides of six valves; and four small valves form the operculum, exactly closing the aperture at the top. The name (signifying an acorn) was originally given by the ancient Greeks, from a supposed resemblance of some of the kinds to acorns; and acorn-shell has sometimes been adopted as an English name. There are many species, and they are found in almost all seas, attached to stones, timber, shells, crustaceans, etc. They cover the rocks between high and low water-mark on many parts of the coast as with a white calcareous incrustation, so that arithmetic fails in computing, and imagination in conceiving their multitudes. They may, however, be readily passed over as individually objects of little interest when they are seen after the tide has left them, for then their valves are closed, and they exhibit no sign of life; but if observed in a pool of the rocks, or anywhere under water, they present a very different and extremely pleasing spectacle, the opercular valves continually opening and shutting with a quick but pretty regular motion, and an exquisitely delicate apparatus of feathery arms or cirrhi (see CIRRHOPODA) being as frequently thrown out and retracted like a hand or a little net, to seize and carry into the mouth the minute nutritious particles or very small animals upon which the creature feeds. Thus, the little balani, immovably fixed to the rock, or carried about at the pleasure of mollusks or crustaceans to which they adhere, obtain their food from the waters around them.

A remarkable fact in the natural history of these creatures has recently been discovered by Mr. Thompson of Cork, that in the earlier stages of their existence they are not fixed as in their adult state, but move about very actively in a succession of bounds, by means of swimming-feet like those of the *cyclops* (q.v.); having, however, a shell, apparently of two valves, resembling a very minute muscle. Still more remarkable is the discovery made along with this, that in their early locomotive state they possess large stalked eyes, which disappear along with the organs of locomotion when they attach themselves—probably by the guidance of some peculiar instinct—to their final place of repose, undergoing a transformation into perfect cirrhopods, and acquiring as a covering their many-valved shell.

Some of the larger species of B. were esteemed a delicacy by the ancient Romans. The Chinese entertain the same estimation of *B. tintinnabulum*, which is said to resemble lobster in taste; and *B. psittacus*, a South American species, which is in like manner compared to crab, is exported in large quantities from Concepcion de Chili to Valparaiso and Santiago. This species is sometimes almost 4 in. in diameter, the height considerably more. It is chopped off the rocks with a hatchet. The two posterior opercular valves are beaked, from which it receives the name of *pico*, and its scientific trivial name, *psittacus* (a parrot).

BALASINORE', or BALASINESHWAR, a petty native state, or *jaghire*, of India, in the province of Guzerat, protected by the British government, and politically connected with the presidency of Bombay. It extends from n. lat. 22° 53′ to 23° 17′, and from e. long. 73°

17′ to 73° 40′, and contains an area of about 80 sq. miles. The river Mahi flows through the jaghire. The native ruler is styled nawab of Balasinore. He has a revenue of 41,548 rupees, of which he pays 10,000 rupees as tribute to the British government. The pop. of B. is estimated at 41,984. The nawab maintains a force of only 8 horsemen and 50 foot-soldiers, who are employed in revenue, police, and other services. The capital of the jaghire also bears the name of Balasinore. It is rather a thriving t. and is surrounded by a wall. It is 51 m. n. from Baroda.

BALASORE', a seaport in the district of Cuttack and presidency of Bengal, near the Boorabullung, which enters the sea to the w. of the Hoogly or Calcutta river. It is situated in lat. 21° 30′ n., and long. 87° e., and has dry-docks and a coasting-trade; but it is entitled to notice chiefly in connection with the past, having been the seat, successively, of Portuguese, Dutch, and Danish factories. It was only in 1846 that the Danes sold their interest in the place to the English.

BA'LATON, LAKE OF (Platten-See), a lake, the largest in Hungary, about 55 m. s.w. of Pesth. Its extreme length is 48 m., with a breadth of from 3 to 10 m., and an estimated area, including its frequently submerged marshes, of 420 sq. miles. Its greatest depth is 39 feet. It is supplied by upwards of 30 streams—the chief of which is the Szala—as well as by numerous springs which rise on its margin. Its outlet is by the Sio, which discharges itself into the Sarvitz, a feeder of the Danube. The waters of B. are clear and transparent, except when they are agitated by a storm, when they assume a bluish color. They have a slightly brackish taste. Fish of various kinds are found in abundance, and sand impregnated with iron, interspersed with which are small garnets, rubies, and other precious stones, is taken from it. Woods and vineyards cover the hills which encircle its northern sides, and on its banks near the t. of Füred there is a spring of acidulous water. The surrounding country is rich in rare plants and mineral treasures, and was the scene of several bloody conflicts during the Hungarian war (1848–49). The lake itself figures prominently in the old romantic ballads of the Magyars.

BALAUSTA. See BERRY.

BA'LAY, or BA'LAIS, the name now used to distinguish the ruby of a bright rose-color from the ruby proper, which is of a bright red or cochineal color, and from the *spinelle* ruby, which is of a red hue approaching to rose-color. This last kind of ruby has been recognized only in times which are comparatively modern. In the middle ages, they seem to have known only the B. ruby and the ruby proper, or *le beau rubis*, as it was often called. M. de Laborde thinks that the term B. was anciently employed as a name for all sorts of rubies.

BALBI, ADRIANO, well known by his geographical, and more especially by his statistical works, was b. in Venice on the 25th of April, 1782. In 1808, he gained so much credit in Italy by his first geographical work, that he was appointed professor of geography in the college of San Michele at Murano, and in 1811 professor of physics in the lyceum at Fermo. Subsequently he resided for a time in Portugal, and then went to Paris, to superintend the publication of his *Essai Statistique sur le Royaume de Portugal et d'Algarve* (2 vols., Par., 1822). This work was soon followed by the *Variétés Politiques et Statistiques de la Monarchie Portugaise* (Par., 1822). B. lived in Paris till 1832. He was the intimate friend of Malte Brun, from whose papers he, jointly with Larenaudière and Huot, published the *Traité Elémentaire de Géographie* (2 vols., Par., 1830–34). He also published several works of comparative national statistics. His *Atlas Ethnographique du Globe* (Par., 1826) is distinguished by its extensive accumulation of facts and views, giving an account of German researches on the subject, and entering into questions of comparative philology. B.'s best known work is, however, the *Abrégé de Géographie* (3d ed., Par., 1838), which has been translated into several languages. In the year 1832 he returned to Italy, and settled at Padua, where he died 14th Mar., 1848. A collection of his *Scritti Geografici* was made by Eugene Balbi (5 vols., Turin, 1841–42).

BALBI, GASPARO, a Venetian merchant of the 16th c., who is worthy of mention as the first traveler who has left an account of India beyond the Ganges. In the pursuit of his calling, B. was often led to Aleppo, and from thence, on one occasion, he made a visit to India, which lasted several years. After his return to Venice, he published, in 1590, the results of his travels in a volume entitled *Viaggio all' Indie Orientali*. A Latin translation was printed in De Bry's *Collection of Voyages and Travels to the East Indies* published at Frankfort in 1590–94. B. appears to have set down, without exaggeration, all that he himself saw, and is particularly minute and exact concerning commercial matters; but there is scarcely any limit to his credulity with regard to what he heard from others about the country. From Aleppo, his journey was down the Euphrates until opposite Bagdad; thence down the Tigris to Bassorah, where he embarked for the Malabar coast. Having visited Goa and Cochin, and other Portuguese settlements, he sailed for Pegu, then an independent empire, where he remained two years, returning by the same route. The most interesting part of his narrative is that relating to Pegu.

BALBI, GIOVANNI DE JANUA, or JANUENSIS, a Dominican friar of the 13th century. He wrote a cyclopædia which became one of the first of printed books, done at

Metz by Faust and Schaeffer, in 1460, and several times re-printed before 1520. Its full title is *Summa Grammaticalis Valde Notabilis quæ Catholicon Nominatur.*

BALBI'NUS, DECIMUS CÆLIUS, one of the two emperors of Rome whom the senate elected on hearing of the death of the elder Gordianus, and his son, in Africa, in opposition to Maximinus, who had the support of the legions in Germany. He was celebrated as an orator and a poet, and was a man of mild disposition. His coadjutor, Marcus Clodius Pupienus Maximus, was a bold and resolute soldier, who had risen from the people. They had only reigned a few months, during which time Maximinus had been killed by his own soldiers, who afterwards submitted to Maximus, when they were both killed in 242 A.D. by the pretorians, who at that time were animated by bitter hostility to the civilians, and extended it to the rulers who had been elected by them.

BALBO, CÆSARE, an Italian statesman and author, was b. 21st Nov., 1789, at Turin. When 18 years old, B. whose father had enjoyed the patronage of Napoleon, was appointed auditor of the council of state in Paris, and in 1812 he was made commissioner for the Illyrian provinces, ceded to France by the peace of Vienna. After the fall of Napoleon, B. went to London as secretary of the Sardinian embassy. After leaving political affairs, he devoted himself to the study of history, and among other works produced during the years 1821–43, were a *History of Italy*, which, however, extended only to the reign of Charlemagne; and a translation with commentary of Leo's *Development of the Constitution of the Lombardic Towns.* His *Speranze d'Italia* (Hopes of Italy), published in 1843, first extended his literary reputation to foreign countries. One of its main objects was to prove that national independence must precede the enjoyment of constitutional liberty; and that to strive after the latter, however good in itself, so long as the former had not been secured, was both foolish and reprehensible. It gave a vivid and intelligent picture of the political condition of Italy, its aims and prospects. His compendium of Italian history (*Della Storia d'Italia*, etc.) was also successful. B. took a prominent part as a moderate liberal in the political movements of 1847–48, and subsequently supported the ministry of Azeglio. He d. 3d June, 1853. He was a man of strict morality and unspotted character. In all his writings, B. adhered strongly to the Roman Catholic Church, whose truth he conceived to be the healing of nations as well as of individuals, and the only source of true culture.

BALBO'A, VASCO NUNEZ DE, a Spanish conqueror, was b. of a noble but reduced family at Xeres-de-Caballeros in 1475. After leading rather a dissolute life in his youth, he gladly took part in the great mercantile expedition of Rodrigo de Bastidas to the new world. He established himself in St. Domingo, and began to cultivate the soil; but fortune proving adverse, in order to escape from his creditors, he had himself smuggled on board a ship, and joined the expedition to Darien in 1510, commanded by Francisco de Enciso. It is curious to reflect that the man destined to discover the eastern shores of the largest ocean on the globe, should have been compelled to secret himself in a cask before he could share in the new enterprise. An insurrection which took place obtained for B. the supreme command in the new colony. Confused accounts which reached him of a great western ocean, impelled him, in 1513, to set out in quest of it. On the 25th of Sept. of this year, he obtained the first sight of the Pacific ocean from a mountain-top in the Isthmus of Panama. His natural enthusiasm at this great discovery was shared by all the educated men of his time, and the descriptions of it by contemporary authors may still be read with much interest. The governorship of the territories conquered by B. was obtained in 1514 by Pedrarias Davila, by means of his intrigues at the Spanish court. B. resigned the command into the hands of the new governor, a narrow-minded and cruel man, and, in a subordinate situation, undertook many successful expeditions; but these, and all his other merits, only served to increase the hatred of Pedrarias Davila towards him. The government of the mother-country sought in vain to mediate between them, and B. even married the daughter of Pedrarias. But on the first occasion of dispute which arose, B., having been induced by Pedrarias to deliver himself up, was accused of a design to rebel, and in violation of all forms of justice was beheaded at Santa Maria in 1517.

BALBRIG'GAN, a small maritime t. in Dublin co., 22 m. n. of Dublin. It is a seat of cotton, calico, and stocking manufactures. The cotton stockings made here are remarkable for fineness of texture and beauty of open work. Many females are employed in embroidering muslins. B. is a favorite watering-place. After the battle of the Boyne, William encamped here. Pop. '71, 2332.

BALBUE'NA, BERNARDO DE, 1568–1627; a Spanish poet and priest, educated in Mexico, and bishop of Porto Rico. His chief works are *The Age of Gold*, a pastoral romance; and *El Bernardo*, an epic poem.

BALBUS, LUCIUS CORNELIUS (MAJOR), b. Spain; made a Roman consul, and accompanied Cæsar to Spain, 61 B.C.; managed Cæsar's private property while the owner was in the campaign in Gaul. Octavius made him a consul, the first adopted citizen who held that office. He wrote a diary of his life, and by will left 20 denarii (nearly $3 present value) to every Roman citizen.

BALBUS, LUCIUS CORNELIUS (MINOR), nephew of B. major; appointed pontiff (a high priest of the pagan religion) by Cæsar. He was quester in Spain, but used his

office for fraud and oppression; fled to Africa, where he became pro-consul; gained a victory, and was honored with a triumph in Rome—the first bestowed on an adopted citizen.

BALCONY (Ital. Balcone), a projecting gallery in front of a window or of several windows, with a balustrade or parapet before it, and supported by consoles, or brackets fixed in the wall, or by pillars resting on the ground below. The B. was unknown in Greek and Roman architecture, and is probably an Italian contrivance, as the earliest examples of it occur in Italy, to the climate of which country it is peculiarly adapted. Balconies constructed of wood are of constant occurrence in the cottage architecture of Switzerland, to the picturesque character of which they add very essentially.

BALCONY, the gallery or stern-walk outside the stern of a large ship. Three-deckers have two such balconies, and two-deckers one. Where there are two, the lowermost is connected with the admiral's state-cabin, and the uppermost with the captain's cabin.

BAL'DACHIN (Ital. *baldachino*), signifies a kind of canopy, of the form of a tent or umbrella, made of costly materials and richly adorned, which is either supported on pillars, or fastened to the wall over a throne or couch, or over a pulpit, an altar, or other sacred object. One of the most celebrated is the B. in the church of St. Peter's in Rome, cast in bronze by Bernini, which is supported on four large twisted colums. B. was also the name formerly given to a kind of umbrella of a square form, made of silk brocade or other rich material, and supported on four poles, which was wont to be carried in the middle ages at solemn processions, coronations, marriages, etc., over the heads of royal personages or high dignitaries as a symbol of their rank. In Europe, the B. is now chiefly used in the processions of the Roman Catholic church. It is generally borne over the priest who carries the host. The word B., as well as the thing itself, comes from the east. Partly as a protection from the burning rays of the sun, partly as a symbol of their power and dignity, the rulers and great personages of the east seldom appeared in public, whether on foot or on horseback, in a litter or on an elephant, without a splendid canopy, often borne by the great men or chief officers of their kingdom. These canopies, generally made in the form of a tent or umbrella, were often sent, in the early part of the middle ages, as presents from eastern princes to those in the west; as, for example, from the caliph Harun-al-Raschid to Charlemagne. During the crusades, and the consequent trade with the east, they became well known to the Italians. Such canopies, as well as the rich stuffs of which they were made, were called, from the land whence they came, Babylonica; and also Baldachins, from Baldach, the eastern name of the city of Bagdad.

BAL'DE, JAKOB, a Latin poet, 1603–68, a native of Alsace. He was a Jesuit, and for a time court preacher and professor of rhetoric at Munich. He was especially successful as an imitator of Horace.

BALD (or WHITE-HEADED) EAGLE, *Haliaëtus leucocephalus*, so named because the white smooth feathers of the head make it appear as if naked; a native of North America, found near the sea-coast and in mountain chains; sometimes more than three feet long, with wings spreading seven or eight feet. The female lays two or more eggs in Jan., which are hatched the next month. She uses the same nest, usually in a high tree, year after year, and will stoutly defend her young. The B. E. is omnivorous, but especially fond of fish, which it catches, but oftener steals from smaller fishing birds. This is the bird that figures upon coins and flags as the emblem of the American union.

BALDER, or BALDUR, a divinity worshiped by the ancient Scandinavians, and probably also by the other Germanic nations, is the hero of one of the most beautiful and interesting of the myths of the Edda. B., who, according to old northern mythology, was the second son of Odin and Frigga, and the husband of Nanna (maiden), dreamed evil dreams which threatened his life. When he related them to the gods, they held a council and endeavored to secure his safety. Frigga took an oath from fire and water, from iron and all metals, from stones, earth, and plants, beasts and birds, the serpent, poison and all diseases, that they would not harm Balder. After this was done, the gods in their mirth sported with B., wrestled with him, and cast darts at him, but nothing could injure him. While the gods rejoiced at this, the thing displeased Loki (mischievous cunning or destructive fire). He changed himself into the form of an old woman, and inquiring the cause of the invulnerability of B., was told by Frigga that all things, animate and inanimate, had sworn not to harm him, with the exception of one little shrub, the mistletoe. Loki went in haste to fetch this shrub, and repaired with it to the assembly of the gods, where he placed it in the hands of the blind Höder, the god of war, directed his aim, and B. fell pierced to the heart. The sorrow of the gods was unutterable. Frigga asked who, to win her favor, would journey to Hel—the goddess of Hades or the grave—to release Balder. Hermoder or Helmod (the heroic), the son of Odin, readily offered his services, and Hel consented to grant his request on condition that all things should weep for Balder. All men, all living beings, and all things wept, save the witch or giantess Thöck (the step-daughter of Loki), who refused to sympathize in the general mourning. B. was therefore obliged to remain in the kingdom of Hel until the end of the world.

The myths of B. have been very differently interpreted. B., as the originator of all

that is beneficent and good—for B. and the other *sons* of Odin (see SCANDINAVIAN MYTHOLOGY) are only personified aspects or functions of the dimly-conceived one unseen Power that moves all nature—is represented as a hero of so lovely and graceful a manly beauty, that a brilliant light streams from his person; the whitest of the northern flowers is named *Balders-brow*. As the god of peace of the Germanic nations, who conducts to peace through battle and victory, he is a purely ethical conception, a mythical personification of the peace obtainable through conflict, and agreed to by compact among the gods. The gods, foreseeing doubtless that peace cannot long endure, seek in every possible way to secure the precious life of B., as even the weakest and most insignificant have it in their power to destroy peace. Loki, in his symbolical character as the god of retributive justice, stirs up Höder, or War, through whom the god of peace falls. Höder, indeed, is also slain by Wali, or Val-fader, the battle-god, and the war is ended by a bloody overthrow; but once violated and broken, peace is irrevocably lost along with Balder. Hermoder or Helmod labors in vain to restore it, for the giantess Thöck (retaliation, revenge) prevents it. Holy and true peace can only revive again in a new world, when the old sinful world and the old guilt-stained gods now ruling it shall have been destroyed.—Others (among them Max Müller) see in the myth of B. a representation of the contest between winter and summer. Compare Weinhold, *Die Sagen von Loki*, in Haupt's *Zeitschrift für Deutsches Alterthum* (Leip., 1849).

BALDI, BERNARDINO, 1533–1617; an Italian mathematician and author. He was master of more than a dozen languages, and wrote upwards of 100 different works. He was an abbot for 25 years, and on one occasion was envoy to Venice. B. had great reputation as theologian, mathematician, geographer, antiquarian, historian, and poet.

BALDNESS, *Alopecia*. See HAIR. There are some rare cases on record in which the hair has never been developed. This is termed *congenital baldness*.

Accidental baldness may involve the whole scalp, or may be only in patches; these patches may run into each other, and hence some consider this condition a species of ringworm. It is caused, says Mr. Erasmus Wilson, by an atrophy of the hair-follicles (q.v.). B. in the comparatively young and middle-aged may occur from wearing waterproof caps, which, by preventing evaporation from the head, occasion an unhealthy state of skin. Naval and military officers are liable to B. arising from this cause.

Senile baldness (calvities) is not necessarily the consequence of age; it may arise, like the preceding variety, from an atrophy of those parts on which the hairs depend for nutrition. It generally commences on the crown of the head, where the supply of blood is naturally less abundant. Women have a greater quantity of soft tissue under the skin, therefore the vessels are less likely to be interfered with; hence they are not so frequently bald as men.

The causes of B. are the defective supply of nutrition just mentioned, a family tendency, late hours, dissipation, but especially old age. The hair falls off after severe illness, or after other causes of general debility. During pregnancy the hair falls out; and in this country we often see the long hair of young women, victims to consumption, almost completely shed.

Treatment of baldness consists in attention to cleanliness, and in exciting the languid circulation of the scalp to greater activity, by using a hard hair-brush, and the application of stimulants, as the Spanish-fly ointment in the proportion of two drachms to an ounce of lard mixed with about the same quantity of pomatum. Or the stimulants may be applied in the form of lotions. But at the same time constitutional debility should be remedied by attention to the various functions of the body; tonics should be administered; and, if possible, causes of anxiety or night-watching should be avoided. Shaving the whole head is sometimes resorted to. If these remedies are successful, downy white hair, like that of an infant, begins to grow, which may or may not acquire the color and vigorous appearance of the former growth.

BALDO, MONTÉ, a mountain of Lombardy, on the e. of lake Garda, with an elevation of 7100 ft. It contains interesting petrifactions, and the fine green sand known as the sand of Verona.

BALDPATE, or AMERICAN WIDGEON, *Mareca Americana*, a duck much prized by epicures, found chiefly in the s.w. states, on the w. coast, and about the great lakes. It is named from its white-tipped head; and is marked with brown, chestnut, gray, or white.

BALDRICK, or BAUDRICK (Fr. *baudrier*), is a band or sash worn partly as a military and partly as a heraldic symbol. It passes round the waist as a girdle, or passes over the left shoulder, and is brought down obliquely under the right arm, or is suspended from the right shoulder in such a way as to sustain a sword. Many of the effigies of knights contain representations of the B., more frequently as a belt than a shoulder-sash. Queen Victoria frequently wears a blue silken B. on state occasions. The name is derived from the *balteus* of the Roman soldier.

BAL'DUNG, HANS, called also Hans Grün, a German painter and wood-engraver, a contemporary of Albert Durer, to whom, in expression, coloring, and finish, he was little inferior as a painter. He was b. in Gmünd, Swabia, about 1470, and d. at Strasburg in

1552. His masterpiece, a painting of the crucifixion, is in the cathedral of Freiburg; his wood-engravings are numerous.

BALDWIN, a co. in s. Alabama, on Perdido river, the gulf, and Mobile bay; intersected by the Mobile and Montgomery railroad; 1500 sq.m.; pop. '80, 8,446—3,702 colored. The surface is level and sandy, but supports a fine growth of pine timber. Co. seat, Blakely.

BALDWIN, a co. in central Georgia, on the Oconee river; 257 sq.m.; pop. '80, 12,998—9,140 colored. It produces corn, cotton, wheat, and sweet potatoes. Co. seat, Milledgeville.

BALDWIN, name of counts of Flanders, from the 9th to the 12th century. Baldwin I. was son-in-law of Charles the bald of France; Baldwin V. was son-in-law of Robert of France; Baldwin IX. became Baldwin I., emperor of Constantinople.

BALDWIN I., the first Latin emperor of Constantinople, was b. at Valenciennes in 1171 A.D., his parents being Baldwin, count of Hainault, and Margaret, countess of Flanders. In 1193, he succeeded to his mother's possessions, and in the year following, to the title and county of his father. In 1200, he appointed his brother Philip, along with other persons, to the regency of Hainault and Flanders, and joined the fourth crusade. Part of the crusaders—B. among others—were induced to assist the Venetians in reconquering Zara, in Dalmatia, from the king of Hungary. While at Zara, the young Alexis, son of Isaac II., emperor of Constantinople, craved the assistance of the crusaders against his uncle Alexis Angelus, who, having deposed and blinded Isaac II., had usurped the throne. In return for their aid, he promised them a liberal sum of money, and also to help them to recover Palestine. The crusaders agreed, and soon defeated the usurper's forces, and restored the rightful emperor; but Alexis having some difficulty in carrying out his promises, they turned their arms against him. A revolution breaking out in the city at the same time, Alexis the younger was murdered, and his father is said to have died of grief. Alexis Ducas Murzuphlus then usurped the throne, but was defeated by the crusaders, and the city was sacked—the crusaders and Venetians sharing the booty. B. was chosen emperor, and crowned on the 9th May, 1204; but he received only about a fourth part of the empire—Constantinople and Thrace—the Venetians obtaining the greater share of the provinces. A part also fell to the French adventurers who accompanied the expedition, and several provinces remained in the hands of Greek princes. The abilities of B.—and they appear to have been of a superior character—were not able to cope with the evils necessarily attending so anomalous a position. The Greeks were discontented, and, backed by Calo-Joannes, king of Bulgaria, while B.'s brother, with the flower of his troops, was away on an expedition in Asia, they rose and massacred the Latins scattered throughout the towns of Thrace, and made themselves masters of Adrianople. B. laid siege to the town with the forces he had at his disposal; but he was defeated and taken prisoner by the Bulgarian king, and died about a year after (1206) in captivity. He was succeeded by his brother Henry.

BALDWIN II., Emperor of Constantinople, was b. in 1217. He was the son of Peter de Courtenay and Yolanda, countess of Flanders, sister of Baldwin I. Being but 11 years old when, by the death of his brother Robert, he succeeded to the throne, he was placed under the guardianship of John of Brienne, titular king of Jerusalem, who died about 1237. B. then assumed the rod of empire, but he had neither the means nor the ability to wield it successfully against his powerful Greek and Bulgarian opponents. Two begging-visits to western Europe, in one of which he left his son Philip in pledge at Venice for a debt, and disposed of several most holy relics for money, were not successful in procuring him sufficient forces to resist his foes; and on the night of the 15th of July, 1261, his capital was taken by one of the generals of Michael Palæologus, ruler of Niceæa, and B. fled to Italy. With him terminated the Latin empire in the east, after it had lasted 57 years. His descendants for more than a century retained the title of emperor.

BALDWIN I., King of Jerusalem, 1100–1118, was b. in 1058. He was the youngest brother of Godfrey de Bouillon (q.v.), duke of lower Lorraine or Brabant. He took part in the first crusade; but having quarreled with Tancred, he retired to Edessa, at the request of the Christian inhabitants of the place, and was soon after elected to be count of Edessa. After the death of his brother Godfrey, in 1100, he became protector of the holy sepulchre, and baron of Jerusalem, and immediately assumed the regal title, which his brother had refused. He conquered Cæsarea, Ashdod, and Tripolis, and with the assistance of a Genoese fleet he became master also of Acre, and subsequently of Sidon, but failed to reduce Ascalon. He d. in 1118. Unlike his brother, who was a disinterested enthusiast, B. was worldly and ambitious.—BALDWIN II. (Baldwin du Bourg), cousin of Baldwin I., who had made him count of Edessa when he ascended the throne of Jerusalem, succeeded him, and reigned from 1118 to 1131. During his reign Tyre was taken, in 1124, with the assistance of a Venetian fleet; and the order of the Templars was instituted. Having been taken prisoner by the Turks, B. endured a captivity of six months. He d. on the 21st of Aug., 1131, leaving four daughters. Shortly before his death he resigned the crown in favor of his son-in-law, Foulques of Anjou, who reigned till 1134.—BALDWIN III., king of Jerusalem, 1143–1162, the son and

successor of Foulques of Anjou, was b. in 1129. He was a model of knighthood, which, during the period of the first crusades, was a personification of honor, justice, devotion, and love. Edessa was lost to the Christians during his reign. In 1152, he fought victoriously at Jerusalem against Noureddin, the sultan of Aleppo. In 1157, after he had defeated the same prince at Jacob's ford, on the Jordan, he again humbled him severely near Putaha. After this, he ruled in peace, and endeavored to improve both the external and internal defenses of his kingdom. The authority and influence of B. were so great, that even Saracens followed under him the banner of the cross. By his marriage with Theodora, the daughter of the Greek emperor Manuel, he gained a faithfully ally in that prince. He d., it is believed, of poison, in the flower of his age, at Tripolis, in Syria, on the 10th of Feb., 1162. With his death the Christian power in the east began to decline. He was succeeded in the government by his brother Amalric or Amaury, who d. in 1173.—BALDWIN IV., the son and successor of Amalric, surnamed the Leper, reigned till 1183.—When a child of 5 years old, BALDWIN V., the son of Sybilla, sister of Baldwin IV., was called to the throne. He d. in 1187, a year before Jerusalem was retaken by Saladin.

BALDWIN, JOHN DENISON, b. Conn., 1809; a journalist; educated by his own exertion, and licensed to preach in 1833. He wrote for magazines on archæology and kindred themes; became editor of the *Charter Oak*, a Hartford newspaper; afterwards of the Boston *Commonwealth*, and, still later, of the Worcester *Spy*. He has been three times chosen member of congress. In 1847, he published a volume of poems; in 1859, *Prehistoric Nations;* and in 1872, *Ancient America*.

BALDWIN, MATTHIAS W., 1796–1861; b. N. J.; a machinist; recorded as the builder of the first railway locomotive in this country; he subsequently built locomotives on an extensive scale in Philadelphia.

BALDWIN, THERON, D.D., 1801–70; b. Conn.; graduated at Yale; was home missionary of the Congregationalists in 1829; one of the founders of Illinois college; organizer of the Monticello female seminary, of which he was principal, 1838–43; and 27 years secretary of the society for promoting collegiate and theological education, in whose service his work was of great value. In his latter years he resided at Orange, N. J.

BALDWIN'S PHOSPHORUS is a term applied to the nitrate of lime, which, on evaporation, parts with its water of crystallization, and then, as discovered by Baldwin in 1675, assumes a luminous appearance in the dark.

BALE, JOHN, Bishop of Ossory, in Ireland, was b. at the village of Cove, in Suffolk, in Nov., 1495. He was educated as a Carmelite monk, but afterwards turned Protestant, and, being persecuted by the Roman Catholics, fled to Flanders, where he remained eight years, during which he wrote numerous works. He was recalled by Edward VI., and successively presented to the living of Bishopstoke, in Hampshire, and the bishopric of Ossory. In this latter sphere he made himself so obnoxious to the Catholics by his zeal in the Protestant cause, that on news of the death of Edward, his house was attacked, and five of his servants killed. He himself escaped out of the country after great difficulty, and the loss of all his effects. On the accession of Elizabeth he returned to England, and was made a prebend in the cathedral of Canterbury. He died in 1563. His fame mainly rests on a collection of British biography, which, notwithstanding that sections of a book are not unfrequently set down in it as distinct works, and that the names of persons who never wrote anything are set down as authors, is a valuable work. It was first published in 1548 under the title of *Illustrium Majoris Brittaniæ Scriptorum, hoc est, Angliæ, Cambriæ, et Scotiæ Summarium.*

BÂLE. See BASEL.

BALEARIC ISLES, a group of five islands—Mallorca (Majorca), Minorca, Iviza, Formentera, Cábrera—lying off the coast of Valencia, in lat. 38° 4′ to 40° 5′ N., and long. 1° to 5° E. They at one time formed the kingdom of Mallorca, which was united in 1289 with the crown of Aragon. They now form a Spanish province, and have unitedly an area of 1753 sq.m., with a pop., in '70, of 289,225. The soil generally is good. Vines, olives, and other fruit-trees are cultivated abundantly; but corn has to be imported. The coasts are precipitous, with some excellent harbors—Port Mahon, in Minorca, being one of the finest in Europe. The Phenicians visited the B. I. at a very early date, and they were followed by the Greeks, from one or other of whom they are said to have received their name. If from the Phœnicians, the name is derived from a Phenician word equivalent to the Greek *gymnetas*, signifying light-armed troops; if from the Greeks, then it is from *ballein*, to throw, and was given because of the expertness of the natives in using the sling, to the use of which they were trained from their infancy. Later, the B. I. became subject to Carthage; but after a short period of freedom, during which their inhabitants became pirates, were annexed to the Roman empire by Metellus (*Balearicus*), 123 B.C. From that time their history is involved in that of the peninsula. See SPAIN.

BALÉCHOU, JEAN JAQUES NICOLAS, 1715–65; a French engraver, whose best work is a full-length portrait of Augustus III. of Poland. He also made some fine plates after Claude, Vernet, and Vanloo.

BALE-FIRE. See BEACON.

BALEN, or BALLEN, HENDRIK VAN, 1560–1632; a painter of Antwerp, pupil of Adam von Oort, the teacher of Rubens. He finished his studies in Italy, and became instructor of Vandyke and Snyders. Some of his altar pieces are in the Antwerp cathedral.

BALESTRA, ANTONIO, an Italian painter, 1666–1740. He was one of the last great representatives of the Venetian school, and a member of the academy of St. Luke, in Rome, which gave him a prize for his "Defeat of the Giants."

BALFE, MICHAEL WILLIAM, an English composer of operas, etc., was b. May 15, 1808, in Dublin. His musical talent received early culture, and several anecdotes are related of his singular precocity. When only seven years old, he played publicly one of Viotti's concertos for the violin. At nine, he wrote the ballad entitled *The Lover's Mistake,* which achieved popularity through the singing of Madame Vestris. At sixteen, he made his début in London, at the Drury lane theater, as conductor of the orchestra. In 1825, he left this situation, in order to visit Italy, where he studied counterpoint under Frederici at Rome, and singing under Felippo Galli at Milan, and began his successful career as a composer, with music for the ballet *La Peyrouse* performed at the theater La Scala, in Milan. In 1827, he returned to the stage and sang in the Italian opera at Paris, where, in concert with Malibran and Sontag, he gained great applause, and many warm friends. He, however, returned to Italy, and devoted himself to composition, producing in rapid succession the operas—*I Rivali* (1829), *Un Avvertimento* (1830), *Enrico IV.* (1831), *Siege of Rochelle* (1836), *Maid of Artois* (1836), *Joan of Arc* (1837), *Falstaff* (1838), *Keolanthe* (1841), *The Bohemian Girl* (1843), *Les Quatre Fils Aymon* (1844), *The Bondman* (1846), *The Maid of Honor* (1847), *The Sicilian Bride* (1852), *The Rose of Castile* (1857), *Blanche de Nevers* (1860), *The Puritan's Daughter* (1861), *The Armorer of Nantes* (1863), and others. *Il Talismano* first saw the light in June, 1874, nearly four years after B.'s death, which happened on Oct. 20, 1870; and is perhaps his greatest work. Of the others named, *The Bohemian Girl* and *The Rose of Castile* have been most permanently successful. If B. was not a very original writer, he had a very thorough knowledge of effect and command of orchestral resources; and his compositions are distinguished by fluency, facility, and melodic power. See Kenney's *Memoir of Balfe* (1875).—His daughter, Mdlle. Victoria Balfe—who became duchess of Frias in Spain—was for some years a very acceptable public singer both in England and on the continent. She died in 1871.

BALFOUR, Sir JAMES, lord president of the court of session, and author of an able book, *Practicks of Scots Law,* was a son of Sir Michael Balfour of Pittendreich and Montquhany, in Fifeshire. In early life, he was implicated in the conspiracy against cardinal Beaton, and being in the castle of St. Andrews when it surrendered, in 1547, he was carried prisoner to France in the same vessel with John Knox. About two years after, returning to Scotland along with other of his fellow-prisoners, he changed his religion, his apostasy gaining for him the appellation of the "Blasphemous Balfour" from Knox, but unusual honors and emoluments from the queen and court. B. was sagacious enough to notice the increasing influence of Bothwell, and he immediately insinuated himself into his confidence, joined the conspiracy for the assassination of Darnley, and framed the bond for mutual support, signed by the conspirators. He was afterwards accused by lord Lennox as an accomplice in the murder of Darnley, but the trial was hurried over before proof of his guilt could be brought forward. In 1567, at the instance of Bothwell, he was appointed governor of Edinburgh castle; and he repaid the kindness of that nobleman and the queen, by handing over to the confederate lords the celebrated letters upon which they endeavored to found Mary's guilt, and which had been given him by Bothwell for safe custody. He afterwards surrendered the castle to Murray, on certain conditions, in which his own safety and interests were the chief considerations. The great object of B.'s life appears to have been self-aggrandizement, without regard to the means by which that was accomplished. Accordingly, we find him the recipient of favors under the regency, as he was under the queen. He was made a privy-councilor, commendator of the priory of Pittenweem; and in exchange for the clerk-registry, he received the lord presidentship of the court of session, and a pension of £500. When Morton was made regent, B. contrived to curry favor with him, and received from him a commission to make a general digest of the law. Not feeling himself safe in Scotland, however, he left it for France, where he remained for some time. When the young king ascended the throne, he joined the party hostile to Morton, but again fled to France, when in 1579 Morton recovered his authority. In 1580 he returned, and was instrumental in obtaining Morton's death, by producing the deed compassing the murder of Darnley, which that nobleman, along with others, had signed. He died in 1583.

BALFOUR, ROBERT, b. about 1550; a Scotchman, who was for many years principal of the Guienne college, at Bordeaux; author of a *Commentary on the Logic and Ethics of Aristotle.* B. was one of the scholars of the middle ages who helped to spread over Europe the literary fame of Scottish writers.

BALFOUR, WALTER, b. Scotland, 1776; d. Mass., 1852; educated in the Scottish church, but became a Baptist; and finally a Universalist, advocating with great ardor and success the doctrines of that sect.

BALFRUSH (or more correctly BARFURUSH, "mart of burdens"), an important commercial t. in the Persian province of Mazanderan, and situated on the river Bahbul, about 12 m. from its mouth in the Caspian sea. The river, which is here about 50 yards broad, but shallow, is crossed by a fine stone bridge of 8 arches. It is not navigated, all goods being landed at the port of Mesh-hedi-Ser, on the Caspian, from whence they are conveyed to B. by an excellent road. To the s. of the town there is an artificial island, about half a mile in circumference, on which the palace of Shah Abbas formerly stood. B. has excellent bazaars, and several Mohammedan colleges; the pop. is variously estimated at from 50,000 to 200,000. The latter estimate was made by Fraser, who visited it in 1822, since which time it has been greatly depopulated by plague and cholera. Flax and cotton are much cultivated in the vicinity.

BALGUY, JOHN, 1686–1748; an English theologian and philosopher, graduated at Cambridge, and ordained in 1710. B. was early in the warm religious controversies of the time, taking the side of Hadley against the high-church writers. In 1728, Hadley made him prebend of Salisbury, and the next year he became vicar of Northallerton. His chief works are, *Letters to a Deist, Foundation of Moral Goodness, Inquiry Concerning Virtue, Divine Rectitude, The Law of Truth,* and *Essay on Redemption.*

BA'LI, an island e. of Java; area, 2300 sq.m.; pop. 760,000. B. is volcanic—its highest mountain, 12,379 ft., having been an active volcano as late as 1843. Agriculture is the chief employment. The inhabitants grow rice, indigo, cotton, fruits, maize, and edible roots, and possess buffaloes and cattle. Fish is plentiful. Coffee culture is extending; and in 1873 its export from Bolêlêng, the trading capital, reached 21,040 cwts., valued at £58,333. B. is well situated for trade. The Balinese are a superior race, and speak a language related to Javan. They excel as sculptors, and in working gold, silver, and iron. Their legion is Brahmanism. Under the Dutch, the eight kingdoms are governed by native rulers. Chinese and a few Europeans are the chief traders.

BALIOL, EDWARD, son of John, makes himself momentarily conspicuous in history by his daring and successful invasion of Scotland, then under the regency of Randolph, earl of Moray, in 1332. Accompanied by some English noblemen bent on recovering their forfeited estates in Scotland, he landed with a few hundred followers at Kinghorn, in Fifeshire; defeated the earl of Fife; pushed boldly into the country; and on Dupplin moor, in Perthshire, routed with immense slaughter an army upwards of ten times more numerous than his own. On the 24th of Sept., seven weeks from the date of his landing, he was crowned king of Scotland at Scone. He had only enjoyed the kingly dignity for about three months, when he was surprised in his camp at Annan, and nearly lost his life as well as the crown he had so recently assumed. His subsequent career is the very reverse of what might have been anticipated from so adventurous a beginning, being marked only by weakness, servility, and misfortune. He died at Doncaster in 1363, and with him ended the house of Baliol.

BALIOL, JOHN, Lord of Galloway, and afterwards King of Scotland, was b. in 1259, and on the death of the princess Margaret in 1290, became a competitor for the crown of Scotland. As the grandson of the eldest daughter of David earl of Huntington, brother of William the lion, his claim was pronounced superior to that of the other principal competitor, Robert Bruce, lord of Annandale, son of the second daughter. The arbiter on the occasion was Edward I. of England, who found this a fit opportunity for asserting his claim as lord-paramount of Scotland. That claim was acknowledged by the Scottish estates in submitting the contest to his decision; and, consistently with this ignominious submission, B., before and after receiving the crown (Nov. 30, 1292), swore fealty to Edward as his feudal superior. He was soon made to feel that his sovereignty was merely nominal, and, abject as he had shown himself, the indignities which he experienced at length roused him to an assertion of his rights as king. In 1295 he took upon him, by the advice of his nobles, to conclude an alliance with France, then at war with England. This act of revolt was followed by speedy chastisement. Edward invaded Scotland with a large force; defeated the Scottish troops; took B. prisoner, and compelled him, after performing a humiliating penance, formally to surrender his crown, July 2d, 1296. B. was confined for three years in the Tower, enjoying, however, a limited freedom, and something of royal state. At the end of that time he was permitted to retire to his patrimonial estates in Normandy, where he died in 1314, a short time after the battle of Bannockburn. The estimate by his subjects of this unfortunate and poor-spirited prince was significantly indicated by the surname of "Toom Tabard," or Empty Jacket.

BALIOL COLLEGE. See BALLIOL COLLEGE, *ante.*

BALIS'TA, or BALLIS'TA (Gr. *ballein,* to throw), was one among the larger kinds of military weapons in use before the invention of gunpowder. The *B.*, the *catapulta,* the *scorpion,* and the *onager,* propelled large and heavy missiles, chiefly through the reaction of a tightly-twisted rope of hemp, flax, catgut, sinew, or hair; or else by a violent movement of levers. The scorpion was a kind of large crowbar; the B. threw stones; the catapulta threw heavy darts or arrows, and was somewhat smaller than the B. One man could manage the scorpion, but two or more were needed for the B. or the catapulta. There was a good deal of mechanism necessary to bring about the propulsive

force. The makers of those machines were very particular in the choice of women's hair, the sinews of a bull's neck, and the tendons of the deer, wherewith to fashion the elastic cord. The onager was a kind of B., which threw a stone by the agency of a sling instead of a stretched cord. The early chroniclers tell of catapultas that would throw an arrow half a mile, or hurl a javelin across the Danube; and of a B. which threw a stone weighing 360 lbs. Numerous other weapons of an analogous character were known in the middle ages—such as the *mangonel;* the *trebuchet*, which threw a large stone by the action of a lever and a sling; the *petrary*, which, as its name implies, threw a stone; the *robinet*, which threw darts as well as stones; the *mate-griffon* and *mate-funda*, both slinging-machines; the *tricolle*, which hurled quarrels, or square-headed arrows; the *espringal* or *springal*, which threw large darts; the *ribaudequin*, a large kind of cross-bow; the *war-wolf*, a stone-throwing machine, etc. The arbalest (q.v.) may be regarded as a small portable arrow-throwing Balista.

BALIS'TÉS, or FILE-FISH, a genus of osseous fishes of the order *plectognathi* (q.v.) of Cuvier; the type of a family, *balistidæ*, the species of which are almost all inhabitants of tropical and subtropical seas, frequenting rocky coasts and coral-reefs. Their colors are generally brilliant. The body is remarkably compressed. The ossification of the skeleton, as in the other plectognathi, is very incomplete, and the external covering of the body resembles that of the ganoid (q.v.) fishes, consisting, in some of the genera, of large rhomboidal scales, disposed in regular rows, and not overlapping; in others, of very small rough scales, with stiff bristles, as densely crowded as the pile of velvet. But the most interesting thing in connection with these fishes is the provision for fixing the first dorsal spine in an erect position, or lowering it at the will of the animal. The spine is articulated "by ring and bolt to the broad interneural osseous plate." "When the spine is raised, a depression of the back part of its base receives a corresponding projection from the contiguous base of the second ray, which fixes it like the hammer of a gun-lock at full cock, and it cannot be let down until the small spine has been depressed, as by pulling the trigger; it is then received into a groove on the supporting-plate, and offers no impediment to the progress of the fish through the water. This trigger-like fixing of the spine takes place also in the dead fish; and when a B. is removed from the bottle for examination, it is generally necessary to release the spine by pressing on the small trigger-ray." The spine is roughened with enamel grains, whence the name file-fish. The flesh of these fishes is generally regarded as unwholesome.

BALISTRA'RIA (Ital. *Balestriera*), one of the names given to those narrow apertures so often seen in the walls of old castles, and through which the cross-bowmen discharged their arrows. See BALISTA. B. do not seem to have come into use till the 13th century. The lower terminations of B. are generally circular, sometimes in the form of a shovel. See LOOPHOLES.

BALIZE, BELIZE, or BRITISH HONDURAS, a British colony on the bay of Honduras, in the Caribbean sea, extending in n. lat. from 16° 45′ to 18° 30′, and in w. long. from 88° 10′ to 89°. It forms the s.e. part of the peninsula of Yucatan, which here divides the Caribbean sea from the gulf of Mexico. Its area is 13,500 sq. miles. In 1870, the pop. was 24,710—377 white, and 24,333 colored; nearly half of the whole being in the town of B., which stands at the mouth of a river also of the same name. The Balize traverses the middle of the country for about 200 m., and the Rio Hondo and Siboon form respectively its n.w. and s.e. boundaries. The early British settlers were frequently attacked by the Spaniards; but since 1798, when they repulsed a fleet and land-force of 2000 men, their occupation has been formally acquiesced in. Since 1862, B. has ranked as a British colony, and has had a governor and local magistrates. The country has a general tropical fertility, but its chief exports are mahogany, sugar, coffee, cotton, India-rubber, and logwood with other dye-stuffs. B., the capital, is a depot for British goods for Central America, and has a varying pop. of 8000 to 15,000.

BALIZE (from *balise*, "a beacon"), a village near the mouth of the Mississippi, inhabited chiefly by pilots. Reporting a vessel "at the Balize" means that she is at, or has passed, the mouth of the river.

BALKAN', or HÆMUS, the eastern branch of that mountain-system which comprehends the ranges of Montenegro, Herzegovina, and the Dinaric Alps. It extends from the plain of Sophia to cape Eminch, on the Black sea, and forms the southern boundary of the basin of the Danube, and dividing the principality of Bulgaria from Eastern Roumelia. Its highest summit, Tchat-al-dagh, is 8340 ft. above sea-level; but the general height of the range is about 4000 feet. Toward the Black sea, the mountains become lower, and diversified with wooded slopes. They send several offshoots n. and s., and are of great strategical importance in the defense by Roumelia. The chief route across them is that of Trajan's Gate, which connects Constantinople with the w. of Europe. The attempt by the Turks to regain possession of the Shipka pass was one of the fiercest contests of the war of 1877.

BALKASH', or TENGIZ' (Tenghíz or Tenguíz), a lake near the eastern borders of Russian Central Asia, lat. 45° and 47° n., long. 75° and 79° e. Its length is stated at about 300 m., and its greatest breadth 75 miles. Its principal feeder is the river Ili. It has no outlet.

BALKH, a district of Afghan Turkestan, the most northerly province of Afghanistan. It was for some time subject to the Khan of Bokhara. It corresponds to ancient Bactria, and lies between lat. 35° and 37° n., and long. 64° and 69° e. It is bounded on the n. by the river Oxus, on the e. by Budukshan, on the s. by the Hindu-Kush, and on the w. by the desert. Offsets of the Hindu-Kush traverse it in a n.w. direction, and slope down to the low steppes of Bokhara. Its length is 250 m.; its breadth, 120. Its situation was once important during the overland commerce between India and eastern Europe before the sea-route by the cape of Good Hope was followed. The soil has the general characteristics of a desert land; only a few parts are made fertile by artificial irrigation; and such are the vicissitudes of climate, that where grapes and apricots ripen in summer, and the mulberry-tree permits the cultivation of silk, in winter the frost is intense, and the snow lies deep on the ground. The natives are Usbek Tartars; and their character seems to depend very much on that of the country. In the barren regions, they are simply plunderers of caravans; in the more favorable ones, they are peaceful nomads; and in the most prosperous districts they are tillers of the soil, and artisans in towns and villages. Pop. estimated at about 1,000,000.

BALKH, the chief t., 23 m. from the Amu, is situated where the Rudi Haaj is distributed in numerous canals. It is surrounded by a mud wall; but though bearing the imposing title of Amu al Bulud (Mother of Cities), it has little of the grandeur of ancient Bactra, on the site of which it is built. It was twice destroyed by Genghis Khan and Timur; and as late as 1825, it was plundered by the powerful ruler of Kunduz, Mir-Murad-Bei. The neighborhood is famous for its corn and fruits. As a boundary town between Afghanistan and Bokhara, B. assumed a prominent position in the British-Afghan war. Pop., 2000.

BALL. Games with balls were among the most favorite gymnastic exercises of the ancients. They were played almost daily by all, young and old; by the highest statesman equally with the lowest of the people. The Greeks prized the game as a means of giving grace and elasticity to the figure, and erected a statue to one Aristonicus for his skill in it. The effeminate Mæcenas amused himself during a journey by playing B., as we learn from Horace. In the gymnasia of the Greek, and in the Roman baths there was a special compartment for Ball-playing (*sphæristerium*), where certain rules and gradations of the exercise were to be observed according to the state of health of the player. The balls were of very various kinds; they were generally of leather, and filled with air; others were stuffed with feathers. Ornamented balls, composed of 12 differently colored segments (such probably as are to be seen in modern toy shops), are mentioned in Plato's *Phædon*. There was also great variety in the kinds of game, each having a name. In one, the B. was thrown up, and the players strove who would catch it as it fell; another was the same as our foot-ball; in a third, a number of persons threw it at one another, either with a view to hit, or for the B. to be caught and returned; in a fourth, the B. was kept rebounding between the earth and the palm of the player's hand as often as possible.

Ball-playing seems to have been of equal antiquity in the west of Europe, and to have come down uninterruptedly to modern times. In the 16th c., it was in great favor in the courts of princes, especially in Italy and France. The French *jeu de paume* and the English *tennis* (q.v.), are often mentioned. Houses were built for playing in all weathers; and in gardens and elsewhere long alleys were laid out for the purpose, the names of which still adhere to many localities. The B. was struck with a mallet—It. *maglia*, Fr. *mail* or *maille*, Eng. *mall*. The mallet was also called by the compound name *pall-mall*, *pell-mell*, or *pall-mall*, from It. *palla* (Lat. *pila*), a ball. The same names signified also the game or the alley where it was played; hence the English malls and pall-malls. The game is thus described in *Blount's Glossographia*, quoted in Cunningham's *Hand Book of London:*

"Pale maille (Fr.), a game wherein a round bowl is with a mallet struck through a high arch of iron (standing at either end of an alley), which he that can do at the fewest blows, or at the number agreed on, wins. This game was heretofore used in the long alley, near St. James', and vulgarly called pell-mell."

Towards the end of the 18th c., the game of B. ceased to be played at courts, and at the same time went out of fashion in the higher circles of continental society, though it is still practised by the people in Spain and Italy. The forms of it called *cricket* (q.v.), *golf* (q.v.), *foot-ball* (q.v.), *fives* (q.v.), *lawn tennis*, *polo*, etc., are more or less practised throughout Great Britain.

For cultivating graceful motion, agility, and strength, as well as promoting general health of body and cheerfulness of mind, Ball-playing is one of the best gymnastic exercises. Ancient physicians were in the habit of prescribing a course of balls to their patients where most modern doctors would likely prescribe *pills;* and in this point at least the ancient practice might be copied with advantage.

BALL. In the somewhat indefinite language of the military and naval arts, all kinds of shot and bullets are occasionally called by the collective name of *ball*. This was especially the case when nearly all such projectiles were solid and spherical, before the era of hollow and spheroidal shells. At present, when the varieties are so numerous, it is more usual to employ the terms BULLET and SHOT (q.v.). These, together with

SHELL, are subdivided into numerous kinds, the most important of which will be found noticed under their proper designations. A particular class of spherical combustibles is described under BALLS. For BALL-CARTRIDGE, see CARTRIDGE.

BALL (Fr. *bal*), a dancing entertainment. In England there are co. balls, attended by the gentry of the shire or co. military balls, court balls, subscription balls, besides balls on various festive occasions. Whether designated balls or assemblies, these entertainments are conducted with great decorum, according to certain established usages. If of a general kind, it is expected that those who avail themselves of tickets shall be of undoubted respectability; and, as a further voucher of propriety, a number of lady-patronesses (married ladies of distinction) take a lead in the management, and grace the assembly by their presence. Ordinarily, the charge for gentlemen's tickets at subscription balls is at least two-thirds higher than those for ladies. According to etiquette, no unmarried lady can attend a ball unless she accompany a gentleman, or a married lady. All, of both sexes, are expected to be in full dress—anything else would be held disrespectful. Fancy balls are entertainments at which every person attending is expected to be in a fancy or peculiar national costume; in other respects, they are conducted like ordinary balls. Masked balls, once so common, have now, for obvious reasons, lost their repute. At all high-class balls, there is an appointed master of the ceremonies, or "director," who superintends the proceedings, and, in the event of there being no programme, prescribes the dances.

BALL, GAME OF. See BASE BALL.

BALL, THOMAS, b. Mass., 1819. A sculptor. Among his works are statues and busts of Washington, Webster, Everett, Choate, etc.

BALLACHU'LISH, a *quoad sacra* parish, partly in Argyle, and partly in Inverness shires. In the Argyleshire part of the parish, 11½ m. s.s.w. of Fort William, on the s. side of Loch Leven, an e. branch of Loch Linnhe, are the celebrated quarries of blue roofing clay-slate. These quarries, which have been wrought for some time previous to 1760, employ from 200 to 300 men. White and gray marble quarries exists also in the neighborhood.

The slate is exposed on the mountain-side, and the quarries, commencing on the shore, extend southwards along the side of the mountain. The face of the rock is laid open by three workings fronting the w., and rising one above another in successive step-like terraces, all of them being entered from the n. end of the bed. The height from the lowest terrace to the top of the workings is about 216 ft., and the face of rock wrought about 536 feet. The situation of the quarries permits the water and débris of broken and waste slate, which amounts to about six times the quantity of salable materials raised, to be at once got rid of into the sea. A few years ago, the annual produce amounted to from 5,000,000 to 7,000,000 of roofing-slates, weighing about 10,000 tons. The village of B. contained in 1871, 944 inhabitants.

BALLAD. The name is of Italian origin (*ballate*), and meant originally a dance-song, being derived from the mid. Lat. *ballare* or *balare*, corresponding to the Gr. *ballizein*, to dance. The B. is a kind of poem which it is very difficult to characterize. In the course of centuries it has undergone various transformations, and the name has been transferred to pieces which in extent, subject, and character have no longer anything in common with the primitive ballad. The confusion of ideas was rendered still worse from the circumstance that poems of exactly the same nature were styled sometimes romances, sometimes ballads, sometimes epic or lyrico-epic, or poetic narratives; so that it was left to the caprice of the poet which of these generic names he would give to his production. As early as the 12th c. the Italians gave the title of B. to short, purely lyrical pieces, allied to the sonnet or still more to the madrigal, and which generally had love-sorrows for their subject. Dante has such *ballate*. Akin to these are those French ballads which Molière set himself against, and which fell into disuse. The earliest ballads, as the word is now understood, are those of England and of Scotland, beginning about the 14th century. They in so far resemble the Spanish romances, that the subject in both is narrative, and handled lyrically. See LYRIC. The Spanish romance, however, has more of the lyrical element, and is of a gayer cast, reflecting the southern character of the people; while the northern B. took a more earnest, somber shape, especially among the Danes; though in the n. also there are ballads of a cheerful and sportive tone.

As far as subject is concerned, the B. is a species of minor epic (q.v.). The name is generally applied to a versified narrative, in a simple, popular, and often rude style, of some valorous exploit, or some tragic or touching story. Ballads are adapted to be sung or accompanied by an instrument. They are comparatively short, the story being circumscribed, and not embracing a combination of events, as the plan of the grand epic does. There can be little doubt that the B. has been the first form of poetry among all nations; and that the earlier epics or heroic poems of the higher kind, such as the Spanish Cid or the German Nibelungen, grew out of such simple beginnings. Of the popular B., Scotland, or more correctly the border-land of Scotland and England, is allowed to have produced the best examples—as *Chevy Chase*, *Fair Helen of Kirkconnel*

Lee, and many others. As a B. of modern composition may be instanced Goldsmith's *Edwin and Angelina*.

Many of the old popular songs of the Germanic nations are just narratives of epic events and incidents in which the feelings of the composer manifest themselves. But the name of B. was not then in use, and such poetical narratives were called simply songs, or more specifically perhaps *lays* (Ger. *leich*). It was not till the last half of the 18th c. that the foreign name was transferred to them.

The B. has, in recent times, been cultivated chiefly by the Germans, and in their hands it has assumed a more artificial development. Bürger may be said to be the creator of the modern ballad. He was intimately acquainted with the more simple Scotch and English B. poetry; but while adhering to its spirit, he gave to his own compositions a far wider extent, surrounded his narration with descriptions of scenery and other decorations, and by means of dialogue imparted to them the vivacity of the drama. His *Leonore* has become at once classical and popular. Bürger, Schiller, Göthe, and Uhland are the greatest German names in this department of composition. Following the practice of these writers, it has become common to confine the name B. to an epic narrative with something fabulous and supernatural in the background. In this sense, Göthe's *Erlkönig* is a ballad; and Coleridge's *Ancient Mariner* is perhaps the best exemplification in English.

BALLANCHE, Pierre Simon, 1776–1847; a French theocratic philosopher, author of *Du sentiment considére dans la litérature et dans les Arts*, *Antigone* (a prose poem), *Essai sur les Institutions Sociales dans leur Rapport avec les Idées nouvelles*, *Le Vieillard et le Jeune Homme*, *L'Homme sans Nom* (a novel), *Palingénésie Sociale*, *Vision d'Hébal*, etc. The *Palingénésie*, which he did not finish, was to be an exposition of the workings of God in history, and is considered his greatest work. B. became a member of the academy, and is represented as a warm-hearted, amiable man, whose intellect was overshadowed by his imagination.

BALLARAT, the oldest of the *considerable* gold-fields of Victoria, and in fact the oldest but one of all the gold-fields of the colony. It is about 65 m. w. by n. of Melbourne. It was first worked in Sept., 1851, the comparatively unimportant ground at Anderson's creek, which dated from Aug. of the same year, having been the earliest result of the "prospecting" which, a few months previously, had been stimulated by the newly discovered "diggings" of New South Wales. Though B. was speedily rivaled by Mount Alexander and Bendigo, yet it has by no means lost its original pre-eminence. As its surface-digging became exhausted, mines were formed—some of them now as deep as average English coal-pits. In 1876 there were in B. (also spelt *Ballaarat*) 142 steam-engines, of 4662 horse-power, working the alluvial mines, and 159, of 3866 horse-power, used in quartz mining. *B. West* was raised to the dignity of a city in 1870, and has a pop. of nearly 50,000. It is connected by railway with Melbourne.

BALLARD, a co. in w. Kentucky, on the Mississippi and Ohio rivers; 500 sq.m.; pop.'80, 14,378—1,725 colored. Productions—tobacco, wheat, corn, and oats. Co. seat, Blandville.

BALLAST is a heavy substance employed to give a ship sufficient hold of the water, to insure her safe sailing with spread canvas, when her cargo and equipment are too light. The amount of B. required by a ship depends not only on her size and cargo, but also on her build; some forms of construction requiring more B. than others. It is not merely the *quantity* of B. which a skillful mariner has to consider; he is required also to take into account its *distribution*. If a heavy mass of B. be deposited within a small compass near the keel, it places the center of gravity very low down; the ship will sail sluggishly, and is said to be "stiff." If, on the other hand, the B. be massed too high up, the ship becomes "crank," and cannot carry much sail without danger of being upset. Under average circumstances it is considered that a ship is well ballasted when the water comes up to about the extreme breadth amid-ships.

In ballasting a ship, the cargo and B. are considered together, the quantity and distribution of the latter being made dependent on the former. In a ship of war, the B. is made subservient to the requirements of the necessary stores and war *materiel;* in a merchant or passenger vessel, to the convenience of the passengers and the careful stowage of the cargo. During the last great European war, the ships of the British navy were supplied with a certain conventional weight of B., according to size and armament. Thus, a 100-gun ship had 550 tons of B.; an 80-gun, 440 tons; a 50-gun, 235 tons; a 36-gun, 225 tons; a 20-gun, 110 tons, etc. The recent revolution in the sizes and shape of war-ships, however, and the introduction of steam-propulsion, have rendered all such fixity of ratio inapplicable.

The substances used as B. are various—chiefly iron, stone, gravel, sand, mud, and water. Iron is now superseding the next three varieties in ships of any importance; and water-ballast is gradually being introduced in the collier-ships of the Tyne, Wear, and Tees. Water-ballast is employed in four different ways. *Bag-water* B. is contained in water-proof bags laid on the floor of the vessel, and filled or emptied by means of a pump and a hose. *Bottom-water* B. is confined beneath a false bottom in the vessel. *Hold-water* B., first employed in screw-steamer colliers constructed by Mr. Scott Russell, is contained in a large receptacle, which may be filled with the cargo when the ship is not in B.

Tank-water B. is contained in two fore-and-aft tanks, which can easily be filled and emptied. The customs' laws relieve merchant-ships from certain formalities and payments when leaving a port in ballast.

The term B. is employed by civil engineers to signify the sand or gravelly material which is laid as a packing between railway-sleepers, in order to give them solidity. No English railway is considered to be complete or safe for transit until it is dressed and finished by ballasting. The possibility of procuring B. at a cheap rate, considerably affects the cost of railway undertakings.

BALLAST HEAVING has reference to the use of sand or mud ballast. In order to prevent captains from filling up, or otherwise injuring the entrance to rivers, ports, havens, roadsteads, etc., by the discharge of ballast, certain regulations have been made at most maritime places as to its disposal. The Trinity House corporation has a peculiar jurisdiction over the bed of the Thames, and regulates all the proceedings touching the reception and discharge of ballast. Before the use of water-ballast, the collier captains ballasted their empty ships with gravel or sand, mostly dredged up from the bed of the Thames in and near Woolwich Reach. Generally about 10,000 tons per annum were thus used. The ballast-heavers were men employed by the Trinity House ballast-office in transferring sand from the bed of the Thames to the empty ships. When the collier vessels returned to the Tyne or its neighborhood, they were not permitted to empty the sand in the river, but were under penalties to discharge it on shore. This is the origin of the vast mounds or sand-hills on the banks of the Tyne, which have been made very useful in the construction of railways. Ships coming into, as well as those leaving the Thames in ballast are equally subject to Trinity House control. The ballast-office corporation of Dublin has similar powers in reference to the river Liffey.

BALLATER, a village of Aberdeenshire, Scotland, on the banks of the Dee, 36 m. w.s.w. of Aberdeen. It is remarkable as the resort of numerous visitors, on account of its chalybeate springs. Pop. '71, 691.

BAL'LENY ISLANDS, a group of 5 small volcanic islands discovered in the Antarctic ocean, 1839. Lat 66° 44′ s., long. 163° 11′ east.

BALLET (of similar derivation with the word *ball*—see BALLAD), a species of dance usually forming an interlude in theatrical performances, but confined principally to operas. Properly, a B. is a theatrical exhibition of the art of dancing in its highest perfection, and must therefore, in general, comply with the rules of the drama as to its composition and form. The pantomimic sacrificial dances of antiquity, although they may be regarded as the source of Attic tragedy, are not to be considered as directly the origin of the ballet. The B., as known to us, undoubtedly originated in the service of the courts. We find it existing in Italy in the beginning of the 16th c., especially at the court of Turin, where it was enriched by the inventive genius of count Aglio; and where the princes and princesses of the court themselves took part in it, in song and declamation as well as in dance; for the B. at first appeared in combination with the other theatrical arts, and completed the chaotic medley exhibited in these spectacles, which were at once mythological, allegorical, fantastic, warlike, and pastoral. From these mingled elements the individual species of dramatic entertainments were gradually evolved in their distinct forms. Baltagerini, director of music to Catharine de' Medici, was the first to introduce the B. into France, where it soon became such a favorite, that Louis XIII. danced in one of these ballets, and his example was followed by Louis XIV. in his youth. The latter made his last appearance on the stage in 1699, in the B. of *Flora*. Hitherto. the B. had always appeared in combination with the characteristic features of the opera, and even of comedy, as is evident from the works of Quinault and Molière, arranged by Lully. The art of dancing possessed then little dramatic expression, and still required to be introduced and explained by singing and recitation. In 1697, Antoine Houbart de la Motte undertook to reform the B., to which he imparted both dramatic action and the expression of passionate feeling. About this time, women first made their appearance in the B., as well as in plays and operas, which had till then been performed exclusively by men. There is no mention of any female B.-dancer of note before 1790. About the middle of the 18th c., Noverre separated the B. from the opera, gave it an independent dramatic form, and laid the foundation in his writings of an ingenious theory on the subject. The mythological B., a relic of the magnificence of Versailles, came to an end during the consulate, when it gave place to the newly invented comic ballets *Dansomanie*, *La Fille mal Gardée*, and the *Arlequinades*. Vincenzo Galeotti, in Copenhagen, carried out the ideas of Noverre so far as to subordinate the dance to purely dramatic principles, instead of giving it the first place as formerly; and thus he gave to his ballets the character of great rhythmical pantomimes. These splendid and talented performances were longest kept up in the theater of Milan, where the most lifelike and magnificent tableaux were exhibited in pantomime; and subjects were attempted far beyond the limits of the ballet. The story of *Hamlet* was turned into a B., and the subjects of several other tragedies were similarly treated. In general, the B. has now become unfaithful to its original design and its true artistic signification; and exhausts itself in the exhibition of mere feats of bodily agility, tasteless displays of artificial dexterity, distortions of the person almost to dislocation, and balancings of the figure in attitudes often indelicate. Consisting as it does more of external show than internal meaning, it contributes gradu-

ally to blunt the public taste for the enjoyment of the legitimate drama, which speaks more to the mind than to the eye.

BALL-FLOWER, so named from its resembling a ball placed in a circular flower; an ornament peculiar to the decorated style of Gothic architecture which prevailed in the 14th century. The B.-F. is supposed by some to be an imitation of a pomegranate, by others of a hawk's bell.

BALLINA', a seaport t. on the confines of Mayo and Sligo counties, Ireland, but chiefly in Sligo, on the Moy, 7 m. s. of its entrance into Killala bay. The Moy runs through the town, is crossed by two bridges, and separates the two counties. B. proper is on the Mayo side, the Sligo portion being a suburb called Ardnaree. The tide runs up to the town, but the river is only navigable from the sea up to a mile and a half below B. B. has a brisk trade in agricultural produce, salmon, and cured provisions. Coarse linens and snuff are manufactured here. Many anglers resort to the river Moy and lough Conn. Killala bay was the rendezvous of the French invaders in 1798. They landed and took B., but were, three weeks afterwards, defeated at Killala. Pop. '71, 5843.

BALLINASLOE', a small inland t. on the borders of Galway and Roscommon counties, near the center of Ireland, on both sides of the river Suck—which divides the two counties—8 m. from its confluence with the Shannon, and 81 m. w. of Dublin. The Suck at B. is divided into several channels, over which the road from Athlone to Galway is carried by a succession of bridges and causeways 500 yards long. B. is noted for its great annual fair in Oct., one of the largest in the kingdom. It is the seat of a poor-law union, and the station of the Galway militia staff. Pop. '71, 5053.

BALLINROBE', a small t. of Ireland, co. Mayo, picturesquely seated on the Robe, about 3 m. from its mouth in lough Mask, and about 16 m. s.s.e. of Castle Bar. B. is a seat of petty and general sessions, and has a union workhouse and a barrack. It has a weekly market and two annual fairs. Pop. '71, 2408.

BALLI'OL COLLEGE, Oxford, was founded between 1263 and 1268 by John de Balliol, father of John Balliol, king of Scotland. The original foundation consisted of 16 poor scholars, and the revenue for their maintenance amounted for many years to only 8*d.* per week for each. In 1340, the establishment was enriched by benefactions from Sir William Fenton and sir Philip Somervyle, the latter of whom gave the college a new body of statutes. Its most important subsequent benefactors were Bell, bishop of Worcester, in 1566; William Hammond, Esq., in 1575; Peter Blundell's executors in 1615 and 1676; Lady Periam, 1620; Warner, bishop of Rochester, 1667; John Snell, esq., 1677; and Mrs. Williams, 1830. The society consists of a master, 13 fellows, and 24 scholars. The number of members on the books in 1877 was 600. The master and fellows enjoy the privilege of electing their own visitor. John Wycliffe was master of this college in 1361; among its scholars have been John Evelyn, and Bradley the astronomer. The Snell exhibitions for students of Glasgow university attract annually to this college a few distinguished Scottish students. Among these have been sir William Hamilton, J. G. Lockhart, and Dr. Tait, archbishop of Canterbury.

BALLIS'TA. See BALISTA.

BALLIS'TIC PEN'DULUM. An instrument so named was invented by Robins, in the latter part of last century, to ascertain the velocity of projectiles, and to prove the quality of gunpowder. It consists of a large block of wood suspended from a strong horizontal axis; and it is so solidly constructed as to bear the heaviest blow of the heaviest shot without injury. An excavated center on one side of the block is filled with sand, packed in leather upon an iron frame; four bags form a filling or core. The core, forming the place of impact, is easily replaced after each firing. Straps of wrought iron suspend the block from the wrought-iron axis or shaft. The shaft-ends have knife-edges, which rest on V. supports. The construction is such, that a violent percussion makes only a very slight oscillatory movement in the block. A brass graduated limb measures the arc of vibration; and a brass slide is pushed forward by an index attached to a bar connected with the suspension straps. Another form of instrument for similar purposes is described under EPROUVETTE; and some of the results of these experiments are noticed under GUNNERY. See WAR-SERVICES.

BAL'LIUM. See BAILEY.

BALLOON (Fr. *ballon*, a large ball). According to the principle of Archimedes (q.v.), bodies immersed in a fluid are buoyed upwards with a force equivalent to the weight of the fluid displaced by them. If their own weight is not sufficient to counterbalance this force—that is, if they are lighter than the fluid—they rise upwards with a force equal to the difference of the weight of the displaced fluid and of their own weight. A B., therefore, which consists of an integument inclosing a gas within it, will rise in air in the same way that a cork rises in water, provided that the weight of the whole be less than that of an equal volume of air. If one, for instance, occupy as much space as 1000 lbs. of air, but weigh itself—covering, gas, and appendages—600 lbs., it will be impelled upwards with a force of 400 lbs. The gases employed for filling balloons are either hydrogen or ordinary coal-gas. The former, when pure, is between 14 and 15 times lighter than atmospheric air, and the latter generally about two and a half.

The B., as it is at present employed, is a large pear-shaped bag, made of any pliable silk cloth, covered with a varnish, made by dissolving caoutchouc in oil of turpentine, to render it air-tight. The common size of this bag varies from 20 to 30 ft. in equatorial diameter with a proportionate height. The mouth or neck of this bag is just large enough to enable a man to get inside to make any necessary repairs, and is, of course, turned downwards when the B. is inflated. A net-work of hempen or cotton twine is accurately fitted to the B., and the separate cords, on which it ends, are tied to a circular hoop placed a few feet below the neck. The car, generally a large wicker-basket, is suspended by ropes from this hoop, and hangs at a considerable distance below, so that the aëronaut may be removed from the vicinity of the gas. The net-work serves to distribute the weight of the car and its charge equally over the whole upper surface of the balloon. One of the most important requisites in the construction is the valve, which is introduced into the top of the balloon. It consists of a wooden clapper, 4 or 5 in. square, opening inwards, and kept closed by a sufficient spring. A rope attached to this valve descends through the neck into the car, where, to prevent accidental opening, it is allowed to dangle freely. The furniture of the car are the ballast or sand-bags, by emptying which the B. may be lightened; the barometer, or corresponding apparatus for telling the height ascended, or the upward or downward course of the B.; the map and compass, for showing the direction of the voyage; and the grappling-iron, tied to the end of a long rope, for anchoring the B. at the descent. During his flight, the aëronaut has at his disposal the means of guiding his air-ship only in an upward or downward direction, the motion of translation being wholly dependent on the wind by which it is borne. If he wishes to ascend, he throws some of the ballast over the side of the car; and if to descend, he pulls the valve-rope, so that, the gas rushing by virtue of its specific lightness through the passage made for it by the open valve, the buoyant material may be lessened. It is evident that the power of thus directing his machine becomes more limited with each exercise of it, for in each case there is an unrepaired loss of the means necessary to it. All attempts at guiding balloons in a horizontal direction have hitherto proved failures. In ordinary flights, the mouth of the B. is left open, so that there is no danger of explosion arising from the expansion of the gas in the rarer regions of the atmosphere. The diffusion that takes place through the open neck is inconsiderable during the few hours that an aërial voyage lasts. Early aëronauts, who kept their balloons closed, frequently ran considerable risk by inattention to the valve when the imprisoned gas demanded vent for its expansion.

The art of traversing the air by means of balloons, generally called aëronautics, and sometimes aërostation, is of comparatively recent date. The germ of the invention of balloons is to be found in the discovery by Cavendish, in 1766, of the remarkable lightness of hydrogen gas, then called inflammable air. Prof. Black, of Edinburgh, seems to have been the first who conceived the idea that a light envelope, containing this gas, would rise of itself. He requested Dr. Monro, the professor of anatomy, to give him some thin animal membrane for the experiment, but for some reason or other, it was never made. The first practical attempts were made by Cavallo, who, in 1772, filled swine's bladders and paper-bags with the gas, but found the former too heavy, and the latter too porous; and he only succeeded in raising soap-bubbles inflated with the gas. The invention of the B. is due to the two brothers Stephen and Joseph Montgolfier, paper-makers at Annonay, in France, whose names are as distinguished in the development of their own branch of manufacture as in the history of aëronautics. It immediately struck these brothers, on reading Cavendish's *Different Kinds of Air*, that the air could be rendered navigable by inclosing a light gas within a covering of inconsiderable weight. Led by their avocation, they fixed upon paper as the most fitting material for the purpose, and first attempted to make balloons of paper filled with inflammable air. Finding that these emptied themselves almost as soon as they were filled, instead of abandoning the paper as an unsuitable covering for the gas, they sought after another gas more suited to the paper. By a chain of false reasoning which need not here be detailed, they thought they found such in the gas which resulted from the combustion of slightly moistened straw and wool, which had, as they imagined, an upward tendency, not only from its being heated, but from its electrical properties, which caused it to be repelled from the ground. It is hardly necessary to say that this so-called Montgolfier gas possessed no advantages for raising balloons other than that possessed by heated air of any kind; in fact, the abundant smoke with which it was mixed, by adding to its weight, rather detracted from its merits. At Avignon, in Nov., 1782, Stephen Montgolfier first succeeded in causing a silk parallelopiped, of about 50 cubic ft., to rise to the roof of a room. Encouraged by this success, the brothers made experiments on a larger scale at Annonay with an equally happy result; and finally, in June, 1783, in the presence of the states of Vivarais, and of an immense multitude, they raised a B., 35 ft. in diameter, to a height of 1500 feet. This last, nearly spherical in shape, was made of packcloth, covered with paper, and was heated by an iron choffer placed beneath it, in which 10 lbs. of moist straw and wool were burned.

The news of this extraordinary experiment soon reached Paris, where it produced a most lively impression. A commission was appointed by the academy of sciences to report upon it. Public curiosity, however, could not await the tardy decision of this body, and accordingly a subscription was entered into to defray the expense of repeating

the Annonay experiment. Such was the excitement that the subscription was filled in a few days, and the construction of the B. was intrusted to the brothers Robert, famous philosophical instrument-makers of the day, and to prof. Charles, a young but experienced physicist. As the detailed account of the Annonay ascent had not reached Paris, and as nothing was therefore known of the Montgolfier gas, Charles fixed upon hydrogen as the gas most likely to insure success. It was, however, a formidable undertaking to produce it in sufficient abundance for a B., as it was at that time only dealt with in small quantities in the lecture-room. By ingenuity and perseverance combined, he triumphed over this difficulty, and succeeded in filling, in the course of four days, a silk globe of 12 ft. in diameter. This B. was transferred to the Champs de Mars, the largest open space in Paris, where, on the 27th of Aug., 1783, it ascended in the presence of 300,000 spectators, half the population of the city. At the instance of the commission already referred to, Stephen Montgolfier constructed a fire-B., 72 ft. high, and 41 ft. in diameter. It ascended before the commission on the 12th of Sept., 1783, but being held captive, it was much injured by a violent wind which blew at the time, and after it descended it was finally broken up by heavy rains. Another was made of nearly the same dimensions, which ascended on the 19th of the same month at Versailles, the king and royal family "assisting" at the spectacle. This ascent is worthy of note, from the fact that a sheep, a cock, and a duck were placed in an ozier-basket attached to the lower part of the B., and that these first aërial voyagers reached the ground again in safety.

The B. was now a *fait accompli*, and it began to be seriously discussed whether it might not be serviceable as an air-ship for bearing men aloft as passengers. The solution of this question was first given by Pilâtre des Rosiers. In a Montgolfière, as the heated air-B. was called, 74 ft. high, and 48 ft. in diameter, supporting at its base a gallery of wicker-work, he, in company with the marquis d'Arlandes, made the first aërial voyage, 21st Nov., 1783. They remained in the air 25 minutes, and sailed across the Seine and over a considerable part of Paris. The year 1783, so fertile in the annals of aërostation, was destined not to pass away without witnessing an additional, and even more satisfactory, triumph. On the 1st of Dec., prof. Charles, along with Robert, rose from the Tuileries gardens with a hydrogen B.—then called a *Charlière*—made from the proceeds of a public subscription. This B. was made of alternately red and yellow gores of silk sewed together, and coated with caoutchouc varnish. It was covered with a net which supported the car, and was furnished with a valve, a barometer, and sand-ballast, and was, in fact, a complete aërial machine. It may be said that the art of aërostation at once attained perfection in Charles's B., and no essential change or improvement has taken place since. In consequence of the danger attending the use of fire-balloons, and the engrossing attention which they demand of the aëronaut, they have now entirely given way to the hydrogen or coal-gas balloons. Before they became obsolete, several remarkable voyages were made in them. The same Pilâtre des Rosiers made 30 leagues in one of them, the longest voyage ever executed in a Montgolfière. Among the names of the first professional aëronauts, those of Lunardi, Blanchard, and Garnerin deserve special note. Lunardi was the first who made the ascent in Great Britain; and Blanchard, along with the American Dr. Jeffries, crossed the English channel from Dover to Calais in circumstances of almost unparalleled danger, Jan. 7, 1785. Garnerin first descended from a B. by a parachute (q.v.), Oct. 22, 1797. It is much to be regretted that the first aëronaut, Pilâtre des Rosiers, fell a victim to a blind devotion to his art. In order to outvie Blanchard, he constructed a compound machine, consisting of a hydrogen B. above and a Montgolfière below, and started from Boulogne, accompanied by a young natural philosopher named Romain, on the morning of the 5th of June, 1785. He had not ascended many minutes, when, as it afterwards appeared, on attempting to open the valve of the hydrogen B. by the rope attached to it, he caused a rent of several yards in it, so that it emptied itself almost immediately, and fell on the Montgolfière beneath. The fire in the latter not being kindled, the whole machine fell with a frightful rapidity to the earth, and the ill-fated aëronauts perished on the spot whence they had risen. It is worthy of remark, that though several melancholy incidents of this kind are on record, the number of casualties in the navigation of the air has been less in proportion than in the navigation of the sea. For 1500 aëronauts and 10,000 ascents, calculating approximately, only 15 lives have been lost, certainly a small proportion considering dangers and inexperience.

In 1794, during the wars of the revolution, an aërostatic institution was formed at Meudon, near Paris, for training a corps of "aërostiers," in order to observe the enemy by means of balloons. A balloon under the management of this corps was present at the battle of Fleurus, near Charleroi, fought against the Austrians. During the siege of Paris, 1870–71, the B. was extensively employed. Countless letters and several persons left the beleaguered city in balloons. There was, of course, no attempt made to come back in such a conveyance: carrier-pigeons were the return messengers.

Balloons have been enlisted in behalf of science. The first ascent for scientific objects was made at Hamburg, July 18, 1803, by Robertson and Lhoest. The results obtained, more particularly regarding the diminution of terrestrial magnetism, and the general feebleness of electrical and galvanic phenomena in the rarer portions of the atmosphere, were considered of such importance by the French institute, that

another ascent was determined on; MM. Biot and Gay-Lussac were appointed to take the management of the B. and of the physical experiments; and they started, accordingly, on the 20th Aug., 1804. As this aërial expedition was not altogether successful, a second was undertaken by Gay-Lussac alone, in the same year, in which he rose to a height of 23,000 feet. The observations of the French savants did not confirm those made by Robertson, for after a series of experiments, as careful as their novel situation would admit, they found that no diminution was perceptible in the intensity of electrical phenomena in the upper air. Since then, many scientific aërial voyages have been undertaken, among which may be mentioned that by Humboldt in America; those made by Mr. Rush, in company with Mr. Green as steersman, on behalf of the British association, during 1847–49; and that by MM. Barral and Bixio (1850) at Paris. Recently, the most remarkable ascents have been made by Mr. Glaisher for meteorological observation. On one occasion he ascended to a height of 7½ m., the barometer standing at 7 inches. The B. contained 90,000 cubic ft. of gas, and carried 600 lbs. The hygrometric and thermometric laws of the air may yet be ascertained by B. ascents, as well as the nature of aërial currents, at present so imperfectly understood. The introduction of coal-gas, instead of hydrogen, by Mr. Green, is the most important advance in aërostation since the earliest days of the art. His large coal-gas B., in 1836, bore Messrs. Green, Holland, and Mason from London to Weilburg, in Nassau, distant 500 m., in 18 hours. Mention should also be made of the spindle-shaped navigable balloons of MM. Girard and De Lôme.

In the United States, aërostation has been prosecuted with great zeal. Mr. J. Wise has more than once exploded his B., when high up in the air, to show what he considers to be always the case, that the fragments with the net-work form in such circumstances a parachute, which moderates the rapidity of descent, and shields the aëronaut from danger. During 1859, the longest flight on record was made by Mr. J. Wise, Mr. La Mountain, and others, who, starting from St. Louis with the intention of reaching New York, succeeded in following the course they had mapped out for themselves until they had crossed lake Erie; when they were caught in an adverse current of air, and forced to abandon their original design, after having traveled 1150 m. in less than 20 hours. In Sept., 1859, Mr. La Mountain made a trip of 300 m. in 4 hours. Mr. Lowe, another American aëronaut, constructed an immense B., which he called an aërial ship, the greatest circumference of which was 387 ft., with a capacity to hold 700,000 cubic ft. of gas, and a lifting-power of 23½ tons, and furnished with many new appliances for elevating, depressing, and directing the machine.—See *Voyages Aériens* (Eng. edit. by T. Glaisher, 1871); *Les Ballons dirigeables*, Tissandier (1872); "Aëronautics" in *Ency. Brit.*; and *Quart. Rev.*, July, 1875.

BALLOT (in French, *ballotte*) is a little ball used in the practice of secret voting, which is thence generally called "voting by B.," whether it be a ball or a ticket that is used. Votes may be taken by B. in various ways—e.g., the voter may deposit a ball in either of two boxes, so conjoined that no one shall be able to say into which he drops it; or he may be presented with two balls—a white and a black—and so drop one of them into a box that it shall be unknown which he used. Tickets marked "Yes," "No," or with the names of candidates, will clearly serve the purpose of balls in private voting. The dicasts in Greece voted secretly by means of balls, stones, or shells, with marks. From this use of marked shells (Gr. *ostrakon*) in popular voting came the Greek *ostracism*, or secret vote of the people, by which they drove into exile those who became obnoxious to them. Tabulæ or tickets were chiefly used by the Romans. If the vote concerned a change in the law, the tickets were marked V. R., the initial letters of the words "Uti Rogas," expressing consent to the proposer's proposition; and A. for "Antiquo," expressing adherence to the old law. If the vote concerned the election of candidates to a public office, then the tickets bore the names of the candidates. The system of secret voting in Rome was fixed by various laws, of which the Gabiniana Lex most closely resembles the modern project of vote by ballot.

The system of vote by B. is much in use among moderns in private or social clubs, and in the election of officers and other acts of public or joint-stock companies. The propriety of employing it in private clubs has never been questioned, for to the harmony of these it is essential that the votes of a few should suffice to exclude an obnoxious person; and looking to the personal and invidious nature of the vote, it is equally essential to their harmony that the voting should be secret. A candidate for admission, who succeeds in the face of a few, though not a sufficient number of voters, could not but regard those who voted against him as enemies. But if the voting be by B., all he can know, if the voters keep their own counsel, is that some persons are unfriendly. It is thus left open for him to associate on friendly terms with all the members—a condition of the success and continuance of such associations. But whether the system was suited to political and municipal voting, used to be in this country the subject of keen debate, at a time when it was in use in France, in several of the United States, and in the Australian colonies.

We have said that the system prevailed in Greece, and on its fruit there—especially in the exercise of the ostracism—there have been various opinions. While some have considered that the Athenians, for instance, acted under cover of secrecy, frequently without a just sense of responsibility, there is the authority of Mr. Grote, in his *History*

of Greece, on the other side, to the effect that they exercised the right most beneficially. But if we have in Mr. Grote an advocate of the B., in Gibbon we have an opponent of it. In his *Decline and Fall of the Roman Empire*, that philosopher dates the decline of the republic from the introduction of secret voting, which, he says, destroyed public confidence—in effect, broke up the ancient relations of patron and client, and caused a general demoralization of the people. To come to modern times, we find the B. in use in the Venetian senate; and that in Britain it was first demanded, not for the purpose of elections, but of votes in parliament. In Scotland, during the revulsions against the court in the reign of Charles II., the system was actually adopted in the legislature; but it does not appear to have afforded voters in all cases the desired protection. No one would now dream of demanding its introduction in parliament, whose proceedings, according to popular opinion, cannot be too open and above-board. On this point it may be mentioned that secret voting was the rule, for over five years (from 1840 to 1845), in the chamber of deputies in France, when it was abolished, as being productive of abuse. This, however, as we have said, bears on a use of the system that has now no advocates. Two illustrations remain of its use in elections. In the colonies of Melbourne and Sydney, the B. is said to have worked well, though it has been doubted whether its efficacy has been properly tested in these countries, in which there is so much individual independence, peculiar to new countries, that those who vote care little for concealment. In the United States, on the other hand, it is said to be the general opinion that the system has proved inefficacious. In the state of New York, where the B. was adopted several years ago, there is now a party demanding open voting, as a cure for the evils introduced by the secret system. They say it has among the Americans opposed no effectual obstacle to coercion and intimidation from the majority, while those to whom the arrangements for secrecy are intrusted, flagrantly betray their trust, and the voters on either side are, as a rule, well known to the public.

The advocates of the B. used to maintain that it would prevent bribery, intimidation, and undue influence. They regarded its reputed failure in America as being beside the question as to its suitability for this country, because in America what the voter has to contend against is the pressure of the many, while with us he seeks to resist coercion by individuals. The tenants, for instance, they said, want security, through concealment, against the loss of their farms, should they vote against the wishes of their landlord. They believed it would prevent bribery, through the uncertainty that the bribed party would vote as he promised. And as a candidate would not give bribes, because he could not trust that he would get value for his money, so intimidation would not be attempted in the absence of any security that it would be of effect. To this it was answered, on the other side, that the case of America was in point, inasmuch as intimidation might arise here, as there, from a majority, and that the case of a shopkeeper and his patrons was that of many against one all over the world. If the B. failed to protect the unit against the crowd in one country, how could it succeed in another? As to the undue influence of individuals over many—as of a landlord over his tenants—it could only be prevented providing the many, in all their public acts, contradict their secret votes. If the many acted publicly as if they agreed with the few, and privately voted against them, we should have had a state of things in which the professed public opinion would have been in antagonism with the public policy, supported by private votes—a state of things justly regarded as being impossible to be produced. The influence of individuals, then, must remain—i.e., the secret voting would be of no use, since, short of lifelong hypocrisy, it must fail to be a protection. As to bribery, the opponents of the B. thought better of human nature than those who would purify it by machinery. "Honor among thieves," they said: "he who takes a bribe, either has no principle left in him for which to vote contrary to his promise, or will be guided by his deceased sense of honor." On the other view, they put it, you secure the vote of a rogue, through his playing the knave doubly, by the public in taking the bribe, and by the briber in not fulfilling his pledge. That men will be inclined to give and take bribes as formerly, despite the somewhat diminished security, they appeared not to doubt.

An element in the controversy was the question whether the franchise was to be regarded as a public trust, or a private power to be used at the individual's discretion. The opponents of the B. maintained the franchise to be a trust, on which view, certainly, it should be openly exercised. Its advocates, on the other view, held the object of the franchise to be the ascertainment of the conscientious opinions of the people. The fact is, the right partakes of both characters: it is a power of expressing opinion by the agent under a sense of responsibility. The B. gives greater security for independence of thought; but the public vote is attended by the greater security for sense of responsibility. It used to be common to sprinkle pleas against the B. with high praise of the whole scheme of British politics, as open, manly, and candid, and with expressions of contempt for the B., as sneaking, and dissonant with that scheme. But the advocates of the B. were not unprepared with a ready and obvious retort to such arguments. Public feeling was kept alive on this question by annual motions in parliament. From 1835, its introduction was an open question with the whigs. The radicals, in 1859, were greatly pleased to find lord John Russell expressing himself as being almost a convert to their views. The controversy was put an end to in July, 1872, when voting at parliamentary and municipal elections in Great Britain and Ireland was decreed to be by ballot.

BAL'LOT FOR MILITIA. See MILITIA.

BALLOU, HOSEA, 1771–1852; b. N. H.; minister of the Universalist denomination; son of a Baptist minister. He was self-educated; was expelled from his father's church on declaring his belief in the final salvation of all men; began to preach at 21 years of age, and became minister of the Second Universalist church in Boston, in which he preached 35 years. He started the *Universalist Magazine* in 1819, and in 1831, with his grand-nephew, began the *Universalist Expositor*, a quarterly publication. It is said that he preached over 10,000 sermons, none of which were written before delivery. His brothers, David and Benjamin, were also preachers of the same faith.

BALLOU, HOSEA, 2d, D.D.; 1796–1861; b. Vt.; the grand-nephew of Hosea of Boston; was pastor in Connecticut and Massachusetts, and in 1853 president of Tuft's college. He was one of the editors of the *Universalist Magazine*, now published under the name of *The Trumpet*. He was the author of *Ancient History of Universalism*, etc.

BALLOU, MATURIN MURRAY, son of Hosea of Boston; b. Boston, 1823; editor of several literary journals, author of a biography of his father, *History of Cuba*, and compiler of the *Treasury of Thought*. He is one of the editors of the Boston *Globe*.

BALLS, HOLLOW. In military pyrotechny, many varieties of B. are made, differing in purpose from bomb-shells, but, like them, filled with ignitible composition. They are used to give light, to produce a dense smoke, or to diffuse a suffocating odor. Some of them, though called B., are not globular in shape. *Light-B.* consist of canvas stretched over a skeleton frame, and painted; the frame is filled with a composition of saltpeter, sulphur, resin, and linseed-oil, rammed down hard; and is provided with a fuse, the length of which determines the time that will elapse before the composition ignites. These light B. weigh from 5 lbs. to 70 lbs. each, according to their size. They are intended to give out a brilliant light, which may reveal the operations of the enemy during night at a siege or in the field. *Smoke-B.* are made of several thicknesses of paper, shaped by means of a globular core or mold. They are filled with gunpowder, saltpeter, powdered sea-coal, Swedish pitch, and tallow; and are calculated, after being fired off, to send out a dense smoke for nearly half an hour, in order to blind or incommode the enemy. *Stink-B.* are filled with a composition which, when ignited, diffuses an odor almost intolerable. Some of the contrivances of capt. Norton and other inventors at the present day, noticed under ASPHYXIANTS, are extensions of the same principle as these inflammable balls. It may here be added, that most of these projectiles, especially light-B. and smoke-B., are fired from mortars rather than from guns.

BALL'S BLUFF, on the Potomac, 33 m. above Washington, the scene of a defeat of the union forces under col. E. D. Baker, in the first year of the rebellion, Oct. 21, 1861. The conflict was severe, and the union troops, from 1500 to 1700 in number, were utterly defeated, their loss exceeding 1000 men; the confederate loss was reported to be 155. Baker was blamed for rashness, and gen. Stone was imprisoned, but afterwards released and given a command.

BALLSTON SPA, seat of justice of Saratoga co., N. Y.; 7 m. w. of Saratoga springs; once much frequented as a watering place, but long since over-shadowed by its neighbor. Pop. '70, 2970.

BA'LLY, or BAL, a Celtic word or prefix, signifying "town" or "dwelling," enters into the composition of hundreds of names of places in Ireland and Scotland. It is allied (see letter B) to Gr. *polis*, city, and to the Lat., Ital., and Span. *villa*.

BALLYCASTLE, a small seaport t. in the n. of Antrim co., Ireland, in an open bay opposite Rathlin isle, 88 m. n. of Belfast, and 5 m. s.w. of Fairhead. It lies at the base of Knocklayd mountain, 1635 ft. high; and the marine and mountain scenery around is very romantic. B. consists of an upper and lower town, a quarter of a mile apart. Its harbor and pier cost £150,000, but the former is now filled with sand. Coal was dug here at least 500 years ago. Linen manufacture and salmon-fishery are carried on here. Near B. are the Bonnamargy Abbey ruins. There is a singular fissure, called the "gray man's path," in the face of a greenstone precipice near B. on the way to Fairhead. Pop. '71, 1739.

BALLYME'NA, a small inland t. in the center of Antrim co., Ireland, in a plain, on the right bank of the Braid, 2 m. above its junction with the Maine, and 33 m. n.n.w. of Belfast. It lies in a densely peopled and well-cultivated district, the inhabitants uniting the pursuit of agriculture with the manufacture of linen. B. is one of the greatest linen and flax markets in Ireland, and its vicinity is covered with extensive bleach-fields. Pop. '71, 7931.

BALLYSHANNON, a small seaport t. in the s. of Donegal co., Ireland, the chief t. of the co., though not the capital. It is situated at the mouth of the river Erne, on a small inlet running off from Donegal bay, and 120 m. n.w. of Dublin. A bridge of 14 arches crosses the Erne here. The Erne discharges more water than any other Irish river except the Shannon, and falls 140 ft. over a rugged bed in the last 9 m. of its course; 400 yds. below the bridge at B. the river falls in a cataract 16 ft. high at low water, and 450 ft. wide, over a limestone ledge of rock. The chief streets of B. are very steep.

There is a valuable salmon-fishery on the river. The export trade is small, in consequence of the existence of a bar at the mouth of the harbor and the prevalence of w. winds. Pop. '71, 2958.

BALM, *Melissa officinalis*, an erect, branching, perennial, herbaceous plant of the natural order *labiatæ*, a native of the s. of Europe, naturalized in a few places in England. It has ovate crenate leaves, and axillary half-whorls of white flowers on one side of the stem. The whole plant has an agreeable lemon-like smell, on account of which it is frequently cultivated in gardens. The stems and leaves are used in medicine as a gentle aromatic, stimulant, and tonic. B. is also employed for making an agreeable and somewhat exhilarating beverage called B. wine. B. was formerly in much higher repute than now for its medicinal virtues. Its qualities depend on an essential oil of a pale yellow color called oil of balm.

For medicinal use, the herb should be cut before the appearance of the flowers, which begin to expand in July. It is nearly inodorous when dried. The taste is somewhat austere and slightly aromatic. B. scarcely produces any remedial operation upon the system. The quantity of oil which it contains is not more than sufficient to communicate a pleasant flavor to the infusion, which forms an excellent drink in febrile complaints, and when taken warm tends to promote the operation of diaphoretic medicines. —A variety of the common cat-mint (*nepeta cataria*) with a smell like that of B. is often mistaken for it.—MOLDAVIAN B. (*dracocephalum Moldavicum*) is a native of the country from which it derives its name and of Siberia, etc.; an annual plant having, when fresh, a smell like that of B., but less pleasant. It is much used in Germany for flavoring dishes.—BASTARD B. (*melittis melissophyllum*), a native of the s. of England and of many parts of Europe, is a very beautiful plant which when dried has a delightful fragrance and retains it long. All these are of the natural order *labiatæ*.

BALMEZ, JAIME LUCIEN, 1810–48; a Spanish ecclesiastic, philosopher, and author. His most important work is *Protestantism Compared with Catholicism in their Relation to European Civilization*, a very able defense of the Roman church. He wrote also *Fundamental Philosophy*, and a *Course of Elemental Philosophy*.

BALM OF GIL'EAD. See BALSAM OF GILEAD.

BALMO'RAL CASTLE, the autumnal residence of her majesty queen Victoria, is situated in a beautiful dell in Braemar (the s.w. district of Aberdeenshire) on a natural platform that slopes gently down from the base of Craigan-gowan to the margin of the river Dee in front and about 48 m. w. of the city of Aberdeen. The castle commands a magnificent prospect on all sides. In 1848 prince Albert purchased the reversion of a 38 years' lease from the representatives of Sir Robert Gordon, who had held it under the earl of Fife, and in 1852 he acquired the fee-simple of the estate from the Fife trustees for the sum of £32,000. The old castle not being sufficiently commodious for the royal family, prince Albert erected a new one at his own expense, in what is called the Scottish baronial style of architecture. The castle consists of two separate blocks of building united by wings and a massive tower 35 ft. sq., rising to the height of 80 ft., surmounted by a turret 20 ft. high. At a distance the castle, which is built of granite, has a strong and imposing appearance, looking almost as if it had been hewn out of one huge rock of that material. Great improvements have been made, chiefly those projected by the late prince Albert, in the approaches to the royal residence. The estate now includes Birkhall, Knock Castle ruins, Loch Muick, and "dark Lochnagar," celebrated by Byron (which is about 7 m. s.w. of B. C.), and contains about 10,000 acres, in addition to 30,000 acres of hill-ground which have been converted into a deer-forest.

BAL'NAVES. HENRY, of Halhill, an eminent lay-reformer of the 16th century. Born at Kirkcaldy in Fifeshire of poor parents, who, however, contrived to give him a university education at St. Andrews, he went to the continent, and entered a free school at Cologne, where he greatly improved his scholarship, and received instruction in the principles of the new faith which Luther had just promulgated. On his return to Scotland, he studied law, and acted for some time as a procurator at St. Andrews. In 1538, James V. made him a senator of the college of justice; and on Arran being appointed to the regency, B. was made secretary of state. In 1543, he was imprisoned on account of his Protestantism, but appears to have been liberated in the following year. He now appears to have made himself active on the Protestant side; and it is asserted that he was privy to the conspiracy formed for the murder of cardinal Beaton, and that he acted for the conspirators at the English court. In 1547, he took refuge in the castle of St. Andrews, and was declared a traitor and excommunicated. When the castle was captured by the French, B., with Knox and others, were sent to Rouen as prisoners of war. While in prison here, B. wrote a treatise on justification, to which Knox added marginal notes, and prefixed a dedication, and which was afterwards published with the title of *The Confession of Faith*. When Mary of Guise was raised to the regency in 1554, B.'s forfeiture was rescinded, and he returned to Scotland, and took an active part on the side of the lords of the congregation, by whom he was appointed one of the commissioners who settled the treaty of Berwick in 1559–60, which established by law the reformed religion in Scotland. In 1563, B. was nominated a commissioner to revise

The Book of Discipline. He afterwards acted for the regent Murray in the inquiry into the charges against Mary for the murder of Darnley. He d. in 1579; one account says 1570. Both Knox and Melville had a high opinion of him alike for his piety, wisdom, and learning.

BALOTRA, a t. of India, in the Rajpoot state of Joudpore, 59 m. s.w. of the city of Joudpore. It is situated on the right bank of the river Loonee. Being on the high-road from Joudpore to Dwarka, a celebrated place of pilgrimage in the w. of Guzerat, it is a great resort of pilgrims, with whom its bazaar is often crowded. Many of the inhabitants of the town subsist by providing for their wants. The town is supplied with good water from 125 wells, lined with masonry. Pop. 7275.

BALSAM, a name formerly comprehensive of many resinous substances and oils, to which important medicinal virtues were ascribed, as well as of medicines compounded of resins and oils. When the term B. is now used without addition, the balsams of Peru and Tolu are generally intended.—These two balsams are very similar in all their more important properties, and are both produced by trees of the genus *myrospermum* (or *myroxylon*), of the natural order *leguminosæ*, sub-order *papilionaceæ*, natives of the tropical parts of America. *M. Peruiferum*, which is called the quinquino, a beautiful tree, common from Peru to Mexico, is generally regarded as the species which produces the B. of Peru; and *M. Toluiferum*, a very similar species, found on the mountains of Tolu, the banks of the Magdalena, etc., as that which produces the B. of Tolu; but it is doubtful if the difference is not at least as much owing to the modes of procuring and preserving the B.; and other species of the same genus (*M. punctatum* and *M. pubescens*) are supposed also to yield it. B. of Peru appears in two forms, known as *white B. of Peru* and *black B. of Peru;* the former of which has been said to be obtained from the pods, and the latter from incisions in the trunk of the tree; but it has also been stated that the white B. flows from the trunk, and that the black B. is obtained by distilling down the wood after the manner of tar-burning, or by boiling with water. The actual evidence is insufficient to determine these points with certainty, and it is not improbable that different methods may be employed. White B. of Peru is at first of the consistence of recent honey, and of a light yellow color; the black B. is of a reddish or blackish brown color, and of the consistence of treacle. B. of Tolu, until recently, appeared in commerce dry and friable, but is now generally soft and tenacious when first imported, becoming hard by age. Both balsams have a very fragrant odor. They are used in confectionery, to impart a flavor like that of vanille; also in perfumery, and for pastilles, etc. In medicine, they are administered as gentle stimulants and tonics, and particularly in chronic bronchial affections. *Tolu lozenges* are a popular and pleasant remedy for troublesome coughs. These balsams are also used for cleansing ulcers.—They contain cinnamic acid, and a peculiar oily substance which has been called *cinnameine*, and is also known as oil of B. of Peru. The name *white B. of Peru* is sometimes given to a balsamic substance which flows from the *liquidambar styraciflua*. See LIQUIDAMBAR.

BALSAM, or BALM OF GILEAD, is a liquid resinous substance, which has long enjoyed a very high reputation in the east, being prized not only for its fragrance, but also for the medicinal virtues which it is supposed to possess. It is the subject of several allusions in the Old Testament, which strongly indicate the prevalent opinion of its preciousness; and is celebrated by Strabo, Pliny, Diodorus Siculus, and other ancient writers, almost as a cure for every disease. It is still somewhat doubtful what tree furnishes it, but it is generally believed to be a species of *balsamodendron* (q.v.)—a small tree growing in Arabia and Abyssinia, and known as *B. Gileadense.* The finest balsam, called opobalsam or balm of Mecca, is obtained by incisions, is at first turpid and white, but finally becomes of a golden yellow color, and of a consistence like honey. Inferior kinds are obtained by boiling the fruit and the wood. B. of Gilead is irritating when applied to the skin, and is believed to resemble B. of copaiva in its effects upon the human system. *Balsamodendron opobalsamum*, a species very nearly allied to *B. Gileadense*, is sometimes said to furnish this balsam.

Other substances, sometimes designated balsams, and possessing a somewhat similar fragrance, are produced by different species of *amyridaceæ* (q.v.). Among them is one called American balm of Gilead, the produce of a tree called *icica carana.*—Balsamic substances are furnished also by a number of species of *clusiaceæ*—balsam of Umiri, a fragrant yellow fluid, by *humirium floribundum*, a South American tree, of the natural order *humiriaceæ.*—CANADIAN BALSAM is a kind of turpentine obtained from the Balm of Gilead fir (*abies balsamea*); HUNGARIAN BALSAM, from the mugho or mountain pine (*pinus pumilio* or *mughus*); and CARPATHIAN BALSAM, from the stone pine (*pinus pinea*). See FIR and PINE.—BALSAM OF COPAIVA is the produce of different species of *Copaifera.* See COPAIVA.

BALSAM is also the common name of a natural order of succulent herbaceous plants, *balsamineæ* or *balsaminaceæ* of botanists, of which the beautiful B. (*impatiens balsamina* or *balsamina hortensis*), so much cultivated in gardens and green-houses, is a familiar example. Upwards of 100 species are known, natives chiefly of damp bushy places in the East Indies, and many of them plants of great beauty. They are almost all annuals, and have generally white or red flowers. This natural order is very closely allied to *geraniaceæ* (see GERANIUM) and *oxalideæ* (q.v.), wood-sorrel, etc., but is distinguished

from both by the extreme irregularity of the flowers, and from the former also by the beakless fruit, which is a five-celled capsule, bursting by five elastic valves. The leaves are simple and without stipules, the flowers generally axillary.—The common B. is a native of the East Indies and Japan. Many fine varieties have resulted from careful cultivation. It has an upright succulent stem, usually about 1 to 2 ft. high, but in favorable circumstances will attain a greater size. It often appears with flowers partially double, but still capable of producing seed. In Britain, the seed is usually sown on a slight hot-bed, and the plant is often kept in the green-house; although even in Scotland it may be made an ornament of a sheltered border. It is one of the flowers frequently to be seen in cottage windows. A vulnerary was formerly prepared from it, whence it has its name. One species of B. (*impatiens noli-me-tangere*), called yellow B. or touch-me-not, is a native of Europe, and a doubtful native of Britain. It has yellow flowers, and one of the petals prolonged into a spur. Its ripe capsules burst on the slighest touch. This and two other species are natives of North America.

BALSAMODENDRON (Gr. balsam-tree), a genus of small trees or bushes of the natural order *amyridaceæ* (q.v.), having small green axillary flowers, small dry oval fruits, and small pinnated leaves with 3 or 5 leaflets. Some of them are spiny: they generally exhibit a scrubby appearance, and have little foliage. They are remarkable for the balsamic substances obtained from their wood and fruit—as balsam of Gilead (q.v.), myrrh (q.v.) bdellium (q.v.), and oriental elemi (q.v.). The red resinous wood of *B. kataf* is a common article of sale in Egypt; and a species called schnee is much cultivated in Afghanistan for its aromatic and stimulant properties. All the known species are natives of the East Indies, Arabia, and the e. of Africa, except that which yields African bdellium, which is found in Senegal.

BALSAM OF SULPHUR is a mixture employed for medicinal purposes, and considered of service when applied to foul ulcers. It is prepared by dissolving 1 part of flowers of sulphur in 8 parts of olive oil, which yield a dark, reddish brown, thickish substance, with a very unpleasant odor.

BALTA, a well-built and thriving t. on the Kodema, an affluent of the Bug, in the government of Podolia, Russian Poland. Pop. '67, 14,528.

BALTARD, Louis Pierre, 1765–1846; a French architect and engraver. He is known chiefly by his skill in engraving, specimens of which are found in *Paris and its Monuments*, Denon's *Egypt*, and illustrations of Napoleon's wars in *La Colonne de la grand Armée*. His son Victor, b. 1805, was architect for the French government and the city of Paris, and a member of the academy of fine arts. He built St. Augustine's church and other fine edifices.

BALTIC, a village in New London co., Conn., 42 m. e.s.e. of Hartford. It has one of the largest cotton manufactories yet built, running about 60,000 spindles.

BALTIC PROVINCES (in Russia). This term, in a wider sense, comprehends the five Russian governments bordering on the Baltic—viz.: Courland, Livonia, Esthonia, Petersburg, and Finland; in a restricted sense, it often designates the first three. The B. P. once belonged to Sweden, except Courland, which was a dependency of Poland. They came into the possession of Russia partly in the beginning of the 18th c., through the conquests of Peter the great, partly under Alexander in 1809. They have still very various constitutions, though the usual "government" machinery has been introduced, and every effort is made completely to Russianize them. The five governments have an area of about 200,000 sq.m., with a pop. in '70 (Finland in '75) of 5,126,497, including St. Petersburg.

BALTIC QUESTION, the controversy between the provinces of Esthonia, Livonia, and Courland, and the government of Russia. Peter the great promised to the provinces their own German administration, and freedom of conscience; and these rights were confirmed in 1856, but in spite thereof, the Greek church endeavors to proselyte the people, efforts are made to compel the substitution of the Russian for the German tongue in schools, and the press has been subjected to censorship.

BALTIC SEA, is the great gulf or shut sea bordered by Denmark, Germany, Russia, and Sweden, and communicating with the Kattegat and North sea, by the Sound and the Great and Little Belts. Its length is from 850 to 900 m.; breadth, from 100 to 200; and area, including the gulfs of Bothnia and Finland, about 160,000 sq. miles. Its depth is on an average 15 to 20 fathoms, in many places not so much, seldom more than 40 to 50, and never exceeding 167. Its shallowness and narrowness, the flat coasts of Prussia on the one side and the rocky coasts of Sweden on the other, and above all the numerous and sudden changes of wind accompanied by violent storms, make the navigation of the Baltic very dangerous. The group of the Aland islands divide the s. part of the sea from the n. part or gulf of Bothina (q.v.). The gulf of Finland (q.v.), branching off eastwards into Russia, separates Finland from Esthonia. A third gulf is that of Riga or Livonia. The Kurisch and other haffs (q.v.) are not gulfs, but fresh-water lakes at the mouths of rivers.

The water of the Baltic is colder and clearer than that of the ocean. It contains only a fifth of the salt of the Atlantic, and ice hinders its navigation from three to five months yearly. Tides, as in all inland seas, are little perceptible—at Copenhagen

about a foot; yet the water rises and falls at times, though from other causes, chiefly from the varying quantity of water in the rivers at different seasons. Upwards of 250 rivers flow into this sea. The chief from Germany are the Trave, Warnow, Oder, Rega, Persante, Vistula, Pregel, and Niemen; from Russia, the Windau, Düna, Narva, Neva, and Ulea; and from Sweden, Tornea, Lulea, Pitea, Umea, Angerman, Dal, the water of lake Maeler, and that of Wetter and other lakes through the river Motala. The basin of the Baltic occupies at least 880,000 sq. m., or about one fourth of all Europe; and only about a fourth of the boundary of the basin is mountainous. The principal islands are Zealand, Fünen, Bornholm, Samsöe, Möen, Langeland, and Laaland, belonging to Denmark; the Swedish islands Gottland, Oland, and Hveen (in the Sound); the Aland islands, Dagö, and Oesel, belonging to Russia; and Rügen, to Prussia. The number of vessels that pass the Sound to or from the Baltic annually is very large. See SOUND DUTIES. Timber, hides, tallow, and grain are the chief exports from the countries bordering on the Baltic. The Eider or Schleswig-Holstein canal, connecting the Baltic near Kiel with the North sea at Tonningen, facilitates the grain trade in mild winters. The two seas are also connected by the Gotha canal, which joins the lakes of s. Sweden. The most important harbors in the Baltic are: in Denmark, Copenhagen and Flensburg; in Germany, Schleswig, Kiel, Travemünde (Lubeck), Wismar, Rostock, Stralsund, Stettin, Swinemünde, Danzig, Elbing, Königsberg, Pillau, and Memel; in Russia, Riga, Revel, Narwa, Cronstadt, and Sveaborg; and in Sweden, Stockholm, Carlskrona, and Ystad.—The shores of the Baltic in Prussia and Courland have been long noted for the amber cast ashore by the waves in stormy weather. Another important phenonemon connected with the Baltic, is an alleged slow vertical movement of its coasts, *downwards* in the s. of Sweden, but further n. *upwards*, being there supposed to be at the rate of 3 ft in a century. See Lyell's *Principles of Geology*.—The Germanic nations call this sea *Ostsee*, or Eastern sea; the name Baltic is derived by Dr. Latham from an island Baltia, mentioned by Pliny, and which Dr. Latham considers to be Zealand.

BALTIMORE, a co. in n. Maryland, on Chesapeake bay; 700 sq.m.; pop. '80, 415,524—64,264 colored. The surface is somewhat hilly. It produces corn, tobacco, wheat, and garden vegetables. Co. seat, Towsontown.

BALTIMORE, a city, port of entry, and seat of justice of Baltimore co., Maryland, U. S., in lat. 39° 17′ n., and long. 76° 36′ w. It stands round a small bay which runs back from the left side of the Patapsco, about 12 m. from its entrance into Chesapeake bay, and about 200 m., by a ship's course, from the open Atlantic. The city was founded so late as 1729. The surest test of its prosperity is to be found in the rapid increase of its population. In 1800, there were 26,514 inhabitants; in 1810, 46,455; in 1830, 80,620; in 1840, 102,513; in 1850, 169,054; and in 1870 there were 267,354. Besides its safe and convenient communication with the sea, B. is connected by railway with Philadelphia, Washington, Winchester, Annapolis, Cumberland, York, Lancaster, Harrisburg, etc. From e. to w., the city is about 4¼ m. long; and from n. to s., about 3¼ broad, and covers about 10,000 acres. It is divided into two nearly equal parts by "Jones's Falls," a rapid stream which, though troublesome from its floods, and expensive from its bridges, supplies immense water-power, and an abundance of pure water for domestic use.

In 1874, imports were $26,578,554; and exports, $28,617,590. B. has a very extensive grain trade, and is one of the largest flour depots in the world. It is the chief market for tobacco in the country, and its manufactures are very important. In the year ended June 30, 1874, 2143 vessels, of 1,103,446 tons, entered and cleared the port in the foreign trade. There are 25 newspapers.

Among the commemorative structures which have gained for B. the name of the "Monumental City," the most interesting is an elegant obelisk, erected in 1815 to the memory of those who had fallen in defending the town against the British. The Roman Catholic cathedral takes the lead among the ecclesiastical edifices of B. It is a massive building of granite, being 190 ft. long, 177 broad, and 127 high; and besides one of the largest organs in the United States, it contains two beautiful paintings, presented by Louis XVI. and Charles X. of France. In B., however, the Roman Catholics have now only 23 churches out of 189. The new city hall is one of the finest buildings of the kind in the United States, and there are numerous handsome educational and charitable institutions.

BALTIMORE (*ante*), the chief city in Maryland. The colonial assembly in 1729 passed a bill for laying out a town in Baltimore co., on the n. side of the Patapsco. The earliest patent for land there was by Charles Gorsuch, a quaker, who received 59 acres on Whetstone Point, in 1662. Twenty years later David Jones settled on the n. side of the harbor, giving his name to the stream known as "Jones's Falls," which divides the "old" from the "new" towns. In Jan., 1730, a small town was located n. of Jones' Falls, and named B., in honor of Calveri, lord B. At the same period William Fell, a ship-builder, settled at Fell's point, and two years later another town was projected and named after David Jones. That town was joined to B. in 1745, dropping its name. By successive unions these little settlements passed into B., and in 1752 the future city had about two dozen houses and 200 inhabitants. In 1756, a number of the people

expelled from Nova Scotia came to B.; in 1767 B. was made the county seat, and the usual courts were established, a court-house being built on the site of the present battle monument, standing, with its antiquated whipping-post near by, until 1808. The first newspaper was begun in 1773, a theater was built, and a stage line to Philadelphia and New York established. When the revolution came, B. had about 570 houses, and nearly 6000 inhabitants. In 1776, the continental or provincial congress, fearing British interference at Philadelphia, met in B. in quarters thus described by John Adams: "The congress sit in the last house at the w. end of Market street, on the s. side of the street, in a long chamber, with two fire-places, two large closets, and two doors. The house belongs to a quaker, who built it for a tavern." A custom-house was opened in 1780, and a market in 1784, in which year a few oil lamps were set in the main streets, and watchmen were employed. Trade and commerce began soon after peace, and the city grew rapidly. Though originally a Roman Catholic colony, there came, after the revolution, a number of enterprising Scotch-Irish Protestants, whose energy and means were of great value to the city. Stage lines and packets were established to distant places, turnpikes projected, and in 1789 the course of Jones' Falls within the city was changed, and the original bed of the stream filled in. In 1792, there was an accession to the population of many refugees from San Domingo. By 1796, the inhabitants numbered 20,000, and B. was made a city and chose a mayor. During the last war with Great Britain, a force under col. Ross advanced against B., Sept. 12, 1814, and a sharp conflict ensued, in which the English colonel was slain; but the Americans were defeated with heavy loss. Still the projected assault on the city was abandoned. The entrance to the port of B. is defended by fort McHenry, on the point of land between the harbor and the Patapsco. It was during an unsuccessful bombardment of this fort by the British fleet, in 1814, that Francis Scott Key, an American prisoner on one of the English ships, composed the celebrated "Star-Spangled Banner." The city became conspicuous early in the civil war. April 19, 1861, a portion of the 6th Massachusetts and 7th Pennsylvania regiments was mobbed while passing through the city, and in the contest, nine citizens and two soldiers were killed, and three citizens and 23 soldiers wounded. No more troops were sent through B. until the city was put under military rule.

B. is on undulating ground, covering about 10,000 acres, 4½ m. from e. to w., and 3½ from n. to south. It is almost equally divided by Jones' Falls, which is crossed by several bridges. The region e. of the stream is nominally divided into two parts, Old Town and Fell's Point. The Point is the resort of seamen, and a place of ship-building and manufacturing. On the w. of Jones' Falls are the city proper and Spring Garden, the former being the center of trade and the home of the wealthiest citizens: the latter inhabited by the poorer classes and once noted for rowdyism; "My name is Jake Keyser; I was born in Spring Garden," is a song not yet forgotten.

B. has more than 200 churches, three universities, a number of colleges, and many charitable and beneficial institutions, among which are the Bay View asylum: the Spring Grove asylum; the Maryland institution for the blind; the Sheppard asylum for the insane, endowed with $1,000,000 by Moses Sheppard; the Peabody institution, which received over $1,000,000 from George Peabody; the Hopkins hospital, endowed with $2,000,000 by John Hopkins, free without regard to color or condition. The Johns Hopkins university (which see) is a new institution, magnificently endowed, giving opportunity for post-graduate study, and advanced scientific research, and gradually developing its various courses of study on a far-reaching plan. There are about 125 public schools, with 80,000 average attendance. The most notable building in B. is the new city hall, occupying an entire square of more than half an acre; 355 ft. long, in renaissance style; the outer facing of the walls, the portico, and all the ornamental work of white Maryland marble; the inner walls and floors of brick; four stories high, surmounted by a mansard roof of iron and slate, with a dome and tower of iron, rising 240 ft. from a marble base. The interior is very elegantly furnished, and the whole cost was $2,600,000. It is said to have been built entirely within the original estimate of expense. The Peabody institute was incorporated in 1857; one wing of the building, near the Washington monument, is completed. It is faced and ornamented with white marble, and is simple, but massive and imposing in style. It contains a library of 56,000 volumes, and halls for lectures, concerts, etc. The custom-house is a fine edifice, 225 by 141 ft.; the principal room is 53 ft. square, and is lighted by a glass dome, 115 ft. above the street. On the four sides are colonnades, each column being a single block of Italian marble.

B. is supplied with water from lake Roland (fed by Jones' Falls), an artificial pond 8 m. n. of the city, with a capacity of 500,000,000 galls. There are three other reservoirs, with an aggregate storage of as much more. There are also numerous small springs and fountains in the city. Of a number of public squares, Druid Hill park, of 700 acres, in the extreme n.w. of the city, is the chief, and possesses wonderful natural beauty, including forests, lakes, lawns, and about 25 m. of carriage drives.

As a manufacturing city, B. takes high rank in ship-building; in products of iron, wool, copper, cotton, and pottery; in sugar-refining, distilling, tanning, saddlery, the making of agricultural implements, etc. Near the city is clay for bricks, which is not excelled by any known in the world, and more than 100,000,000 B. bricks are made and sold annually. The largest iron-rolling mills in the United States are the Abbott works,

in the e. section of the city. As a flour market, B. is an important center; and it is also prominent in exporting tobacco, and other products. One of its features is the oyster trade. The oysters are taken from Chesapeake bay in immense quantities, canned, and shipped to all parts of the world.

In order of population, B. is the sixth city in the United States. Its progress as shown by the census has been rapid. 1790, 13,503; 1800, 26,514; 1810, 35,583; 1820, 62,738; 1830, 80,625; 1840, 102,313; 1850, 169,054; 1860, 212,418; 1870, 267,354; 1880, 332,190.

BALTIMORE, Lord, Sir George Calvert, of the Irish peerage created in 1624 by James I., who gave the title to his zealous Roman Catholic defender. Lord B. was of English birth, a graduate of Oxford, principal secretary of state in 1619, and member of parliament in 1620–21. He tried to establish a colony in Newfoundland, in 1625, but failed. He visited Virginia, but not being well received, returned to England, where he died. It was to his son, Cecil Calvert, that the Maryland patent issued in 1632. He never came to this country, but sent settlers under his brother Leonard. Cecil succeeded to the title, whence it passed to John and his heirs until 1771, when it died with Frederick, who had no children.

BALTIMORE-BIRD, or Baltimore Oriole, *Ic'terus Baltimorii*, a very beautiful American bird, found in all parts of the United States, and as far n. as 55° n. lat., but migrating to tropical or subtropical regions in winter. The genus to which it belongs is usually referred to the natural family of *sturnidæ* (see Starling). The B.-B. is in size somewhat less than a common starling; the bill conical, very acute, and a little curved; the plumage brilliant, particularly in the adult males, glossy black finely contrasting with bright orange and vermilion; the tail longish, rounded, and slightly forked. The bird is remarkably active and lively; its song extremely agreeable. Its nest is a curious and interesting structure—a pendulous cylindrical pouch of 6 or 7 in. long, usually suspended from two twigs at the extremity of a lofty drooping branch; the materials, which vary according to circumstances, being woven together with great nicety. It is sometimes sewed through and through with long horse-hairs. Thread, which may happen to be bleaching, is very liable to be appropriated to the purpose of nest-building.

The nests of other species of *icterus* are also pensile. Several are natives of North America, and others of South America. They are quite distinct from the true orioles (q.v.).

BALTSCHIK', or Baldjik', a t. of European Turkey, 18 m. n.e. of Varna, noteworthy in consequence of being in the vicinity of the ruins of Tomi, to which place Ovid was exiled.

BALTZER, Wilhelm Eduard, b. 1814; studied at Leipsic and Halle; was hospital chaplain at Delitzsch, and in 1847 founded, at Nordhausen, a free religious community. In 1848, he was chosen to the Frankfort parliament, and subsequently to the Prussian assembly. In 1868, he established a society and a journal to promote vegetarianism. He has written many works on religious topics, including a *Life of Jesus*.

BALUCHISTAN'. See Beloochistan, *ante*.

BALUSTER, popularly, *banister* or *ballaster* (Ital. balaustro; Fr. balustre) the name given to the small shafts or pillars set in a line at short equal distances, and supporting a cornice or coping. These miniature pillars have generally either a pear-shaped swelling at the lower end, or consist of two pear-shaped pieces, placed above each other, a ring of moldings being set between them. This makes the profile resemble an ancient bow or balista (q.v.), from which some derive the name; others derive it from Lat. *palus*, Eng. *pole* or pale.

BALUSTRADE, a range of balusters, together with the cornice or coping which they support. The B. is often used as a parapet for bridges, the roofs of large edifices, etc., or as a mere termination to the structure. It is also used to enclose stairs, altars, balconies, etc. Balustrades are made of stone, metal, or wood.

BALUZE, Étienne, 1630–1718; a French scholar; librarian for Colbert, the famous minister of state; in 1670, honored with the professorship of canon law in the royal college, the chair being founded expressly for him. On the fall of cardinal de Bouillon he lost his place, and was long kept out of Paris. His best known work is the *Capitularia Regum Francorum*.

BALZAC, Honoré de, one of the best of the modern French novelists, was b. on the 20th May, 1799, at Tours, where his father held a civil office. At the age of twelve, he entered the college of Vendôme, but finished his studies at the Pension Lepitre, in Paris. His father who had been impoverished by the loss of his situation, then placed him with a notary, to whom he acted as clerk. This occupation proving intolerably irksome, B. soon after began his literary career, and wrote about 30 volumes, under the name of St. Aubin, M. de Veillergré, St. Alme, etc. He received some trifling assistance in writing these novels, which were, however, so unsuccessful, that he lived in the greatest poverty. In the year 1826, he entered into partnership with the printer Barbier, and published various works; but the speculation turned out so ill, that he fell into debt, and returned once more to book-making. His perseverance was admirable. Although long

utterly unsuccessful, he continued to write on until at last he opened a path for himself by his novel *Les Derniers Chouans, ou la Bretagne en* 1800 (Par. 1829). In this book he abandoned for the first time the manner of Pigault and Lebrun, which he had hitherto adopted. Among his best works are the *Physiologie du Mariage* (2 vols. Par. 1831), *Scènes de la Vie Privée* (5 vols. 1831), *Scènes de la Vie de Province* (1832), *Scènes de la Vie Parisienne* (1832), *Le Médecin de Campagne*, *Le Père Goriot*, *La Peau de Chagrin*, *La Recherche de l'Absolu*, which were all received with much favor by the public. Of all his novels, two only can lay claim to anything like artistic completeness. They are the *Histoire Intellectuelle de Louis Lambert*, and *Eugène Grandet*. His other works suffer more or less from unnaturalness, diffuseness, and the want of a solid knowledge of the world, although there is a richness of description in portraying individual features of character, as drawn directly from the heart, not to be denied. B. exercises immense power over the female part of his readers. In his *Contes Drolatiques, colligez ès Abbaies de Touraine, et mis en lumière par le Sieur de Balzac pour l'esbattement de Pantagruelistes et non aultres* (2 vols. Par. 1833), he follows exactly in the footsteps of Rabelais. Success made B. conceitedly ambitious. He thought himself equal to the most distinguished authors of all time, and represented the aim of his literary activity to be, to give a complete picture of human life in all its varied phases. As a dramatic author he decidedly failed. He d. Aug., 1850. A collected edition of his works in 45 vols. was published in Paris, 1856–59. An English translation of his letters, with a memoir by his sister, was issued in 1878.

BALZAC, Jean Louis Guez de, b. at Angoulême in 1594. In his youth he was secretary to cardinal la Valette at Rome, where he cultivated his taste for elegant composition, and on his return to Paris devoted himself to the refinement of his native language. His efforts in this direction have given him a permanent place in the literature of his country; and though his writings do not possess much intrinsic worth, they heralded the splendid phalanx of genius which adorned the subsequent age of Louis XIV. He was a favorite of cardinal Richelieu, a member of the French academy, a councilor of state, and historiographer. His violent literary disputes with Father Goula caused him to leave Paris and retire to his hereditary property of Balzac, where he died on the 18th Feb., 1655. A collection of the works of B. appeared in Paris, edited by l'Abbé Cassaigne (2 vols. Par. 1665; 3 vols. Amst. 1684). Of all his works, his *Lettres* (3 vols. Par. 1806) have been most generally admired, and are still read. A selection from his writings was arranged by Malitourne (2 vols. Par. 1822). Compare Moreau de Mersan, *Pensées de B.* (Par. 1807).

BAMBA, a province in Congo on the w. coast of Africa, s. of the river Ambriz; abounding in gold, silver, copper, and salt. It is said to be fertile, and densely populated. The climate is good for that part of the continent.

BAMBARRA, one of the states of Sudan, western Africa, lying, so far as has been ascertained, between lat. 12° and 14′ n., long. 15° e., and 5° w., and occupying both sides of the Joliba or Niger, which flows through its center from s.w. to n.e. The principal towns of B. stand on the banks of this river. The mountains in which the Niger has its source divide it on the s. from Guinea; the Sahara desert bounds it on the n.; on the w., Senegambia; and on the e., some of its sister-states. In its general aspect, the country is said to bear a considerable resemblance to the agricultural districts of England; but in the w. there are low chains of granite hills, forming continuations of the highlands from which the Niger springs. The climate in some parts is intensely hot; in others, it is more temperate, but it is generally healthy. The rainy season lasts from June to November. The land is well watered and fertile. Double crops of corn, rice, maize, yams, etc., are raised annually without much labor.

The butter-tree, cotton-tree, oil-palm, baobab, and date, are among the most important indigenous growths. The manufacturing industry of B. is important; the women making a soft coarse cloth, much esteemed for its beautiful blue color, and the men articles in gold, iron, and ivory, in which a pretty extensive trade is carried on. The inhabitants, chiefly Mandingoes, are said to be superior to their neighbors in intelligence, and to be much sought after as warriors by the petty chiefs around them, who are at constant war with each other. They generally lend their assistance on condition of a certain payment. The upper classes profess Mohammedanism, but the lower are pagans. The introduction of the former religion has had at least one good effect. It has supplied the native dialect with a written speech through the use of Arabic letters. The chief domestic animals are horned cattle, goats, sheep, and fine horses. The wild animals are lions, leopards, elephants, wolves, panthers, etc.; and venomous reptiles, of which the natives are much afraid. Crocodiles are numerous in the rivers, which also abound with fish. The principal towns are Sego, Sansanding, Yamina, and Bammaku, which are all populous. The country has a nominal monarch, but it is in reality ruled by several chiefs.

BAMBERG, a city of Bavaria, in the district of upper Franconia, beautifully situated on the banks of the Regnitz, not far from its confluence with the Main, and in the midst of vineyards, orchards, and hop-gardens. B., which has considerably declined in importance since the reformation, is a city of considerable antiquity, having originated, it is said, with a colony of Saxons who settled here in 804. The most noteworthy of its public buildings is the cathedral, a magnificent edifice in the Byzantine style, founded

by the emperor Henry II. in 1004, and restored after fire in 1110. It contains, among other monuments, the elaborately carved tomb of the founder and his empress, Cunigunda. Attached to the cathedral is a library, with valuable missals and manuscripts and what is represented to be the prayer-book of Henry II. There are several other fine ecclesiastical structures of early date, and the old palace of the former prince-bishops of B. The ruins of the castle of Altenburg, originally the seat of the counts of Babenberg, and the scene of many important historical events, stand on an eminence about a mile and a half from the town. The educational institutions of B. are numerous. Pop. '75, 26,958, chiefly engaged in the manufacture of beer, which is famous throughout Germany, cotton, cloth, gloves, musical instruments, etc. A large export trade in licorice and garden-seeds is carried on.

BAMBI'NO, a term in art descriptive of the swaddled figure of the infant Saviour, which, surrounded by a halo, and watched over by angels, occasionally forms the subject of altar-pieces in Roman Catholic churches. The *Santissimo* B., in the church of Ara Cœli at Rome, is held in great veneration for its supposed miraculous power of curing the sick. It is carved in wood, painted, and richly decorated with jewels and precious stones. The carving is attributed to a Franciscan pilgrim, out of a tree that grew on mount Olivet, and the painting to St. Luke The festival of the B., which occurs at the Epiphany, is attended by great numbers of country people, and the B. is said to draw more in the shape of fees than the most successful medical practitioner in Rome.

BAMBOC'CIADES, in painting, are grotesque scenes from common or low life—such as country-fairs, penny-weddings, boors merry-making. The name is derived from Peter van Laar, a painter, who, on account of his personal deformity, was surnamed Bamboccio (cripple); but he was not the first painter of such scenes.

BAMBOO', *Bambusa*, a genus of grasses, of which most of the species attain a great size, many of them 20 or 30 ft., some 70 or 100 ft. in height. The species are numerous, and are found in tropical and subtropical regions, both of the eastern and western hemispheres. They are of great importance to the inhabitants of the countries in which they grow. All of them have a jointed subterranean root-stock (rhizome) which throws up 10 to 100 stems. These are generally straight and erect; although one large species (*B. agrestis*), common in dry mountainous situations in the s.e. of Asia, has crooked and sometimes creeping stems. The stems grow to their full height unbranched, but afterwards throw out straight horizontal branches, especially in their upper parts, forming a dense thicket; and many of them being strongly armed with spines, they are planted for defense, presenting a formidable barrier, even against regular troops. Some of the smaller kinds are often planted as hedges. The stems are jointed like those of other grasses, very hard, but light and elastic, hollow, containing only a light spongy pith, except at the joints or nodes, where they are divided by strong partitions. They are, therefore, readily converted into water vessels of various sorts; and when the partitions are removed, they are used as pipes for conveying water. They are also much employed for house-building, for bridges, etc. The smaller stems are converted into walking-sticks, and are imported into Europe under the name of B. cane, both for that purpose and to be employed in light wicker-work. In China, the interior portions of the stem are used for making paper. Some of the species grow to the height of only a few feet; and almost all of them are slender in proportion to their height, although *B. Guadua*, a native of New Granada and Quito, has a trunk 16 in. in diameter. The stems of different species vary also very much in the thickness of the woody part, and so in their adaptation to different purposes. The external covering of the stem is, in all the species, remarkably silicious; the stem of *B. tabacaria* is so hard that it strikes fire when the hatchet is applied. This species is a native of Amboyna and Java; its slender stems are polished, and used for the stalks of tobacco-pipes. The leaves of some kinds are used for thatch, and the Chinese plait hats of them; of the external membrane of the stems of some, they make paper. From the knots of the B. there exudes a saccharine juice, which dries upon exposure to the atmosphere, and which the Greeks called *Indian honey*. It is also sometimes named *Tabaris* or *Tabasheer;* but this name more properly belongs to a phosphorescent substance, containing silica and lime, and possessing remarkable properties, which forms in the joints of some species of B., and of other large grasses growing in dry situations. See TABASHEER.—The young shoots of some kinds of B. are eaten like asparagus, or are pickled in vinegar. Those of *B. Tulda*, a common Bengalese species, are used for these purposes when about 2 ft. long. The seeds of some species are used as rice, and for making a kind of beer. Bamboos are generally of very rapid growth, and they are often found in arid situations, which would otherwise be destitute of vegetation. It is not improbable that they may yet be employed, where they do not naturally abound, to render districts productive which are now little else than deserts, in climates like those of Arabia, the n. of Africa, and Australia; and the quality of the grain of different species seems to deserve more attention than it has ever received. The species common in the West Indies (*B. vulgaris*) is supposed to have been introduced from the East Indies. A few species are found in the Himalaya, to an altitude of 12,000 ft., and a dwarf species from that region has been successfully tried in the open air in England.

BAMBOROUGH CASTLE, on the site of which Agricola is said to have built a Roman fortress, is one of the oldest in Britain, having according to the Saxon chronicle, been erected by Ida, the first Saxon king of Northumbria, in 550. It appears to have been a royal residence for long after. In 642 it was unsuccessfully besieged by Penda, king of Mercia; and during the Danish descents on England it was twice partly demolished. Mowbray, earl of Northumberland, was besieged in B. in 1095 by William Rufus, and having fallen into the king's hands, lady Mowbray surrendered under the threat of his eyes being put out. When Northumberland was granted to Henry, son of David of Scotland, B. C. was reserved for the English crown, and here Baliol acknowledged Edward I.'s supremacy in 1296. During the wars of the Roses, it was the scene of several conflicts, and so battered and destroyed that it has not been again used as a fortress. In the time of queen Elizabeth, its governor was Sir John Foster, in whose family it continued till 1715, when it was bought, with the Forster estates, by lord Crewe, bishop of Durham, who left it with other property to trustees for benevolent purposes. The restoration of the castle, and its conversion to its present charitable uses, were chiefly carried out by one of these, the Rev. Dr. John Sharpe, who bequeathed his library to the institution. The income, which is about £9000, is expended in providing a market for the sale of provisions and groceries to the poor at prime cost; a dispensary for gratis advice and medicines to the sick; funds for maintaining, educating, and starting in life poor children of the district; lifeboats and apartments for shipwrecked sailors; a constant patrol during stormy nights for 8 m. along the coast; repairing churches, and aiding young men at the universities. B. village, near the castle, was a royal borough before the conquest, and in the time of Edward I. returned 2 members to parliament. Its pop. in 1871 was 320. Opposite B. C. are the Farne isles, where Grace Darling and her father saved the crew of the *Forfarshire* steamer in 1838.

BAMBOUK', a country of Senegambia, western Africa, lying in the angle formed by the Senegal and Faléme rivers. Its extent is roughly estimated at 140 m. in length, and from 80 to 100 in breadth. The climate is unhealthy, especially during the rainy season; but the valleys are remarkable for their fertility. Trees common to western Africa here attain enormous proportions. Vast herds of wild oxen roam the hills, and most of the wild animals of Africa abound. B. is chiefly remarkable for its gold, which the natives exchange for salt, cotton, and other manufactured goods. Its inhabitants, the Mandingoes, are professedly Mohammedans, but they cling to many pagan superstitions, and are very ferocious. B. was, four centuries ago, a short time in the possession of the Portuguese.

BAMIAN', a fruitful valley and pass of Afghanistan, about a mile in breadth, and inclosed by steep rocks, leading from Cabul to Turkestan. It is at an elevation of 8496 ft., and is the only known pass over the Hindu Kush for artillery and heavy transport. It was one of the chief centers of Buddhist worship, and with its two colossal statues was described by the Buddhist monks who visited India in the 4th and 5th centuries. The statues are found on a hill about 300 ft. high, in which are a multitude of cells excavated in the rock all round, and rising above one another in irregular tiers. The male figure is about 160 ft., the female, 120. Both are natural in attitude, and clothed in light drapery; the face of the former is the most perfectly preserved. Each figure is hewn out of a deep niche, also elaborately carved, and representing royal personages and a variety of symbols which resemble those on the coins of the Sassanidæ. Each contains a winding stair by which it is possible to ascend to the head. The whole valley is covered with the ruins of tombs, mosques, and other buildings, once belonging to the town of Ghulghuleh, which more recently occupied this site, and was destroyed by Genghis Khan in 1221. Eight m. eastward of B. lies the ancient fortress of Zohak, attributed to the fabulous Persian serpent-king of that name. The fortress is preserved for the purpose of guarding the important pass. Both there and in the valley of B., a grear number of coins, ornaments, and other antiquities have been recently found, and fully described by Masson, Wilson, Prinsep, Wood, and others.

BAMPTON, a small t. in the n.e. of Devonshire, chiefly on the left bank of the Batham, a tributary of the Exe, and 22 m. n. of Exeter. There are here extensive carboniferous limestone quarries. The manufacture of serge and pottery is carried on. St. Michael's church was built in the 14th c., and has a tower 70 ft. high. Pop. '71, 1111.

BAMPTON IN THE BUSH, a small t. in Oxfordshire, 14 m. s.w. of Oxford. It has an ancient cruciform church, with a large Norman tower, and examples of every period of the pointed Gothic style. Pop. '71, 764.

BAMPTON LECTURES. These lectures are so called after the name of their founder, the Rev. John Bampton, canon of Salisbury, who left estates originally worth £120 per annum, to the university of Oxford, for the endowment of eight divinity-lecture sermons, to be preached at Great St. Mary's every year, and to be published, at the expense of the estate, within two months of their being preached. The preacher is to lecture on one of the following subjects: "The Confirmation of the Christian Faith and the Confutation of all Heretics and Schismatics;" "The Divine Authority of the Scriptures;" "The Authority of the Primitive Fathers in Matters of Christian Faith and Practice;" "The Divinity of Christ;" "The Divinity of the Holy Ghost;" "The Apostles' and

Nicene Creeds." No person is qualified to preach these lectures who has not taken the degree of M.A., either at Oxford or Cambridge, and the same person shall never preach them twice. The first course was delivered in 1780. In 1834 and 1835, no lecturers were appointed, and no lecture was preached in 1841. With these exceptions, there has been an unbroken series of very valuable, but rather learned than popular discourses. The most remarkable are the following: Those delivered in 1784, on "Christianity and Mohammedanism," by Dr. White, who was accused of having obtained assistance in their composition from Dr. Parr and Dr. Badcock; those by Dr. Tatham in 1790, on "The Logic of Theology;" those of Dr. Nott in 1802, on "Religious Enthusiasm"—this series was directed against the pretensions of Wesley and Whitefield; those of Dr. Mant in 1812; those of Reginald Heber in 1815; Whately in 1822; Milman in 1827; Burton in 1829, on "The Heresies of the Apostolic Age;" Soames in 1830, on "The Doctrines of the Anglo-Saxon Church." But of the whole series, none have caused greater excitement and controversy than those delivered by Dr. Hampden in 1832, on "The Scholastic Philosophy considered in its Relation to Christian Theology." They were attacked on all sides, but especially by the leaders of the Oxford tract association. Hampden was accused of rationalism and Socinianism. When he was appointed regius professor of divinity in 1836, a petition against his appointment was sent up to the throne; and upon this being rejected, a censure was passed upon him in convocation by a large majority, declaring his teaching to be unsound, and releasing undergraduates from attendance at his lectures. Notwithstanding this, he was raised to the see of Hereford in 1847, under the government of lord John Russell—thirteen of the bench of bishops protesting against the appointment. The course of B. L. delivered by the late dean Mansel, in 1858, on "The Limits of Religious Thought," caused a less bitter, but scarcely less interesting controversy. Mr. Mansel possessed great power as a dialectician, and his lectures contained many very eloquent passages. The main position which he took up was, "That the human mind inevitably, and by virtue of its essential constitution, finds itself involved in self-contradictions whenever it ventures on certain courses of speculation," i.e., on speculations concerning the infinite nature of God. He maintained that all attempts to construct an objective or metaphysical theology must necessarily fail, and that the attainment of a philosophy of the Infinite is utterly impossible, under the existing laws of human thought—the practical aim of the whole course being to show the "right use of reason in religious questions." Mr. Mansel was accused by his critics of condemning *all* dogmatic theology (e.g., all creeds and articles), and of making revelation itself impossible. Mr. Maurice was one of his principal opponents. Canon Liddon's lectures in 1866, on "Our Lord's Divinity," have been the most important since dean Mansel's. The B. L. for 1874 were delivered by the Rev. Stanley Leathes, M.A., on "The Religion of the Christ; its Historic and Literary Development considered as an Evidence of its Origin."

A course of lectures similar to the Bampton was founded about the same time at Cambridge, by the Rev. John Hulse. See HULSEAN LECTURES.

BAMPU'RA, BHAMPURA, or BHANPURA, a town of Hindustan, in the territory of Indore, on the Rewa, 1344 ft. above the level of the sea, about 180 m. s.w. of Gwalior. It is situated at the base of a range of hills, is surrounded by a wall, and has an unfinished fort, built of stone, which incloses an unfinished palace. Both palace and fort were begun by Jeswunt Row Holkar, of whom there is a beautiful marble statue in the palace. B. is the principal place of a pergunnah containing 70 villages. Pop. 20,000.

BAN. This word occurs in most of the modern languages of Europe, and its primary signification appears to have been, "to make a signal" (see BANNER), "to proclaim" or "publish." This meaning it retains in the phrase, *bans* or *banns* (q.v.) of marriage. In Germany, the *acht* or *bannum* was a sentence of outlawry pronounced in the middle ages against those who escaped from justice, or refused to submit to trial. We often read of refractory princes, and even cities, being placed under the *ban of the empire*. The following are the terms of banning used in an old formula: "We declare thy wife a widow and thy children orphans; we restore all thy feudal tenures to the lord of the manor: thy private property we give to thy children; and we devote thy body and flesh to the beasts of the forest and fowls of the air. In all ways and in every place where others find peace and safety, thou shalt find none; and we banish thee into the four roads of the world—in the devil's name." Besides these sentences of outlawry, many other announcements were accompanied with denunciations and imprecations. When a grant of land was made for a religious purpose, or when a charter of liberties was granted, the transaction was proclaimed in public with certain ceremonies, and curses were denounced against any one who should violate the deed. Thus *banning*, or publishing, came to be associated with cursing; and hence the origin of the popular use of the word. It occurs in this sense in Shakespeare and Milton, and other old writers.

BAN, or BA'NUS, supposed by some to be a contraction of the Illyric word *bojan*, i.e., lord, but more probably another form of the Slavonic word *pan*, which possesses the same signification. Formerly, it was a title given to some of the military chiefs who guarded the eastern boundaries of the Hungarian kingdom, and was therefore synonymous with the German *markgraf*. The ban, who was appointed by the sovereign, but not for life, and whose appointment had to be ratified by the national diet, had originally very exten-

sive, in fact almost unlimited powers. In political, judicial, and military affairs, he was the supreme authority. Within his own territory, he exercised an influence similar to that of the palatine in Hungary, and only lower than a king. In time of war, he headed the troops of his *banat* (q.v.), and if the campaign occurred within its limits, it was his duty invariably to occupy the post of danger. He led the van to battle, or covered the rear in retreat. For these services, he was recompensed partly in ready money, and partly by a monopoly of salt. The most important banats were those of Dalmatia, Croatia, Slavonia, Bosnia, Machow, and Szorény, but their boundaries changed so frequently, that at the present day it is impossible to ascertain what they originally were. The encroachments of the Turks in the 16th c. rendered the union of the various banats necessary; and after some time, the whole were formed into the double banat of Dalmatia and Croatia. A still more complete unity was subsequently obtained by centralizing the military power. In 1723, the authority of the B. was made entirely subordinate to that of the supreme government of Hungary. After numerous vicissitudes, his powers, rights, and titles were strictly defined during the reign of Maria Theresa. He was then acknowledged to be the third dignitary of the Hungarian kingdom, appointed a member of the Hungarian council of government, and president of the council of the banat, and at the coronation of the Hungarian king went before him, bearing the golden apple, the symbol of sovereignty. Such was the position of the ban until the 4th of Mar., 1849, when Croatia, Slavonia, and Dalmatia were transformed into Austrian crownlands, and the ban made wholly independent of Hungary. In 1868, Croatia and Slavonia were reunited with Hungary. One of the Hungarian ministers superintends the affairs of the "kingdoms of Croatia and Slavonia;" while there is a special local administration for internal affairs. The head of this administration is called the ban.

BAN; ARRIÈRE BAN. Besides the civil use of the word ban, as a proclamation or prohibition, there was a military application of the term in former days in France. When the feudal barons, who held their estates and honors from the king, were summoned to attend him in the time of war, they were called the *ban*, or the levy first called out; while the tenants, subordinate to these barons, formed the *arrière ban*, or secondary levy.

BANANA, a fruit originally East Indian, but much cultivated in warm countries over the whole globe. It is now generally regarded as a mere variety of the plantain (q.v.); although they were formerly ranked by botanists as distinct species, the plantain under the name of *musa paradisaica*, and the B. of *M. sapientum*—the specific name signifying "of the wise men," and being intended to convey an allusion to a statement by Theophrastus concerning a fruit which served as food for the wise men of India, and which, from his description, is supposed to have been the plantain or banana. The names plantain and B. are somewhat vaguely used in their application to different cultivated varieties, which are very numerous; those called B. have generally dark purple stripes and spots on their stems, and the fruit is smaller, less curved, and of more delicate taste than the plantain, with a soft and luscious pulp. Each fruit is generally about four or five inches long. The B. is always used in a ripe state, and never, like the plantain, as a substitute for bread; unless when the pulp is squeezed through a fine sieve, and formed into small loaves, which, when dried, may be kept for a great length of time, but which are saccharine, and not farinaceous. It is sometimes fried in slices; it is often made into preserves; and its juice affords an excellent wine. It has been produced of good quality in hot-houses in Britain.—The fruit of *musa cavendishii* is sometimes also called banana. See PLANTAIN.

BANANA BIRD, *Xanthornus icterus*, a beautiful bird, allied to the Baltimore bird (q.v.), which it considerably exceeds in size; a native of the West Indies and warm parts of America. Its colors are tawny and black, with white bars upon the wings. It is very lively and active. It is gregarious, and a number of the nests may often be seen near each other, suspended to the extremities of slender branches of trees, so as to be out of the reach of snakes and monkeys. It is often kept in houses to destroy insects. It is very easily domesticated, and delights to be caressed.

BANANAL', also called Santa Anna, an island 200 m. long by 35 wide, in the Araguay river, Brazil; exceedingly productive of bananas, whence the name.

BA'NAS, or BUNAS, the name of three rivers of India.—1. A river of Rajpootana, rising on the western frontier of Mewar, in the Aravulli mountains, about n. lat. 24° 47', e. long. 73° 28'. Flowing through Mewar for 120 m., in a generally north-eastern direction, receiving the Beris, or Beruch, on the right, and the Botaseri on the left, it passes the town of Tonk, where it changes its course to the s.e., and falls into the Chumbul in n. lat. 25° 54', e. long. 76° 50', after a total course of 320 miles.—2. A river which also rises in the Aravulli mountains, and after a south-westward course of 180 m., is lost in the Runn of Cutch, terminating in a number of small and intricate channels.—3. A river of Rewah, in Bundelcund, having a north-westward course of about 70 m., and falling into the Sone near Rampur.

BA'NAT, any district or territory under a ban, but specially applied to a province of the Austrian empire, which has, curiously enough, *no* ban. It is bounded on the w. by the Theiss; on the s. by the Danube; on the e. by the line of mountains which sepa-

rates Hungary from Wallachia and Transylvania; and on the n. by the Maros. It consists of the three Comitate; Temesvár, Torontál, and Krassowa. Pop. '69, 1,028,263. It is partly mountainous and partly flat, but is everywhere copiously watered, and exceedingly fertile. The chief rivers are the Temes and Karasch. The climate is warm in summer, and comparatively cold in winter; but, though not unpleasant, it is far from salubrious in the w., on account of the swamps and morasses which abound. Nevertheless, it is the most productive of the Austrian provinces, yielding rich crops of wheat, spelt, and other grains; the vine is little cultivated. Wild-fowl are numerous, and the rivers swarm with fish. The mines are valuable; coal, iron, copper, gold, silver, and zinc being procured in considerable quantities. The mineral springs of Mehadia are in great repute. The principal town is Temesvár.

B. belongs to the Hungarian portion of the Austrian empire. It was formed into an Austrian crown-land in 1849, but was restored to Hungary in 1860.

BANAWARAM', a t. of India, in the territory of Mysore, in a fine open country, among the head-waters of the Hugri, 81 m. n.w. from Mysore. It is a town of some antiquity. It was taken in 1694, in a night-assault by Chika Deo, rajah of Mysore. When it had fallen under the dominion of Hyder Ali, the inhabitants were in great part removed to Nagapuri, a new town which Hyder had founded in the vicinity. Previous to this removal, the pop. was about 10,000. The new town proving extremely unhealthy, the survivors of the people of B. were permitted to return to their old habitations.

BANBRIDGE, a small t. in the w. of Down co., Ireland, on a steep slope on the left bank of the Bann, 76 m. n. of Dublin. It is a thriving seat of the linen manufacture in all its stages, from the preparation of the soil for the flaxseed to the finishing of the finest linen. Miles of bleaching-greens exist in the vicinity, and numerous factories along the Bann. Pop. '71, 5599.

BANBURY, a small t. in the n. of Oxfordshire, on the right bank of the Cherwell, 23 m. n. of Oxford. There formerly existed here a very strong castle, which was built about 1125, and sustained various sieges during the early English civil wars. At Danesmore, near B., the Yorkists were defeated in 1469. B. is the center of the famous rich red land of Oxford county. This land is among the most fertile in the kingdom. A system of canals connects the town with all parts of England. The vicinity of B. is thickly studded with villages. Numerous remains of the ancient Britons are found in the neighborhood. B. is noted for its manufacture of agricultural implements, and for its malt liquors, cheese, and cakes. There are also manufactures of plush, shag, girth, and other webbing. B. returns one member to parliament. Pop. (1871) of municipal borough, 4122; of parl. borough, 11,726.

BANC, legally, is a seat or bench of justice, and in this sense has given rise to the expression of the courts of law at Westminster "sitting in banc," or *in banco*—that is, sitting together on the bench of their respective courts, in term-time, and otherwise, as is provided by statute.

BANCA, an island n.e. of Sumatra, 1° 30′ to 3° 5′ s. lat., and 105° 10′ to 106° 53′ e. long., has an area of 6883 sq.m. Pop. '71, 153 Europeans and 41,748 natives and Chinese. Gold, iron ore, silver, lead, and amber are found, and the tin exported to Java for Holland averages 4200 tons. The sales in 1872 had a value of £533,137.

BANCO (It.), a commercial term meaning the standard money in which a bank keeps its accounts, as distinguished from the current money of the place. The distinction was more necessary when the currency consisted, as it often did, of clipped, worn, and foreign coins. These the early banks (Venice, Amsterdam, etc.) received at their intrinsic worth, and credited the depositor in their books with this bank value. The term was chiefly applied to the money in which the Hamburg bank kept its accounts, before the adoption of the new universal coinage of the German empire. It was not represented by any coinage. The Hamburg mark B. (= 1*s.* 5½*d.* sterling) was to the current mark (= 1*s.* 2½*d.*) as 20 to 16. Sweden had a peculiar bank money, 8 dollars B. being equal to 3 dollars specie. Genoa had at one time a bank standard, and the present current money being different from that, is still called "fuori banco," outside the bank.

BANCROFT, AARON, D.D., 1755–1839; b. Mass. He graduated at Harvard, and settled at Worcester, in 1785. He published, besides many sermons, an eulogy and a life of Washington, the latter reprinted in England. He was a strong opponent of Calvinism, before the Unitarians were known. Later in life he was president of the Unitarian association.

BANCROFT, EDWARD, 1744–1821; b. Mass.; practiced medicine in British Guiana, and resided several years in England. He was intimate with Franklin and Priestley. Among his works are *Essay on the Natural History of Guiana*, *Charles Wentworth*, a novel, and *Experimental Researches concerning Permanent Colors*.

BANCROFT, GEORGE, American historian, b. 3d Oct., 1800, near Worcester, in Mass., was the son of Dr. Aaron Bancroft, an eminent Unitarian minister. He entered Harvard college at the age of 13, and obtaining a valuable exhibition there, proceeded in 1818 to Göttingen, where he studied history and philology under Heeren, Plank, and

Eichhorn, and in 1820 obtained the degree of doctor. At Berlin, he attended the lectures of Hegel, and had frequent intercourse with Schleiermacher, W. von Humboldt, Savigny, Varnhagen von Ense, and other literary men of note. Subsequently, he traveled through Germany, and formed an acquaintance with Goethe and Schlosser. Having visited Paris, London, and Italy, B. returned to America, and after some time spent in tuition, devoted himself to politics. He soon became celebrated as a democratic politician, and was made collector of customs at Boston. He still continued his literary labors, especially in lectures upon German literature, philosophy, etc. When Polk was elected president, in 1845, he appointed B. secretary of the navy. While in this office, he established an observatory at Washington, and a naval school at Annapolis. In the autumn of 1846, B. was sent by Polk as ambassador extraordinary and plenipotentiary to England, where he remained till 1849, carefully collecting materials for a *History of America*. He published the result of his labors in his *History of the Revolution in North America* (Boston, 1852). He had already published his *History of the Colonization of the United States of North America* (3 vols., Boston, 1834–40). The whole of these writings are included in the author's *History of America*, a work of solid excellence, the 10th and last vol. of which appeared in 1874. In 1866, B. delivered an oration in honor of Abraham Lincoln. From 1867 to 1874, he was minister plenipotentiary at the court of Berlin. For some years he was a principal contributor to the *North American Review*.

BANCROFT, RICHARD, Archbishop of Canterbury, and a bitter opponent of the Puritans, son of John B. and Mary, niece of Hugh Curwyn, archbishop of Dublin, was b. at Farnworth, Lancashire, in Sept., 1544. Educated at Cambridge, he took the degree of B.A. at Christ's college, in 1567, and that of M.A. at Jesus' college, in 1570. He became rector of Teversham, Cambridgeshire, in 1575, of St. Andrews, Holborn, in 1584, and treasurer of St. Paul's cathedral in 1585. In the latter year he was admitted D.D. By the lord chancellor, Hatton, to whom he was chaplain, he was presented to the rectory of Cottingham, Northamptonshire. In 1589, he became a prebendary of St. Paul's, in 1592, of Westminster, and in 1594, of Canterbury. Consecrated bishop of London, May 8, 1597, he attended queen Elizabeth during her last illness. At the famous Hampton court conference under James I., he was one of the chief commissioners on behalf of the church of England, and took the lead in the disputations. In the convocation of 1603–4, he sat as president. In Oct., 1604, he succeeded Whitgift as archbishop of Canterbury; and was sworn in one of his majesty's privy council in Sept., 1605, and chancellor of the university of Oxford, 1608. He d. Nov. 2, 1610. B. had a high character as a preacher and statesman; and was a vigilant ruler of the church. He is author of two sermons, one of which, preached at St. Paul's, in 1588, contains a furious invective against the Puritans, and of two treatises respecting church order and discipline. B. left his library to his successors in the see of Canterbury forever.—His nephew, JOHN B., bishop of Oxford, 1632, d. 1640, built the palace of Cuddesden for the bishops of that see. Burned by the parliament troops, 1644, it was rebuilt, 1679.

BAND, in architecture, is the name given to any kind of ornament which is continued horizontally along a wall, or by which a building is encircled. Bands often consist of foliage, quatrefoils, or of simple bricks. *B. of a shaft* is the molding or suits of moldings by which the pillars and shafts are encircled in Gothic architecture. Several bands are often placed at equal distances on the body of the shaft when it is long, in which case they are known as shaft-rings.

BAND, or BANDS, a portion of clerical dress, and the only relic of the ancient *amice*, a linen vestment which was used in the ancient church to cover the shoulders and neck of the priest. It also forms a part of the full dress of the bar, the universities, and the leading functionaries in schools of old foundation. At Winchester and some other schools, it is even worn by the scholars themselves. The bands worn by lawyers and other civilians may be a relic of the wide stiff collar which was a part of the ordinary civilian dress in the reign of James I.

BAN'DA, chief t. of a district in Bundelcund, in lat. 25° 28′ n., and long. 80° 23′ e. In 1872, its pop. was 27,573. It is a great mart for cotton. It is situated on the right bank of the Cane or Keyn, an affluent of the Jumna, being 95 m. to the s.w. of Allahabad, 560 to the n.w. of Calcutta, and 190 to the s.e. of Agra. The district of B. contains 3030 sq.m., and (1872) 692,909 inhabitants.

BANDAGES are used by surgeons to apply pressure on a part, or to retain dressings upon wounds. The most common bandage is a strip of linen, calico, or elastic web, from 3 to 5 or more inches in breadth, rolled longitudinally; hence the name *roller*. There are also B. to suit special purposes, as the four-tailed for the head or knee, which consists of a piece of cloth split up on each side towards and nearly to the center. When applied, the tails are crossed and tied so as to make an extemporaneous night-cap. In applying the roller bandage to a leg, the surgeon first turns it round the foot, then round the ankle; and so by repeated turns, each one of which should overlap about a third of the previous one, till he reaches the calf of the leg, when he must fold at each turn the bandage sharply back on itself, by which maneuver the bandage will lie flat and smooth on the limb. The operator must remember that the bandage must be applied more tightly at the foot than in the leg, so that it may not impede the course of

the blood through the veins. This requires to be practiced, as the effect of a bandage is always for good or evil as it is well or ill applied.

BANDA ISLES, a portion of the Moluccas, consisting of 12 islands, 6 of which are uninhabited, about 50 m. to the s. of Ceram. Pop. (1870) of Banda and Amboyna, 236,737; of the former alone, probably about 110,000. Their mean lat. and long. respectively are 4° 30′ s., and 129° 50′ e. Their chief production is the nutmeg, the annual export of that spice being about 1,000,000 lbs., with a corresponding quantity—about one third—of mace. Like most of the islands in this neighborhood, they belong to the Dutch. They are lofty and volcanic.

BANDAJAN′, a pass over the Himalaya, forming the southern boundary of Kunawar. It is amidst mountains of gneiss, and is covered with perpetual snow. The summit of the pass is 14,854 ft. above the sea, and is in n. lat. 31° 22′, e. long. 78° 4′.

BANDAN′A, a kind of printed handkerchief of Indian origin, now extensively made in Britain, usually of cotton. The cloth is first dyed Turkey red, and then the pattern is made by discharging the color with bleaching liquor in a powerful Bramah press. The pattern to be discharged is cut out on two plates of such metal (lead) as may not be acted on by the liquor, and of the full size of the handkerchief. A dozen or more are put in at once between the plates, and so many of these courses are entered together as fill the press, when the pressure is applied, and the liquor is run in on the uppermost plate, which is grooved on the upper side to receive it, and holed to pass it from plate to plate through all the cloth-folds in the press. The pressure on the cloth to make clean work by preventing the spreading of the liquor, is enormous. The patterns in the real B. style of printing are spots and diamond prints, the best suited for discharging, and even for these a pressure of 500 tons is required to work them clean. See CALICO PRINTING.

BANDA ORIENTAL, a state of South America. See URUGUAY.

BANDAR′RA, GONZALO ANNES, d. 1556; called the "Portuguese Nostradamus." He was a shoemaker, composed religious verses, and pretended to give prophecies. Several works purporting to be his were issued, but probably all were written by others. Their burden was the resurrection and restoration of John IV., or of Sebastian, kings of Portugal.

BAN′DEL, ERNST VON, an eminent modern sculptor, was b. in 1800, in Anspach. While attending the academy at Munich, he prosecuted his studies so diligently that in 1820 he sent to the exhibition a plaster figure of Mars reposing, as large as life, which procured for him considerable reputation. Of various models of this kind done by him, one, a figure of Charity, was executed in marble. This work occupied the artist about ten years. It exhibits great chasteness of design, and a minute carefulness of execution. Among his best portrait busts, in which he excels, are those of Maximilian, king of Bavaria (1832), and of the artists D. Quaglio and Peter Hess. In 1834, he removed to Berlin, where his chief works were a colossal statue of Hermann (q.v.), the foundations of which were laid in 1841, but which was not inaugurated till 1875; a life-size statue of Christ; a life-size statue of Hermann's wife; and a bust of the poet Grabbe. For Hanover, where he has chiefly resided of late years, he has executed the statues of Shakespeare and Goldoni for the theater, and other works. For Göttingen, he executed a statue of William IV.

BANDEL′LO, MATTEO, an Italian writer of *novelle* or tales, was born at Castelnuovo in Piedmont about the year 1480. In early life, he became a Dominican monk, in the convent delle Grazie at Milan, but soon abandoned this vocation for a more free and independent life. His uncle, who had been elected general of the order in 1501, took him to travel with him; and in Rome and Naples, B. devoted himself to the study of belles-lettres. He then returned to Milan, whence he was driven by the Spaniards, as a partisan of France, after the battle of Pavia in 1525. He accompanied Francis I. to France, and was, in 1550, made bishop of Agen by Henry II. He left the care of his diocese to the bishop of Grasse, in order to be able to devote himself without disturbance to the completion of his tales, which he published in the Italian language in three volumes (Lucca, 1554), to which a fourth was added after his death, which took place in 1561. The tales of B. rank next to those of Boccaccio in Italy. They are distinguished by unaffected simplicity of style, fluency and vividness of narrative, and a harmonious brevity of periods. It must be confessed, however, that they are not unfrequently very impure in tone. B. wrote several other works.

BANDE NOIRE ("black band") was the name given, during the first French revolution, to the societies of capitalists who bought the confiscated buildings which had belonged to the church, emigrants, etc. The opprobrious name was fixed on them on account of their vandalism in the destruction of old relics, works of art, churches, convents, abbeys, episcopal residences, etc., many of which possessed both a scientific and historical interest. It has, however, been alleged, on the other hand, that these societies have frequently done considerable service to the community, in removing old and useless edifices, and that their minute subdivision into lots of the old territorial domains, has both favored agriculture and ameliorated the condition of the people.

BANDE'RA, a co. in s.w. Texas, on the Medina; 938 sq.m; pop. '80, 2,153—31 colored. It is a stock-raising region. Co. seat, Bandera City.

BANDEROLE, a small streamer fixed immediately under the crook, on the top of the staff of a crozier (q.v.), and folding over the staff.—Also an architectural term for the flat inscribed band used in the renaissance buildings, similar to those now used for mottoes to coats-of-arms.

BANDETTI'NI, TERESA, 1763–1837; an Italian poetess, who gained celebrity as an improvisatrice. She was much honored, not only for talent, but for virtues and accomplishments. Among her works are *Rime diverse*, *Da Morte d'Adone*, and *Il Polidoro*. She wedded Signor Pietro Landucci, a gentleman of Lucca.

BAND-FISH, or SNAKE-FISH, *Cepola*, a genus of fishes of the ribbon-fish (q.v.) family. The body is much elongated and compressed. The bones are little more solid than a mere fibrous net-work, and everything else exhibits a corresponding delicacy, so that specimens are seldom to be obtained in an uninjured state. All the species inhabit quiet depths, and are incapable of contending with waves and currents. Their singular form, and the beauty of their colors, make them objects of great interest. One species, the red B. (*C. rubescens*), not uncommon in the Mediterranean, is occasionally cast ashore by storms on the British coasts. It is about 15 in. long. Its brilliant appearance, when seen moving in the water, has suggested the names of fire-flame and red-ribbon, by which it is known at Nice.

BANDICOOT, *Perameles*, a genus of marsupial (q.v.) quadrupeds, occupying in the zoology of Australia a place somewhat analogous to that of shrews (q.v.) in Europe. Their dentition is remarkable, as they have ten cutting teeth in the upper jaw, and only six in the lower, the posterior ones of which are two-lobed: in other respects it nearly resembles that of opossums. They have an elongated head and pointed muzzle; the hind-legs are considerably longer than the fore-legs. The thumb and little toe of the fore-feet are little more than simple tubercles, so that there seem to be only three toes; and there is a fleshy tubercle in place of a thumb on the hind-feet. Their movements are similar to those of hares or rabbits. They live on bulbs, insects, etc., make ravages in potato-fields, and devour corn in granaries. There are several species. The long-nosed B. (*P. nasuta*) is about a foot and a half in length from the extremity of the nose to the origin of the tail, which is not unlike that of a large rat, but better covered with hair. It is chiefly found in the mountainous parts of New South Wales. *P. gunnii* is common in Van Dieman's Land.

BANDICOOT, BANDICOOT RAT, MALABAR RAT, or PIG-RAT, *Mus giganteus*, the largest known species of rat. The name B. is a corruption of the Telinga *pandikoku*, literally signifying pig-rat. The animal inhabits many parts of India, and is plentiful in Ceylon. It is chiefly found in dry situations, and often in hilly districts. It attains the weight of 2 or 3 lbs., and is 24 to 30 in. long, including the tail, which at the base is 2¼ in. in circumference. The body is thick, and greatly arched, black above, grayish below. Its flesh is a favorite article of food with the coolies of India, and is said to be delicate, and much to resemble young pork. It feeds chiefly on grain and roots, and is very destructive in gardens. "Its nests, when rifled, are frequently found to contain considerable quantities of rice, stored up against the dry season."—Sir J. E. Tennent's *Ceylon*.

BANDIE'RA, ATTILIO and EMILIO, two brothers well known for their tragic fate, were descended from a distinguished aristocratic family of Venice, which had once held a place in the red book of the republic. They were lieutenants in the Austrian navy, their father being rear-admiral; but, instead of sharing the pro-Austrian sentiments of their parent, they cherished enthusiastic dreams of the free and united republic of Italy. In the year 1842, they entered into correspondence with Mazzini, whom they regarded as almost a demi-god. Their glowing and enthusiastic patriotism breathes in every line of their letters. Both were noble spirits, ready for any sacrifice, but unfortunately impressed with the delusive idea that their native country could be saved by means of a conspiracy. Emilio, the younger, of a stronger bodily frame, but of a lighter disposition, was under the influence of his graver and more thoughtful brother. In the year 1843, they believed that the time was come for a revolution by force of arms; but their premature appeal finding no practical response, they fled to Corfu in Mar., 1844, where they endured many bitter disappointments and much misery. Hope alone inspired them with life; but at length, misled by false rumors of a rising in Naples, with which it is supposed the Neapolitan police had something to do, they ventured to land with twenty companions at the mouth of the small rive Nieto, in Calabria, believing that their appearance would be the signal for a general insurrection. The Neapolitan government expected them; one of their companions, a certain Boccheciampe, had betrayed them. They were attacked by an overwhelming force, and were nearly all taken prisoners at once. One only fell on the spot, and two escaped. Nothing was ever allowed to transpire respecting the trial of these unfortunate men. Attilio and Emilio were shot along with seven of their comrades in the public square of Cosenza, on the 25th July, 1844. They died joyfully, exclaiming "Viva l'Italia!" The public mind had not then become accustomed to hear of bloody deaths for political causes. A cry of indignation resounded through Europe at this "kingly revenge," as it was called in a conservative paper of the day. A

year later, their remaining companions were pardoned. The fate of the brothers B. attracted much attention in England, from the circumstance that letters of M. Mazzini, then in London, had been opened in the post-office by authority of government, which was accused of giving such information to the Italian governments as enabled them to entrap the insurgents.

BANDINEL'LI, Baccio, the son of a famous goldsmith of Florence, and one of the best sculptors of his time, was b. at Florence in 1487. His first instructions were probably received in the workshop of his father, for in those days goldsmiths wrought from their own designs. He was afterwards a pupil of Rustici, and the friend of Leonardo da Vinci. He was an angry and jealous rival of Michael Angelo, whose grandeur of conception he strove to equal, and who is said to have retaliated his enmity by contempt. It must be admitted, however, that we have only prejudiced sources from which to draw our information regarding him. Benvenuto Cellini, whose language is generally passionate and hyperbolical, is his chief accuser, although Vasari also speaks of his proud and envious disposition. Whatever may have been his moral infirmities, it is impossible to deny that as a sculptor he was in his day second only to Michael Angelo. His feuds with his brother-artists do not appear to have injured him in the opinions of persons of distinction. He was patronized by Cosmo de' Medici, Charles V., Francis I., Clement VII., and other powerful friends. Clement even bestowed on him an estate. He died at Florence, 1559–60.

His best works are bassi-rilievi, among which are those that adorn the choir of the duomo at Florence. On the high-altar in the same building is to be seen his corpse of Christ, supported by an angel, with God the Father over it. His most ambitious work is Hercules with Cacus at his feet. In the Medicean gallery are his copies of the group of the Laocoon—a masterly imitation of the antique, in which he boasted that he excelled even the ancients themselves. He also executed statues of some of his patrons; all his works exhibit power, vigor, and skillful drawing, but it is alleged, apparently with considerable truth, that "he was too fond of the terrible graces of composition."

BANDIT, a word originally signifying a "banished" or outlawed person; then one who, because outlawed, wages war against civilized society; and finally a highway robber. The banditi, or banditti, formed in Italy in earlier times, as it were, a separate community or guild, who submitted to their own stringent laws, carried on both open and secret war with civilized society, and kept up a certain romantic idea of honor. By means of the severe measures which were adopted in 1820 by the papal government against the banditti and their abettors, their haunts were broken up. Those who still occasionally disquiet the frontiers of Naples are in general people settled on the spot, who regard robbery and murder as equally a branch of their trade with agriculture. Peter the Calabrian, one of the most famous B. chiefs in 1812, assumed the titles of "emperor of the mountains, king of the woods, and lord of the highroads from Florence to Naples." The government of Ferdinand I. found themselves obliged to conclude treaties with them. The banditti must be distinguished from common robbers, who were called *malviventi*. In later times, the banditti were joined by adventurers of all kinds, to such an extent, that the Austrian troops who occupied Naples were obliged to make frequent expeditions against them. In Sicily, the banditti are most numerous in the Val Demone. They formerly acquired so much power there, that the prince of Villafranca, as a piece of policy, declared himself their patron, and treated them with much confidence. In the years 1841–43, political fugitives united with robbers and adventurers of all kinds in the Abruzzi, Calabria, and Romagna, and since then they have never been entirely extirpated. The revolution of 1848–49 added greatly to their numbers, and in several districts of Italy, especially in the states of the church, between Ferrara and Ancona, they reached an unheard of degree of boldness, notwithstanding the Austrian army of occupation. Under the command of one Bellino (known by the name of "Il Passatore"), a daring and talented man, who died in Mar. 1851, they kept the country in terror, and even burned several villages to the ground. They also carried on a real guerrilla warfare against the military forces of the country. Recent events in Italy, have, it is said, recalled numbers of these banditti to a more honorable life. See Camorra.

BANDOLEER', or Bandaleer'. Two centuries ago, soldiers' muskets were provided with *matchlocks*, a very slow and ineffective contrivance for firing. The musketeers were furnished with gunpowder in small cylindrical boxes made of wood, tin, or leather, each containing sufficient for one charge. Twelve of these little boxes were fixed to a belt called a *bandoleer*, worn over the left shoulder. In what way these were superseded by a superior arrangement, will be found noticed under Cartridge.

BANDOLINE is a mucilaginous substance used for stiffening hair, and keeping it in shape or form. It is much used by ladies in the present prevailing mode of wearing the hair, and by gentlemen, to dress their moustaches. The usual receipt for making the B. sold in the shops is to boil carrageen (q.v.) or Irish-moss with water till a thick mucilage is obtained, which is afterwards scented with *Eau de Cologne* or other perfumed spirit; a second mode of preparing B. is to soak quince-seeds in cold water for a day or two, then strain, and add perfume; and a third process is to heat gum tragacanth with water, and when a mucilage is obtained, add the scent.

BANDON, or BANDONBRIDGE, a t. of the co. of Cork, Ireland, on the Bandon, 12 m. s.w. from Cork, with which it is connected by a railway. The houses are built of stone. There are several good streets and numerous ecclesiastical and other public buildings. B. was originally peopled by a colony of English Protestants and was so strictly Protestant that, till about the beginning of the present c., no Roman Catholic would have been allowed to settle in it. More than three fourths of the population are now Roman Catholics and there is a Roman Catholic convent. B. was at one time a prosperous manufacturing t., cotton-spinning and weaving being extensively carried on; but these branches of industry have been almost entirely relinquished, and the pop., which was 9049 in 1841, had diminished to 6131 in 1871. It returns one member to the house of commons. The country around B. is very beautiful, well wooded, undulating, and pastoral. The river Bandon rises in the Carberry mountains and its mouth forms the harbor of Kinsale. Spenser describes it as "the pleasant Bandon, crowned by many a wood." It has a course of 40 m., for 15 of which it is navigable to Innishannon, 4 m. below B.

BANDONG, a commercial t. on the w. coast of Java, in the vicinity of the volcano Gunong Guntour, by an eruption of which 80 villages were destroyed in 1822.

BANDS, MILITARY, consist each of a body of skilled musicians, attached to a regiment in the British service. According to military regulations, the only indispensable instruments are drums, fifes, bugles, and trumpets, all of which are employed to give signals on the march or in active service, either for infantry or for cavalry. To supplement this meager musical establishment, however, the officers of regiments organize, chiefly at their own cost, effective military bands, who use a variety of instruments—such as flutes, clarionets, bassoons, horns, ophicleides, big drums, cymbals, triangles, etc. This arrangement has assumed almost the force of a regulation; for officers above the rank of subaltern are obliged to contribute a sum not exceeding 12 days' pay in the course of a year and an extra sum when promoted to the band-fund. The members of these bands are selected from the ranks; but the band-master, though in uniform, is often a civilian who is hired for the purpose and who generally refuses to accompany the regiment abroad, except at an increased rate of remuneration. The musicians, generally, are in an anomalous position; for, whilst serving in the band, their pay and eventually their pensions are restricted to those of the private soldier. Good musicians have at all times a tendency to quit the B.; their better prospects as teachers and players in orchestras and concerts induce them to obtain release by paying the amount of compensation prescribed by regulation. An attempt made by the duke of Cambridge in 1856 to relieve the commissoned officers of part of the expense entailed upon them by the present system failed, except as regards subalterns, and with that exception matters remained as they were. In most of the regiments of the line the band consists of a band-master and about 15 musicians; but in the choice corps the number is often much larger. The band plays on parade and at mess as a part of regular duty. When M. B. play at festivals, concerts, etc., "by permission of the commanding officer," the payment goes to the musicians; and the chance of obtaining these fees is one of the inducements to the men to remain in a service which has very few attractions in relation to the actual regular amount of pay. The bands of the 3 regiments of foot-guards—Grenadier, Coldstream, and Scots Fusilier—are very frequently engaged in this way during the London season.

BANEBERRY. See ACTÆA.

BANER, JOHAN, 1595–1641; a Swedish general under Gustavus Adolphus in the 30 years' war, commanding the right wing in the battle of Leipsic and defeating Pappenheim. After the death of Gustavus the regent Oxenstiern made B. chief of the army. He was victorious at Wittstock and at Chemnitz and overran all Germany, where he was accused of unnecessary harshness. He failed in an attempt in 1641 to capture the emperor at Ratisbon and died soon afterwards. He had few equals in reckless gallantry.

BANFF (pron. Bamf), the capital of Banffshire, a seaport in the n. of the co., on the left bank of the mouth of the Doveran, 45 m. by road, and 50 by rail, n.n.w. of Aberdeen. It forms a higher or inland town, and a lower or sea town, on the Moray Firth. On a height between the towns are some remains of a royal castle, on the site of which is now a large house—the "castle." To the e. of B. is Duff house, the seat of the earl of Fife, with a large park. The harbor is liable to be sanded up. A seven-arched bridge over the Doveran unites B. with the seaport of Macduff, half a mile to the east. The chief exports are corn, cattle, salmon, and herrings. In 1872, 429 vessels of 70,386 tons, entered the port. Pop. '71, 7439 in B., and 3407 in Macduff. In 1877–78, the valued rental of B. was £10,699. B. with Elgin, Cullen, Inverury, Kintore, and Peterhead, sends one member to parliament. Robert II., in 1372, made B. a royal burgh. Archbishop Sharp of St. Andrews was born here in 1613. Macpherson, a noted robber, was executed here in 1700. Some houses and much property in B. were destroyed by the Aug. flood in the Doveran in 1829.

BANFFSHIRE, a co. in the n.e. of Scotland, bounded n. by the Moray Firth; e., s.e., and s. by Aberdeenshire; w., by Elgin and Inverness shires. It stands 13th among the Scotch counties in size, and 14th in population. Its greatest length is about 68 m., its

greatest breadth about 32—average 12; its extent of sea-coast about 30; estimated area, 686 sq. miles. The surface, especially in the s. and s.e., is mountainous, interspersed with fertile valleys and fine pastures; but the surface near the coast is comparatively level. The chief mountain-ranges, rivers, and strike of the stratified rocks, run from s.w. to n.e., and the whole co. is an extensive slope in the same direction, from the Grampians to the Moray Firth, into which the rivers flow. The coast is rocky, but not high, except to the e. of Banff. The highest peaks are the North Cairngorm, 4083 ft.; Ben-a-main, 3874; Ben Rinnes, 2763; Corryhabbie, 2569; Knock, 1416. Ben Macdhui, 4295 ft., is partly in Banffshire. The chief rivers are the Spey, which bounds a third of the co. on the w.; and the Doveran, 60 m. long, and mostly included within the county. The predominant rocks are granite, quartz rock, mica-slate, clay-slate, syenitic greenstone, graywacke, graywacke-slate, old red sandstone with fossil fishes, metamorphic limestone, and serpentine. The serpentine near Portsoy has long been famous as the "Portsoy marble." Beryl and rock-crystal occur on Cairngorm. Lead, iron, antimony, and plumbago occur in small quantity. The soil in many parts is very fertile and highly cultivated. In 1878, a third of the surface of B. was in crop, the chief crops being oats, turnips, and grass. The breeding of cattle is the chief object of the farmer. In 1878, B. had 7797 horses, 43,702 cattle, 51,905 sheep, and 3496 pigs. The chief manufactures of B. are weaving, bleaching, tanning, distilling, and artificial manures. Glenlivet whisky has long been celebrated. The chief exports are grain, meal, and cattle. There are 12 fishing towns and villages along the coast. The herring-fishery is extensively carried on. The salmon-fisheries of the Spey and Doveran are very valuable, the Spey ranking after the Tweed and Tay as a salmon-river. B. is divided into the districts of Enzie, Boyne, Strathisla, Strathdoveran, Balveny, Glenlivet, and Strathavon. The chief towns and villages are Banff, Macduff, Portsoy, Keith, Cullen, Buckie, Dufftown, and Tomantoul. Pop. in '71, 62,023; with 107.7 females to every 100 males; 84.79 per cent of the children between the ages of 5 and 13 were receiving education. There are 23 civil parishes in the co., and 81 places of worship (of which 33 belong to the established church, and 24 to the free church). Valued rental of B. (1878–79), £221,123. The parliamentary constituency in 1878–79 was 2552. B., along with the counties of Aberdeen and Elgin, enjoys the Dick bequest (q.v.) for parochial education. Two thirds of B. belong to 4 landed proprietors. The co. returns one member to parliament, and Banff and Cullen unite with Elgin, Inverury, Kintore, and Peterhead in returning another. B. contains numerous remains of antiquity, the most remarkable being the old churches of Gamrie and Mortlach. The former built in 1010, and used for public worship till 1830, is called the "Kirk of Skulls," the bones of the Norsemen who fell on the neighboring field of Bloody Pots having been built into its walls. Mortlach was for a c. the seat of a bishop, but David I., in 1139, incorporated the see with that of Aberdeen.

BANGALORE, a fortified t. of Mysore, in a district of the same name, situated 70 m. n.e. of Seringapatam, in lat. 12° 58′ n., and long. 77° 38′ east. It is the chief military station of the British in the territory. In has a manufacture of silk; but that of cotton, is, or has been, far more important, having been at one time estimated to employ 3000 looms. The pop. of B. was (1872) 142,513. As the place is 3000 ft. above the sea, the thermometer, during six successive years, is said to have risen only twice above 90°, and then only to 92° and 93°. During the same period, the lowest temperature was 61°. B. was a favorite residence of Hyder Ali; and, in 1791, it was stormed by the British under lord Cornwallis. Water is good and abundant; and European vegetables grow in the gardens.—The district of B. has an area of 2914 sq.m. and a pop. of (1871) 828,354.

BANGKOK', the capital city of Siam, is situated on the banks of the Meinam, about 20 m. from the mouth of that river, in the gulf of Siam, and in lat. 13° 38′ n., and long. 100° 34′ e. The population is about 500,000, about half of whom are Chinese, in whose hands is centered nearly all the trade of B., which is large, as is shown by the commercial returns. The exports in 1871 were $6,132,913; in 1872, $6,684,390. The imports in 1871 amounted to $4,509,461; in 1872, to $5,247,729. For their right to trade here, the Chinese pay a poll-tax of about $3 on entering the kingdom, and a similar sum is collected from them every three years. The payment of this tax exempts them from the half-yearly servitude which all other oriental strangers resident in Siam are required to give. The approach to B. by the Meinam, which can be navigated by ships of from 200 to 300 tons burden, is exceedingly beautiful, the banks being skirted by fine trees full of gay birds. As the town is neared, numerous temples present themselves, and floating-houses become common; and finally, the whole city, with its rich gardens, and shining temples and palaces, bursts full upon the view. A large number of the houses float on rafts, and can be transferred from one place to another at pleasure. There are a few houses in the city built of brick and stone, but the greater part are of wood. There are usually in each house a division for males and one for females. The land-houses are raised upon piles, 6 or 8 ft. from the ground, and are reached by rude ladders—the daily flow of the tides and the annual inundations rendering this plan necessary. The floating-houses are made of bamboo-boards, wicker-work, or palm-leaves, and have generally a veranda in front, with a small wing at each end. The circumference of the walls of B., which are 15 ft. high and 12 broad, is said to be 6 miles. The internal traffic of B. is

chiefly carried on by means of canals, there being only a few passable streets in the whole city. Horses and carriages are rarely seen except in the neighborhood of the palaces. The chief interest of the kingdom of Siam, according to sir John Bowring, concentrates itself in Bangkok. B. is the constant residence of the two kings of Siam and their respective courts. The palace of the first king is surrounded by high walls, and is nearly a mile in circumference. It includes temples, public offices, accommodation for some thousands of soldiers, with their necessary equipments, a theater, and rooms for about 3000 females, 600 of whom are the wives of the king. The sacred white elephant has also a place within the palace. Throughout the interior are distributed the most costly articles in gold, silver, and precious stones. The palace of the second king, whose functions are not very clearly defined, is nearly as large as that of the first king, but not so ostentatious. See SIAM. The temples of B. are innumerable, and decorated in the most gorgeous style, the Siamese taking a pride in lavishing their wealth on them. Some of them, according to the Catholic bishop Pallegoix, have cost more than 4,000,000 francs (£160,000). In the neighborhood of B. are iron-mines and forests of teak-wood. The chief exports are sugar, pepper, cardamoms, ivory, feathers, hides, fine woods, rice, salt, and fish. By the treaty concluded by sir John Bowring in 1855, the Siamese reserve the right to prohibit the exportation of salt, rice, and fish, in cases of threatened scarcity. The imports are tea, manufactured silks and piece-goods, opium, hardware, machinery, and glass wares. In 1872, 336 vessels of 132,012 tons entered, and 294 of 136,148 tons, cleared the port. See sir John Bowring's *Siam*.

BANGOR, an episcopal city, borough, and seaport t. in the n.w. of Caernarvonshire, North Wales, on the s.e. bank of the Menai strait, 2½ m. from the Britannia bridge, and 59½ w. of Chester. It consists chiefly of a narrow crooked street, a mile long, stretching s.w. through a narrow fertile valley, bounded on the s. by steep precipices. The grandeur and beauty of the surrounding scenery has long made it a favorite resort, and the opening of the Chester and Holyhead railway, on the great line of communication from London to Dublin, has greatly promoted its prosperity. The town has of late years been greatly improved, and mostly rebuilt. Its chief trade is derived from the great slate-quarries of Llandegai, 6 m. distant, and employing 2000 men. The slates are exported to all parts of the world, and also manufactured at B. into tables, chimney-pieces, etc. Pop. '71, 9859. B. unites with Caernarvon, Conway, Criccieth, Nevin, and Pwllheli, in sending one member to parliament. B. is a place of great antiquity. In 525, St. Deiniol founded a college here. It was raised to a bishopric in 550, the founder being the first diocesan. The cathedral founded by him was destroyed by the Saxons in 1071, rebuilt in 1102, and again destroyed by fire in 1402. The present edifice, built between 1496 and 1532, is a plain embattled cruciform structure, 214 by 60 ft., with a pinnacled tower 60 ft. high. Several Welsh princes and distinguished ecclesiastics are buried here. B. bishopric is the oldest in Wales.

BANGOR, a small seaport t. in the n.e. of the co. of Down, Ireland, on the s. side of the entrance to Belfast lough, and 12 m. e.n.e. of Belfast, with which it is connected by rail. Passenger steamers also ply daily during the summer months between B. and Belfast. Pop. '71, 2560. Cattle and provisions are exported. Lead is found at Conlig in the neighborhood. It is a favorite watering-place of the middle classes of Belfast. St. Cungall, in 555, founded Bangor abbey ("Ban-choir," the "White Choir," whence the name Bangor). From this abbey, Alfred selected professors when he founded the university of Oxford. In the 9th c. it had 3000 inmates.

BANGOR, a city in the state of Maine, 231 m. n.e. of Boston, on the right bank of the Penobscot, about 60 m. from its mouth, and at its confluence with the Kenduskeag, which intersects the city, and affords an extensive supply of water-power. At spring-tides, which here rise 17 ft., the harbor is accessible from the sea for the largest vessels, and as the navigation cannot go higher, B. is one of the largest lumber depots in the world, absorbing and monopolizing the trade of the heavily-timbered basins of the Penobscot and its tributaries. About 2000 vessels are annually employed in the trade. B. possesses several churches, a theological seminary, foundries, planing and sawing mills, etc. There are two daily and four weekly newspapers. Steamboats run between B. and the adjacent ports of Portland and Boston, and it is a station on the Penobscot and Kennebec railway. Pop. '70, 18,290.

BANGOR (*ante*), one of the most important cities in Maine. Fort Norumbega was built here, in 1656, by the French; and it was thought that a great city of that name existed (alluded to by Milton in *Paradise Lost*, in Burton's *Anatomy of Melancholy*, and by other authors). In 1769, the settlement, now under English rule, was called Kenduskeag. Finally, it got its present name from the well-known psalm tune, which was a great favorite with its minister, Seth Noble. It was incorporated as a city in 1834, since which time it has grown to nearly 30,000 in population. A navigable river, railroads, and abundant water-power combine to make B. a great manufacturing city. It is the seat of justice of Penobscot co., and a port of entry, with a capacious, safe, and easily accessible harbor. The city is on both sides of the Kenduskeag, over which there are several bridges; and over the Penobscot there is a bridge a quarter of a mile long, connecting the city with the suburb of Brewer. B. is one of the greatest lumber marts

in the union, employing more than 2000 vessels in the business. It is the seat of a Congregational theological seminary.

BANGORIAN CONTROVERSY. Dr. Benjamin Hoadley, bishop of Bangor, in a sermon preached before George I., Mar. 31, 1717, on the text, "My kingdom is not of this world," advanced opinions regarding the constitution of the church which excited strong opposition from the zealous advocates of ecclesiastical authority. A controversy ensued, which was carried on with great heat for many years, and resulted in a ponderous collection of pamphlets. See HOADLEY.

BANGOR-ISCOED (Bangor below the Wood), an inland village, beautifully situated, in a fertile and richly-wooded country, on the right bank of the Dee, on the borders of Flint and Denbigh shires, North Wales, 5 m. s.e. of Wrexham. Pop. of township (1871), 574. It was once the seat of one of the largest monasteries in Britain. This monastery was founded before 180 A.D., and contained 2400 monks in the time of St. Augustine, in the end of the 6th c., when they distinguished themselves in resisting the claims of the papal see. Ethelred, king of Northumbria, in 593, devastated the monastery, and massacred 1200 of the monks.

BANGS, NATHAN, D.D., 1778–1862; b. Conn.; a Methodist minister, commencing as in itinerant in 1801. He labored seven years in Canada, and came to New York in 1810. In 1820, he was chosen agent of the Methodist book concern; in 1828, chosen editor of the *Christian Advocate and Journal*, and in 1829 elected bishop of Canada, but declined. In 1832, he was editor of the *Methodist Magazine and Quarterly Review*; in 1836, secretary of the church's missionary society; in 1841, president of the Wesleyan university, but soon afterwards returned to pastoral work in New York. Dr. B. was the author of *Predestination Examined, Reformer Reformed, Life of Arminius, History of Missions, History of the Methodist Episcopal Church*, etc.

BANIALU'KA, a fortified t. of Bosnia, European Turkey, situated on the left bank of the Verbas, with a manufactory of gunpowder, and numerous bazaars and public baths. Pop. 8000.

BANIAN (from the Sanscrit *banij*, a merchant), a word used in India to designate a merchant or trader generally. It is more particularly applied to the great merchants in the w. of India, especially in the seaport towns of Bombay, Surat, Cambay, etc., who carry on a very extensive trade by means of caravans with the interior of Asia, even to the borders of Russia and China. Contrary to the general custom of the Indian people, these merchants travel much, and the establishments and counting-houses of Indian banians are to be found in almost every commercial town of any note in Asia. The banians form a class or division of the caste (q.v.) of the Vaisya, adopt a peculiar costume, and are strict in the observance of fasts and in abstaining from the use of flesh.

BANIAN DAYS, a sailor's phrase, nearly equivalent to the *jours maigres* of the French. The term denotes the days when no meat is served out to a ship's crew. Banian days have no longer any existence in the royal navy. The term is derived from the practice of the banian (q.v.) traders.

BANIAN-TREE. See BANYAN.

BANIM, JOHN, a celebrated Irish novelist, b. 1800, whose pictures of manners, in the form of tales, have excited considerable interest in England. His aim was to become for Ireland what Scott had been for Scotland. He has given proof of vigorous intellectual grasp and vivid fancy, in a series of pictures of life, in which he delineates the peculiarities of the Irish character in strong light and shade, and appeals forcibly to the national feeling. His *Tales of the O'Hara Family* (London, 1825) were followed, in 1826, by a second series, which did not disappoint the high expectations excited by the first. Of these, several have been translated into German by Lindau. Next appeared *The Battle of the Boyne, The Croppy* (1828), *The Denounced* (1830), *The Smuggler* (1831), *The Mayor of Windgap, Father Connell*, etc. In 1837, general sympathy having been attracted towards B.'s privations, occasioned by disease that precluded all literary exertion, a pension of £150 per annum from the civil list was awarded him by government, which was afterwards further increased by £40 for the education of his daughter, an only child. He died in poverty on the 1st Aug., 1842, at Windgap cottage, near Kilkenny.

B. failed in his attempt to portray the manners and frivolities of the higher classes; but none of his predecessors, such as Edgeworth, Morgan, and Crofton Croker, have succeeded in depicting so vividly and truly the Irish peasant, with his picturesque peculiarities in his sufferings and errors. Although generally happy in the plot and development of his story, he is too much disposed to dwell on the horrible. His denunciations may be well founded, but they disturb the poetic effect. B. was also not quite free from a somewhat tiresome minuteness of description, and his imitation of Scott is frequently very palpable.

BANISHMENT, excepting in the penal sense of transportation (q.v.) with which it is popularly synonymous, can only now be said to have a legal meaning historically. Formerly, in England, parties who were required to *abjure the realm*—that is, renounce

and depart from the country—were, so to speak, *banished;* but the word appears to have a more technical and precise significance in the Scotch law than in the English, and in Scotch law-books, is defined as the punishment of exile from Scotland inflicted on persons convicted of certain offenses for which that punishment is provided. But as a punishment, it has either been abolished in that country by express enactment or become obsolete by disuse. See TRANSPORTATION, PENAL SERVITUDE.

BANISTER, a corruption of baluster (q.v.).

BANISTER. See HALIFAX COURT HOUSE.

BANJERMASSIN, a large kingdom on the s.e. of Borneo, has an area of 5880 sq.m., and a pop. of about 150,000 souls, chiefly Mohammedans. Since 1860, it is governed by the Dutch resident for the s. and e. of Borneo, who has an assistant at Martapura, where the sultans formerly lived. B. is watered by large rivers and intersected by a chain of mountains, in several parts rising to 3000 feet. Excellent small arms are manufactured. The products are pepper, wax, edible nests, rattans, benzoin, dragons' blood, coal, iron, diamonds, and gold-dust.

B., the capital of the residency, is built on the island Tatas, about 12 m. from the mouth of the Banjermassin or Barito; pop. 35,000. In 1871, the population of the residency numbered 326 Europeans and 847,846 natives. There is a considerable trade in native products, and the imports are piece-goods, gunpowder, rice, sugar, Chinese porcelain, silks, and a few horses from Java.

BANJOEMAS', a t. of Java, 22 m. from the s. coast, in s. lat. 7° 33′ 45″, and e. long. 109° 19′ 20″. It is situated at the opening of an extensive and fruitful valley on the left bank of the Serajo. It is well built, and carries on a considerable trade Pop. 9000. B. is the residence of a Dutch governor, and has a fort and garrison. It is the capital of a province of the same name, which produces coffee, sugar, indigo, rice, tobacco, etc.

BANK—BANKING. A banker lends money at interest, usually for short periods on satisfactory security, and receives money on deposit, for which he sometimes allows interest and sometimes does not, but merely keeps it safely for the depositor. Some banks —notably the bank of Amsterdam, which, during the 17th c., was the great warehouse for bullion in Europe—were simply custodiers of coin and bullion lodged with them, for which they granted receipts transferable from hand to hand, entitling the owners to get back the gold or silver, in coin or bullion as originally deposited. But money lying in such banks was unproductive, and indeed entailed upon the owners considerable charges to pay the necessary expenses of management. In recent times the competition for money by borrowers has become so keen, and the outlets for lending it safely so numerous, that banks of this class are no longer needed. They have in fact all passed away, and the business of receiving money is now universally combined with that of lending it out. A banker does not hoard all the money deposited with him; he gives the greater portion out on loan. The advantages accruing to society from the operations of banking are thus immensely increased. A banker receives from all around him the sums of money, both small and great, which would otherwise be useless in the coffers of the owners, and lends it to those who can employ it to advantage and could not otherwise obtain it. Capital hitherto lying useless and unproductive becomes through his agency useful and productive. The direct advantages arising from such transactions are considerable. The banker, if the money is allowed to lie with him for some time, will pay the depositor interest upon it, will lend the amount to a borrower who will engage in some business transaction with it and make a profit thereby; and the banker himself will make a profit upon the difference between the interest allowed to the depositor and charged to the borrower. But besides the direct advantages, the indirect advantages are not less important. With the money thus lent out, manufacturers can purchase raw material to be worked up, and procure food and clothing for their workmen; and traders can go into the markets and purchase commodities for resale. Commodities are thus more quickly turned to useful purposes, and a stimulus is given to the production of more. But a banker deals not with the money only of others; he uses money belonging to himself. This is his *capital.* Few would be found to deposit their money with a person known to possess none of his own. If he should lend deposits to those who fail to repay them—that is, *make bad debts*—he has the means from his capital of replacing the deposits thus lost.

The services that a banker performs as the cash-keeper of his depositors are very great. In the case of persons not themselves in business, it is quite usual for a banker to make all their money-payments, beyond their small daily expenditure, and to receive the money payable to them. The money transactions of such persons are thus contained in their banker's books. This is effected by the depositor giving a check or order on his banker for the sums he has to pay; and by handing to him all the *checks* or orders the depositor receives for sums payable to himself. Suppose a person's income derived from dividends on government stock: he sends a *power of attorney* or authority to his banker to uplift the dividends for him. These are received by the banker as deposits, and are drawn out by the depositor as occasion occurs, by checks issued by the depositor to those to whom he requires to pay it away. So he may receive money due to him by a check given to him by his debtor. This check he sends to his banker, who will

obtain payment. If both persons deal with the same banker, a simple transfer in his books will carry through the transaction; and if the bankers be different, and each has received, in the course of his business, as is always happening, a check on the other, there will be a set-off between them; and two payments will be made as well as two deposits, without trouble to the persons concerned, and without the employment of any money. But this mode of managing one's pecuniary transactions is not confined to the case of those not engaged in business; on the contrary, it is followed on a scale out of all proportion greater in carrying through the money transactions of those in business or trade in the principal industrial countries.

Besides thus performing the function of cashiers to their depositors, in consideration of the profit made on their deposits, many banks allow their depositors interest on their deposits. The rate allowed is, of course, always less than that received by the banker. Frequently a depositor bargains with the banker not to draw out his deposit without previous notice, longer or shorter as may be agreed on; and in this case the banker will allow a higher rate of interest than when the deposit is repayable *on call*—that is, at any time, without previous notice. The practice of allowing interest on deposits has prevailed in Scotland since 1729, but in England is of later growth, and not invariable; the rule there being rather to allow interest on fixed deposits only, and to allow no interest on money at call or on current accounts. It has led, of late years, to a great increase in the amount of deposits. Many persons prefer the low rate of interest which banks give, to the higher rate which may be obtained from individual borrowers, or to the greater return which may be received if they traded on their money.

Occasions are always occurring for withdrawing deposits, as well as making them. Traders and commercial men, for example, day by day, deposit with their bankers the drawings or sums of money which they receive in the course of their business; and, on the other hand, day by day, draw out such sums as they require to pay away in purchases of goods, in wages, rent, and other expenditure. A bank, therefore, while continually receiving deposits, is continually repaying deposits; and the amount uncalled for is subject to a daily fluctuation. At one period of the year, or in a certain condition of trade, the amount of deposits may be high; at another, low. As it is a principle, at the very root of banking, that money deposited shall be returned, either on demand, or punctually at the expiry of a stipulated notice, it follows that banks must always have in their coffers as much of the money deposited with them as there is the least likelihood of being called for by depositors. When business is in its ordinary condition, a bank can, after some experience, approximate pretty nearly to the amount of the greatest demand for a return of deposits throughout the year, and provide accordingly. But sometimes the credit of a bank becomes doubted, either from causes peculiar to itself, or on occasions of a *panic* or general distrust, when all who own money wish to have it in their own possession. In these cases, there is a *run* on the bank for repayment of its deposits, and the amount called for may be far beyond the maximum demanded in ordinary times. If the bank has not retained as much of the deposits in its coffers as meet the demand, it is said to *suspend payment*, and, as a general rule, it must wind-up its business; the confidence of the public that it will in future restore its deposits on demand being now destroyed. There are two prime rules in safe banking: the one is, that the bank shall lend its deposits only on undoubted and readily reliable securities, however low the profit; and the other is, that the bank shall retain a sufficient amount of its resources—and this is called the *reserve*—to meet the possible demands of the depositors, even in cases of a run, although there may be no reason to expect one; for when a run comes, it seldom casts its shadow before. But it is evident that the greater the *reserve* of a bank, the less the amount of deposits which it can lend out and draw interest for; hence the temptation which banks lie under of imprudently lending out a too great proportion of their deposits; and it is their yielding to this temptation which almost always precipitates the failures of banks.

The *reserve* of the banking department of the Bank of England is always in coin, or, what is the same thing, in notes against which there is coin lying in what is called the *issue* department of the bank. In the case of all other banks in this country, the reserve is only partly in coin; sometimes the proportion of coin is very small. A great portion of the reserve is generally in Bank of England notes, equivalent, of course, to coin. These other banks also hold a portion of their reserve, in the shape of government stock, in which they have invested it. In this way, the banks obtain a return on this last portion of their reserve, in the dividends or interest paid by government on the stock—this return being less, indeed, in the usual case, than if the bank had lent out the money in the ordinary course of business, but better than no return at all, as must be when the coin or notes are lying idle. The reason why government stock, in Great Britain, is a safe reserve is, that it is sure to command a purchaser at all times. If there be a run on a bank, it immediately finds a purchaser for the stock, and with the price, whether paid in gold, or in Bank of England notes, the only other legal tender, it meets the demands of its depositors. Sometimes, a bank has its reserve in the form of a deposit at the Bank of England; or, if a provincial bank, with some London bank which has its own reserve there. From the Bank of England being the channel through which, directly or indirectly, payments are made, and moneys received, by other banks, it is more convenient for them to have their reserve lying as a deposit in it than lying as

gold within their own walls. In the case of a demand on their reserve, the banks will draw out their deposits, in notes, or, if gold be in demand, in gold, from the Bank of England. Whether, therefore, the reserve of a bank is invested in government securities, or is deposited in the Bank of England, or is in Bank of England notes, it is from the coin in that bank that the gold comes in the case of a run. It is apparent from this that it is essential to the stability of all banks in this country, so long as they themselves do not keep a sufficient reserve of coin in their coffers, that the Bank of England shall always be possessed of coin, and never be unable, on demand, to pay its depositors in gold, or to give gold in exchange for all its notes that may be presented to it. It may be added, that while banks gain, through the annual dividends, in keeping their reserve in government stock, they run the risk of a loss in the event of their requiring to sell it in the time of a panic. For at such a time, when many securities and stocks become unsalable, and all of them suffer depreciation in value, government stock itself falls in price, although less so than the others. Banks often invest portions of their reserve in other stocks than government stock. The higher return obtained on these other is, however, outweighed by the greater risk of depreciation in their value, whether continued unsold or thrown into the market for sale in times of panic.

We have hitherto been treating banks as banks of *deposit* and *loan;* but many of these banks, in all countries where banks are known, are also banks of *issue.* Banks of deposit, as has been mentioned, make loans from their capital and deposits. If from capital, the banker has no greater profit by the transaction than if he had lent out his money in any other way, equally safe, and involving the same amount of trouble. If from deposits, the interest he receives, in so far as it exceeds the interest, if any, paid to the depositors, and a ratable proportion of the expense of carrying on the business of the bank, is pure gain to him. But a banker may give the loan from his own notes, and in that case his gain is still greater. A bank-note is simply a written promise by the bank issuing it, to pay to the bearer, on demand, a sum of money—that is, in coin of the realm. Of course, the borrower would not accept a loan from a bank in its own notes, unless he believed that it could redeem its promise of paying in coin, and that the public were of the same opinion; for the moment that a suspicion arises that the promise will not be made good, the note will cease to pass from hand to hand as coin, or to perform all the functions which coin performs. But when the loan is accepted in a bank's own notes, it is evident that the interest which the bank draws for the loan of its promises to pay is pure profit, except the rateable proportion—as in the other cases—of the expense of carrying on its business, and the expense of the paper and printing of the notes with the government stamp duty. In other words, a bank which can get people to pay to it interest for the loan of its promises to pay, draws the same income—barring the comparatively trifling expense of manufacturing the written promises—as a bank does which has to provide itself with gold for making its loans. The motive which a bank has to extend its issues on loans is therefore apparent, so long, of course, as it is not compulsory on it to retain unemployed in its coffers as much in gold as it issues in notes.

But it does not follow that when a bank makes a loan in its own notes for a definite period, it will really obtain the benefit of the whole of the interest on it for that period; for the borrower does not apply for the notes that he may keep them beside him, but that he may pay them away in making a purchase, or in liquidating a debt, and this, most commonly on the very day he receives them. If the person to whom the notes are thus paid by the borrower has himself no purchase to pay for, or no payment to make, he may, the moment he gets them, return them to the bank that issued them, to lie there on deposit. If the bank pays interest on deposits, as most banks do, then out of the interest drawn by it on the original loan, it will have to pay interest to the depositor of the notes; in other words, the loan is no longer a loan of its notes, but a loan from its deposits. Or, the person receiving the notes from the borrower, may immediately present them to the issuing bank for coin, instead of depositing them. Here, too, therefore, the loan that was made in notes is now converted into a loan of coin, that was in reserve from previous deposits, or that was part of the bank's own capital; in which cases, the bank obtains no advantage whatever in having made the loan originally in its notes. It might equally well, so far as profit is concerned, have originally made it in gold from its reserve of deposits or capital. Notes generally find their way back to the bank that issued them through other banks, into which they have been paid as deposits, or for the liquidation of debts due to them. These banks suffer the loss of profit or interest on the amount of the notes thus received by them so long as they keep them; they therefore immediately present them to the issuing bank for gold, to replenish their own reserves, or to lend out; or, what is the same thing, they present them to the issuing bank for government stock, or other securities bearing interest, and which that bank has had to provide from its capital and deposits.

It will now be apparent to the reader that there are two checks which prevent a bank issuing notes to any extent it pleases. In the first place, there must be a demand for its notes by borrowers. It is only to people in good credit, and likely to make a profitable use of them, that a bank will lend its notes, and such people will not take an increase of loans unless trade is increasing, and new opportunities be presenting themselves for profitably employing the notes borrowed. True, banks, when imprudently conducted, or when deceived in the character of their customers, frequently lend their notes to reck-

less persons, who overtrade with them, and become bankrupt. But banks commit this error when they do commit it, to a far greater extent by loans of their deposits and capital than by loans of their notes. In the second place, the immediate return of the notes, chiefly through other banks for gold, or for other portions of the reserve of the issuing bank, is a check to its issuing more notes than it has a reserve to meet. This return of notes through banks is called the *exchange* of notes—the notes issued by a bank being returned to it in exchange for the notes held by it of another bank.

Besides issuing its notes in loans, a bank may issue them in repayment of deposits. In this case, there is the same profit to the bank as in the other case. The bank gets the profit which it makes on the money which was originally deposited or lodged with it, without having to pay interest to the persons who made the deposit or lodgment; the deposit, or money lodged, having now been repaid in its notes. But here, too, these notes are equally liable to be returned to the issuer as when they are issued on loans.

Of all the notes issued, in whatever way, by banks, a certain amount is not returned to them, but is kept in circulation, being what is required by the necessities of the public for use as money, passing from hand to hand. It is of course on this portion that the banks make their profit; and, in consequence of this profit, they are able to afford banking facilities to the public more cheaply than they could otherwise do. The profit is just the interest on the notes in circulation—less the expense of manufacturing the notes, a ratable proportion of the expenses of conducting the banks, and the loss of interest or profit on an unemployed reserve kept from prudence, or by the requirement of law, to meet a return of notes. This interest is paid by the persons who originally borrowed these notes from the banks, and who have not repaid them; or if the banks have repaid deposits with the notes, the interest is paid by those to whom they lent what was originally these deposits. The amount of the bank-notes in circulation varies at different periods of the year: at term-times and quarter-days, when more payments than usual are made, there is a greater quantity of money required by the public than at other times, and the notes in circulation increase in amount. This addition to the circulation is drawn from the banks by the depositors or borrowers. After it has served its purpose, this additional quantity gradually returns to the banks as deposits or in repayment of loans. If the credit of an issuing bank is at any time suspected, the holders of notes will present them for gold, just in the same way as its depositors will call for a return of their deposits; and this risk must be provided against by a corresponding increase of its general reserve, on which, of course, it makes no profit. It has been generally imagined that, when issuing banks suspend payments on a run, the run is one on the part of their note-holders; but this is only a popular error. In a well-established bank, the amount of its notes in circulation is of little importance compard to its de osits; and though the holders of small sums in notes may be more apt than depositors to take alarm and rush in a panic to the bank for gold for its notes, a small proportion of its depositors suddenly demanding a return of their money in gold, as effectually drains a bank of its reserve, as if its whole circulation were to be at once presented to it for gold.

Banks make their loans chiefly in the form of *discounts;* that is, upon bills of exchange. Commodities in the wholesale market are generally sold on credit. The buyer promises to pay the amount at a certain date to the seller, and his promise is contained in a bill of exchange. The seller transfers it to a bank, which, on the faith of it, advances the amount in loan to him, less *discount* (q.v.), that is, interest of the money till the bill be due. This is called *discounting.* But banks lend on other securities. A holder of government stock, for example, will obtain a loan on the security of his stock: the banker being entitled to sell it, and repay the loan from the price, if the borrower fail to make punctual payment. So also, the holder of stock or shares in any public company, as a railway company, or of a debenture or bond due by such, will, where the company is believed to be in a sound condition, or the security is salable, obtain a loan from a bank. The owners of commodities lying in a public warehouse, may obtain a loan on depositing with the bank the *warrants* or certificates of ownership. Loans, too, are occasionally made for short periods on the mere note of hand of the borrower, when the banker is satisfied of the ability of the borrower to repay the money. It is seldom in Scotland that banks lend on mortgages over land. Borrowers, in these cases, generally take loans to lie unpaid for a few years; but to have his money locked up in that way does not suit the trade of a banker. Where a banker finds the security which he has received to be insufficient, and repayment of the loan is not forthcoming, he will, of course, like any other trader, to avoid making a bad debt, take any other security the debtor can give him—such as a manufactory or a mine. Banks have in this way frequently become involved in manufacturing transactions, in their attempts to make more money of the securities than they would have done by an immediate sale of them; they have become manufacturers and miners, and suffered great losses in consequence. And it is not to be supposed that banks always abstain from making loans when the security is known to be doubtful; far from it; banks, like other commercial establishments, have been, on many occasions, recklessly managed. In trying to push business, they have made loans on insufficient security, and banks are under strong temptation, to which they frequently yield, when a trader largely indebted to them is approaching bankruptcy, to sustain his credit by additional advances, in the hope that he may retrieve his affairs, and pay in full

both the old and the new advances. The result is often the loss of both. Conduct of this kind has been the ruin of many banking establishments in England, of two or three in Ireland and Scotland, and elsewhere.

Bankers perform another very important function: they *remit* money from one place to another. One illustration will serve to explain how this is managed. A debtor in Edinburgh makes a payment to his creditor in London in this way: he pays the money to a banker in Edinburgh, who, for a small charge, called the *exchange*, gives him a draft for the amount on a banker, his correspondent, in London. The debtor transmits the draft to his creditor, who presents it to the London banker, and receives the money from him. No actual transmission of the money, however, takes place, for there are debtors in London requiring to pay money to creditors in Edinburgh, and these debtors effect the payment by giving the money to the London banker, and obtaining his drafts on the Edinburgh banker. The one set of drafts are thus set off against the other. Not only may remittances between two places be thus made without the use of money, but the payments in both places may also be made without it. The debtors may pay for the drafts by checks on the banker who grants them, and the creditors may receive the money by drawing checks on the banker by whom the drafts are made payable. For another function of banks, see MARGINAL CREDITS.

The large amount of money transactions carried through without the intervention of coin or bank-notes, in a country like England, is inconceivable to those not engaged in business pursuits. The manner in which these transactions may be effected without money, would be at once apprehended, if all persons in the same locality dealt with the same bank, and if all the banks scattered throughout the kingdom were only branches of the same establishment. But in practice, matters are so managed as if this were the case. The checks, bills, or other drafts which come into the hands of a banker, drawn on (that is, payable by) other bankers, are set off and liquidated by drafts, which they have received, drawn on him. The balance or difference only is paid in money. In London, the center of the money-world, there is an establishment called the clearing-house (q.v.), of which most of the London banks are members. There, at a fixed hour daily, attendance is given by a clerk from each of these banks, who presents all the drafts immediately payable which his bank holds on the others; the balance or difference, on the whole, for or against each bank is ascertained; and the bank which holds a less amount of drafts on others than they hold on it, pays the difference by checks on the Bank of England. The lowest clearing for an entire week between the 4th of Oct., 1877, and 2d Oct., 1878, was £71,120,000, and the highest £133,921,000. The total clearings from Oct., 1877, to Oct., 1878, were £5,066,533,000. There are similar clearing-houses in some provincial towns.

Bank of England.—This bank, the most important in the world, was projected by William Paterson (q.v.), and was incorporated July 27, 1694. It was constituted as a joint-stock association, with a capital of £1,200,000, which was lent at interest to the government of William and Mary, at the time in a state of embarrassment. At its very outset, therefore, the Bank of England was a servant of government; and in a lesser or greater degree, it has enjoyed this character through all the stages of its subsequent history. At first, the charter of the bank was for 11 years only; but in consequence of the great services of the institution to government, its charter has been at various times renewed. The last renewal was in 1844, and the charter of that year still subsists, its terms being subject to modification or revocation by the legislature at pleasure. By the act or charter of 1844, the bank was divided into two departments—the *issue* and the *banking*. What led to the division was this: it was supposed that, when a foreign drain of gold from us set in, it would, if the currency or circulation in this country had been purely metallic, have produced a contraction of the circulation, and a consequent fall of prices, and, as an ultimate result, the cessation of the drain. It was further supposed that banks could issue their notes to any extent they pleased; that their excessive issues increased the currency, and therefore increased prices, which in their turn led to foreign drains; and that, on the occasions of these drains, the continued issues prevented the natural and desirable contraction of the circulation, and aggravated the commercial convulsions occurring at such periods. The object of the act of 1844 was to prevent issues of notes beyond a certain amount, unless against an equal amount of gold held by the issuing bank, so that the mixed currency of notes and coin might thus expand and contract like a self-acting metallic currency. Experience, however, has shown, that when these foreign drains occur, the gold exported is taken chiefly from the reserves in the Bank of England, being withdrawals of deposits or loans by the bank; and that the amount of notes in the hands of the public has not been affected by the legislation of 1844. In practice, whenever there are signs of a foreign drain, and the reserve of the bank is diminishing, the bank counteracts the tendency to a drain by raising the rate of discount and restricting its loans; the purchasing power of the public is thereby limited, and prices kept down; and, at the same time, gold is attracted to this country for investment. The circulation is in reality not interfered with. It was also intended by the act of 1844 to add to the security of bank-notes by insuring a supply of gold to meet the payment of them at all times. But the solvency of the Bank of England is undoubted; its notes would at any time be taken as gold; and this effect of the act of 1844, and the supplementary act of 1845, has in the case of the notes of other banks been hitherto inappreciable.

In the *issue* department of the Bank of England, its sole business is to give out notes to the public. Before the separation of the departments, the government was due to the bank £11,015,100. This sum was declared to be now a debt due to the issue department, and for the issues of notes to that amount, no gold requires to be held by it. This was just the same thing as if the bank had originally lent £11,015,100 of its notes to government, and these notes had found their way into circulation. The bank was also allowed to issue additional notes on securities—that is, to lend them to a limit which at present amounts to £3,984,900, and this also without holding gold. The amount of notes which may thus be issued, without gold being in reserve against it, is £15,000,000. All notes issued above that amount can be issued only in exchange for gold. At the passing of the act in 1844, the limit of notes to be issued against the government debt and securities was fixed at £14,000,000—past experience having shown that there was not the least risk of their being at any time less than that amount of Bank of England notes in the hands of the public. The addition of the £1,000,000 is an extra issue, authorized by the act, in consequence of certain issuing banks having since ceased to issue. The bank has to account to government for the net profit of this issue loan of notes of £1,000,000, and the profit the bank derives from its issue department is the interest received on the £14,000,000 of government debt and securities, which, at 3 per cent, is £420,000 yearly. But out of this the bank pays to government, for its banking privileges, and in lieu of stamp-duties, £180,000. If we assume the expense of the issue department to be £160,000, the net profit upon it would be £80,000. The bank also makes a profit upon bullion and foreign coin. These are brought to the bank for notes; they are worth £3 17s. 10½d. per ounce; but the bank is obliged by its charter to purchase them at £3 17s. 9d. The holders prefer taking this price to having their bullion and foreign coin coined, free of charge, at the public mint, as the delay in the coining is equal to a loss of interest of 1½d. per ounce. The amount of notes in the hands of the public averages about £25,000,000; but the amount issued by the *issue* department is greater. The difference is the amount lying in the *banking* department, and represents the reserve of gold of that department; that is to say, the banking department retains only a half or three fourths of a million of coin, and transfers the bulk of its reserve to the issue department, in exchange for notes. We therefore require to regard the reserve of the banking department as gold, though lying in the shape of notes issued by the other department.

Viewed in its *banking* department, the bank differs from other banks in having the management of the public debt, and paying the dividends on it; in holding the deposits belonging to government, and making advances to it when necessary; in aiding in the collection of the public revenue, and in being the bank of other banks. For the management of the public debt, the bank receives about £247,000, against which there has to be set £124,000 of charges. The remaining profits of the bank are derived from its use of its deposits, on which it allows no interest, and of its own capital. The capital was originally £1,200,000; in 1816, it reached £14,553,000—the present amount. There is besides a rest of about £3,500,000. In 1877-8 the public deposits varied from £3,422,248 to £19,852,358, and the private from £19,629,343 to £27,321,423; the maximum of deposits, public and private, was £43,047,038.

In 1797, the bank found itself likely to be obliged to suspend payments, and its notes were declared by law a legal tender, although no longer convertible into coin. This state of matters continued till 1821. The notes during this interval not having been convertible into coin on demand, there was no check upon the bank in the amount of its issues; and the currency became depreciated—that is, a £5 note would not exchange for five sovereigns; and every man to whom £5 was due, was thus obliged to accept payment in a £5 note, not worth £5. It is, however, said that the value of gold at the time was enhanced owing to absorption by hoarding and by military-chests, and that the depreciation was more apparent than real. The export of gold following on a rise of prices occasioned by an issue of bank or government notes is unlimited, except by exhaustion, if these notes are not payable in coin on demand, and are issued without any check from without or self-imposed. But as prices estimated in these notes rise, the price of bullion, like other commodities, rises too, and the price of coin which can be converted into bullion, or be used abroad at its previous purchasing power, rises also. Since 1821, the bank has been oftener than once on the verge of a suspension of payments, owing to foreign drains of gold. The separation of the bank into two departments is regarded by many as having a tendency to produce a suspension in times of panic, when the reserve is reduced by withdrawals to supply a foreign drain, or to meet an internal run. Before the separation, the bank, in the case of withdrawals of gold, had the whole amount of gold within the bank to meet them; but now it loses the command of all the gold in the issue department. It cannot get that gold unless in exchange for notes, but, its reserve being reduced or exhausted, it has none to spare. The restriction of credit consequent upon the approach to an exhaustion of the reserve of the banking department, is so great, that the fear of it occasions a panic; and in 1847, 1857, and 1866, on the possible suspension of payments by the banking department, owing to a reduction of its reserve, being apparent, the government of the day took the responsibility of authorizing the bank to lend additional notes, not represented by gold, which was an indirect way of getting at the gold in the issue department, where the object of

the borrowers was to obtain gold. In 1857, it was found necessary to take the benefit of this authorization.

The bank of England is situated in the center of London; but it has a branch in the w. end, and nine branches in the provinces.

Joint-stock Banks in England and Wales.—In 1878, there were 119 of these banks, of which 52 in the provinces were entitled to issue notes to the amount of £2,164,221 without its being compulsory to hold any gold against them. But as they are prohibited from exceeding their authorized issue, the amount of notes actually in the hands of the public is always somewhat less. The deposits of the 10 joint-stock banks in London which may be considered London banks, and excluding the national provincial bank of England, the national bank, and the Scotch banks, who, although they carry on business in London, have the great bulk of their business in the country, amount to about £80,000,000, and the acceptances granted by them to about £17,000,000. Their paid-up capital is £9,270,000.

They all, it is understood, allow interest upon money deposited to remain for some time, but generally do not allow interest on money lodged upon current accounts or at call.

Private Banks in England and Wales.—Of these there were 248, of which 56 were in London. Of the provincial banks, 108 had an authorized issue of £2,295,073.

In the case of all these banks, whether issuing or non-issuing, their profits are chiefly derived from the use of their deposits.

There are also in London, 56 foreign, Indian, and British colonial joint-stock banks.

Banks in Scotland.—The earliest banking institution in north Britain was the bank of Scotland, instituted by a charter of incorporation from the Scots parliament in 1695. The original capital was £1,200,000 Scots, or £100,000 sterling. In 1774, the amount of stock was extended to £200,000 sterling; now it is £1,250,000 sterling. In 1727, a new and similar establishment was constituted under the title of the royal bank of Scotland, whose advanced capital is now £2,000,000. In 1746, another association was formed, and incorporated by royal charter, with the title of the British linen company. From £100,000, its capital has increased to £1,000,000. Besides those three banks, there are in Scotland other seven joint-stock banks, with capitals varying from £1,000,000 to £150,000. There are now no private banks. The amount of deposits is probably about £70,000,000, on which interest is allowed. Their authorized issue of notes is £2,676,350, but their actual issue is about double that amount. The western bank, with a capital of £1,500,000, a circulation of above £400,000, having 1300 share-holders, and about 100 branches, suspended payments in 1857, owing to a reckless system of discounting bills. The share-holders, however, being under unlimited liability (see JOINT-STOCK COMPANY), neither the depositors nor the note-holders sustained any loss. In Oct., 1878, the city of Glasgow bank, with 133 branches, suddenly suspended payments; the liabilities amounting to £12,400,000, and the estimated assets, £6,300,000, leaving a probable deficiency of £6,100,000. It was found that for three years before the stoppage, the states of the bank's affairs, issued annually to the share-holders, had been falsified, and that advances had been made to four firms against utterly inadequate securities, to the enormous sum of nearly £6,000,000. The directors and the manager were tried for and convicted of tampering with the reports, and sentenced to imprisonment. It has been arranged to wind up the bank by liquidation, and it is feared that the calls to be made upon the share-holders will involve nearly every one of them in utter ruin. In consequence of £400 of the stock being held by the Caledonian bank in security of an advance, it has had temporarily to suspend payment.

In consequence of allowing interest on deposits, the banks in Scotland may be said to hold the whole capital of the country, minus only the money passing from hand to hand. This wide-spread system of depositing is greatly aided by the establishment of branches from the parent-banks; and these branches are found in every small town in the kingdom. The entire number of branch-banks in Scotland in 1879 was about 850. At these branch-banks, the agent (usually a respectable person in business) discounts bills within certain limits, issues letters of credit, and pays out notes, and also gives cash on demand for them; though, strictly, the notes of a bank are only payable on demand at the head-office. By a strict system of supervision, Scottish branch-banks are usually well conducted, and are of great service in every department of trade. For one thing, they have powerfully contributed to extinguish burglary and highway robbery, as no one thinks of keeping money, except to a trifling amount, either in his house or about his person. At all the great fairs, bankers attend to receive deposits, and to pay checks. Forgeries of Scottish bank-notes are now unknown.

The banks in Scotland, like the banks in Ireland, but unlike the provincial banks in England, are allowed to issue notes beyond their fixed issues, on holding gold equal in amount to the extra issue. But as the gold thus retained is, like the other gold in reserve, liable for all the deposits, as well as for the whole circulation of a bank, if it should fail, the security of the establishment is increased only in a small degree by this arrangement, which, apart from the loss of profit to the bank on the gold unemployed, is attended with inconvenience at those seasons when the circulation is extended. In Scotland, and Ireland also, banks can issue one-pound notes; the English banks are not permitted to circulate notes of less value than £5.

Besides employing money in discounting bills, the Scottish banks grant loans of fluctuating amount, called *cash-accounts* or *cash-credits*. By a cash-account is signified a process whereby an individual is entitled to draw out sums as required, to a stipulated amount, and by an implied condition to make deposits at his convenience towards the liquidation of the same. On entering into this arrangement, he finds security to the bank that he will repay to the bank, whenever called on, the balance of sums drawn out, less those paid in, with the interest that may be due. These accounts are balanced yearly, like current or deposit accounts. The only difference between the latter and a cash-account on the face of them is, that if the credit allowed on the cash-account is being made use of, the balance is in favor of the bank; whereas, on the other kind of accounts, the balance is in favor of the bank's customer.

Banks in Ireland.—There are nine joint-stock banks, having 448 branches and sub-branches. Their authorized issue is £6,354,494; of which £3,738,428 is that of the bank of Ireland. It is a national bank, lending £2,630,769 of its capital to government. It was established in 1783, with privileges resembling those of the bank of England. Its capital is £2,769,230, and its rest £1,034,000. The capitals of the other banks vary from £250,000 to £1,500,000, and the total capital of the joint stock banks in Ireland is £6,809,-230. Six are banks of issue. The amount of deposits in the joint stock banks in Ireland in 1878 was £31,745,000; in 1868 it was only £22,163,599. Interest is allowed on money deposited for a stated period, but not money at call, or as a rule on current accounts. There are also three private banking firms in Dublin.

Foreign and Colonial Banks.—On the continent of Europe, there are both national or incorporated banks and private banks. The national banks are, to a greater or lesser extent, government establishments, managing the public debt and finances, and, unlike the bank of England, subject to government influence or interference. In India and the British colonies, there are joint-stock banks and private bankers. The joint-stock banks of Australia are establishments of magnitude. The United States of America are overrun with banks. Insufficient capital, reckless management, and the smallness of the reserve kept, have frequently led to the suspension of payments of these banks. At all times the number of forgeries of bank-notes in the United States is very considerable, and great caution requires to be exercised in accepting notes as payment.

BANK—BANKING (*ante*). The main principles of banking in the United States agree generally with those in other business countries, with such exceptions as are involved in the present system of national banks. Indeed, the modern English system of B. originated in the United States, while they were English colonies. As early as 1690 the colony of Massachusetts issued bills of credit to a considerable amount, making the paper legal tender for taxes and other debts, the notes being payable to bearer on demand. This was five years before the establishment of the B. of England (opened Jan. 1, 1695), and William Patterson, the father of that remarkable fiscal agency, had been in the colonies, and took especial interest in the Massachusetts experiment. In the exigencies of the campaign against the French in Nova Scotia, in 1745, Massachusetts again issued paper currency; and when England paid nearly $200,000 for the cost of that expedition, the colony redeemed her paper at the rate of $11 currency for $1 of silver. Other colonies issued legal tender, and about the time of this redemption the paper of some of them was rated per dollar par, as follows: New England provinces, 11 for 1; North Carolina, 10 for 1; South Carolina, 7 for 1; New York, 2 for 1; Pennsylvania, 1.80 for 1. In 1712, South Carolina set up a bank, and issued nearly $250,000 in bills, to be retired at the rate of one twelfth annually until all were redeemed. This provision increased their value in the first year or two about 100 per cent. In 1723, Pennsylvania began by an issue of $75,000, and half a century later doubled the amount. In 1739, Massachusetts established a regular bank which issued bills of credit.

The revolution had to be provided for by extraordinary means; in May, 1775, the continental congress authorized the issue of bills to the amount of $3,000,000, making them legal tender. Within two years this currency began rapidly to depreciate, under constantly increasing issues, which, in 1779, had reached $160,000,000. Congress then directed the issue of an additional $40,000,000, and declared that to be the final extent. Though this promise was kept, the depreciation continued, and by 1781 continental currency was good for nothing as money. Some years after the foundation of the present national government, the old currency was redeemed, at the rate of about 100 to 1. On the last day of the year 1781, congress chartered the bank of North America in Philadelphia, and both Pennsylvania and New York also granted charters to the same concern the next year, though it did not go into operation for nearly two years. The bank of New York was chartered in 1784, and the bank of Massachusetts, at Boston, in the same year. But these institutions were unable to supply the currency required, and other states began to issue bills of credit, or to charter banks, and in some, personal property of certain kinds was made legal tender for ordinary debts. But all further issues by states, as such, were forbidden by the federal constitution, which went into operation in Mar., 1789. Then, among the early movements in congress, came a charter for a bank of the United States, which was carried after a long contest. The charter ran 20 years from Feb. 25, 1791; capital, $10,000,000, of which the United States government took $2,000,000, thereby having a share of the directors; and its bills were made good for the liquidation

of all debts to the government. When the time came for renewing the charter, the country was at war with England; there were nearly 90 state banks to oppose the rechartering, and the effort failed. The old bank failing also to get a state charter, immediately wound up its affairs. It had been successful and had paid 8 to 10 per cent a year to its stockholders. State banks increased, and in 1813 there were 150 of them, with circulating notes amounting to $62,000,000. In 1814, the New England banks suspended specie payments, but resumed at the beginning of 1817. Meantime, state bank notes were depreciating. In 1814, those of Baltimore were down 20 per cent, and those of New York, 10 per cent. The news of peace raised their value 5 and 10 per cent; but they were subject to sudden fluctuations; the federal government had no control over the states, and the states had little over the bankers. The old "regulator" was seriously missed, and, April 3, 1816, congress chartered the second United States bank at Philadelphia, with power to establish branches. Its capital was $35,000,000, of which the federal government took $7,000,000; the bank with its branches was made the official depositary of government money; its bills were legal tenders, and it was the agent for negotiating federal and state loans. This compelled the state banks to resume specie payments, and business again moved forward steadily. State banks, however, grew in number rapidly. In 1816, there were 246, with $90,000,000 capital. In 1830, when the rechartering of the United States bank was proposed, there were 330 state banks, with $145,000,000 capital. President Jackson in his message, Dec., 1829, expressed his opposition to the United States bank, and his expected veto of the bill to renew the charter came in July, 1832. The next move was to remove the deposits of public money from the bank. This could be done only by order of the secretary of the treasury, and as that officer refused to conform to the president's wishes, he was summarily removed, and a more tractable man was appointed in his place. The old bank, that had more than once saved the credit of the nation, was crippled, and went down. In the wind-up it was found that its whole capital was lost, though it managed to pay its debts. Its last operations were under a charter from the state of Pennsylvania.

The refusal to continue the national bank gave full scope to state institutions, and they grew with mushroom rapidity. In 1837, there were 634 of them, with a capital of $291,000,000, $149,000,000 in circulating notes, $127,000,000 in deposits, and $525,000,000 in loans and discounts. The crash surely impending was hastened by an enormous crop of cotton in 1836, a consequent decline in prices, and the depreciation of the credit of cotton dealers and their backers. The tumble began in 1837, and by the 1st of June there was an entire suspension of specie payments; values fell from dollars to shillings, all business was deranged, millions of people were reduced from comparative ease to sharp poverty, and a period of wretchedness began which continued nearly five years. However, congress passed a general bankruptcy law, the states assisted, by limitation and other laws, and by 1843–44 the country had nearly recovered. The banks had many trials; some resumed, only to suspend again, and many went into liquidation. Congress passed the independent treasury law, and thereafter the federal government had no direct concern in banking until the rebellion broke out. The old United States bank had its final downfall in the crash of 1837. That crisis taught wisdom to the state banks, and a general retrenchment was the consequence. Between 1838 and 1842, the number of banks was reduced from 675 to 577; capital from $317,000,000 to $229,000,000; circulation from $116,000,000 to $59,000,000; and discounts from $486,000,000 to $254,000,000. Further security was demanded by the public, and among the new measures were the Suffolk bank plan in Massachusetts, and the New York safety-fund system. The Suffolk bank plan was merely an arrangement whereby that bank was made the channel through which all notes of New England banks that found their way to Boston, as most of them naturally did, were at once forwarded to the issuers for redemption. The result was that all solid bankers found it for their interest to deposit with the Suffolk a redemption fund, as that insured the acceptance of their notes.

The New York safety-fund system, which is the cardinal principle of the present national banking plan, required each bank to deposit, with the banking department of the state, securities consisting of federal or state stocks, or bonds and mortgages, which, in case of the failure of the bank, were sold, and the proceeds applied to the liquidation of its debts. In 1857, there was another crash, followed by a general suspension of specie payments; but the depression did not long continue.

Some of the serious evils, avoided to a great extent by the issue of greenbacks and national bank-currency, were counterfeited or altered bills. When almost every bank had its own plates for six or more denominations of notes, the land was full of counterfeits and alterations, and no business man ventured to accept a bank-note not well known to him, without previous comparison with a detector. In 1862, there were counterfeits on the notes of 253 banks, besides 1861 bills imitated, and 1685 entirely spurious notes. On the best notes there was a discount in the business centers of from 1 to 10 or even 15 per cent; and exchange was more variable than the weather. The "wild-cat" and "red-dog" banks of Michigan, and other western states, were notoriously unsafe. A dozen of them would club together to make a show for one only, when the examiner came along, and the same specie would be an hour in advance of him all along his route. The "red-dog" bank was so-called because of its movable nature, and of the color stamped on its notes. Established in one place on Monday, the "banker" might pack his carpet-bag

at night, and on Tuesday open his bank 50 miles away; in which case he stamped in red ink on the face of his notes the name of the place in which the "banking-house" was last established.

The war of the rebellion made large issues of credit necessary, and among the earliest financial measures was a tax on banking, with certain inducements intended to float government loans by means of banks, and the establishment of the national banking system. The measures were successful, and the state institutions rapidly came into the new system, so that in the beginning of 1866 nearly 1600 of them had become nationalized. When the war began in 1861, the paper in circulation in the country was $200,000,000, of which about three fourths was the issue of loyal states. The specie available for circulation was estimated at $275,000,000. The government soon borrowed from the associated banks in the large cities $50,000,000, for which demand notes were issued, that were not at the time legal tender. In Feb., 1862, congress authorized the issue of $150,000,000 in notes, of which $50,000,000 was for the withdrawal of the demand notes. The last issue was legal tender, except for duties on imports and interest on the public debt. The banking law of Feb. 25, 1863, still in force, created a currency bureau in the treasury department, at the head of which is the comptroller of the currency, who has power to authorize banking by associations of not less than five persons, and a minimum capital (unless in very small places), of $100,000, one half to be paid at once, and the remainder in six months. Before commencing business, the association must transfer to the treasury of the United States interest-bearing bonds of the national government to the amount of one third the capital; whereupon they may receive circulating notes, registered and countersigned, equal to 90 per cent of the market value of the stocks deposited, but not beyond the amount of their par value. The entire amount of currency to be issued is limited to $300,000,000, one half to be apportioned among the states according to their representative population, and the other half with regard to the existing banking capital, resources, and business of the several states. Nearly all the states conformed to this national system, withdrew their old notes, and took new ones from the treasury. The currency then came to consist of the notes of these banks, and the treasury demand notes, or "greenbacks," the whole amounting in 1865 to nearly $450,000,000. The national notes are quite as good as the demand notes, and circulate as freely, their final payment being assured by deposits in the treasury department.

Of course this flood of paper soon drove specie out of circulation, and little was seen of gold and silver, except at the custom houses and sub-treasuries, until the general resumption, Jan. 1. 1879. In the meantime there came another financial crisis, in the autumn of 1873, precipitated by the failure of the important house of Jay Cooke & Co.; but there were no specie payments to be suspended, and the holders of national bank notes were amply protected by the treasury deposits. Still there was great financial distress for five years, gradually relaxing in 1878–79, with recovery fully established towards the close of the latter year.

Of the national banking system, it may be said that the rebellion presented to congress as its first duty the invention of some plan for repressing the heterogeneous system of banking, providing one system of a homogeneous and absolutely safe character; one which would be truly national, operating alike in every part of the United States. The necessities of the government inspired the new order, but the old was rapidly failing to meet the wants of the people; the new, therefore, may be said to have grown out of the necessities of business as well as the straits of the nation. The new system preserved all the advantages of the old, and added many new ones. It gave absolute protection to the holders of the national bank-notes, as government bonds were deposited with the U. S. treasurer in ten per cent excess of their issue for the security of their redemption. It provided security of a uniform and almost absolute character for the deposits, making the stockholder liable, in an equal amount of his stock interest, for the ultimate payment of the deposits. It provided for a uniform bank-note of equal value in every part of the country, so engraved and issued, that security against counterfeits was far better attained than ever before. It provided for a system of redemption which made exchange merely nominal, and gave to national bank-notes, issued in most distant places, a uniform value in all the great financial centers of the country. It provided a system of published reports over the sworn signatures of the executive officers of the banks, and a uniform system of examination under the direction of the comptroller of the currency.

The national banks are required to pay to the revenues of the general government as follows: 1. One half of one per cent, semi-annually, on the circulation allowed by law. 2. One quarter of one per cent, semi-annually, on the average deposits for the half year. 3. One quarter of one per cent, semi-annually, on capital not in government bonds. Their stockholders are subject to local taxation on the market value of their stock as personal property. Each bank must keep with the treasurer of the United States, in legal tender notes, for the redemption of its bills, five per cent of the amount of its circulation; and must retain constantly in its own vaults two fifths of fifteen per cent of its deposits.

The distribution and extent of banks and banking in the United States is shown in the following table, prepared by the comptroller of the currency:

NATIONAL BANK CIRCULATION AUTHORIZED AND ISSUED.

Statement showing by geographical divisions the amount of CIRCULATING NOTES *to which the National Banks in operation on June* 14, 1879, WERE ENTITLED, *and also the amount of notes which had been* ACTUALLY *issued to them.*

The antiquity of banks is very great. In Europe, the bank of Venice, the earliest on record, started in 1171; the bank of Barcelona, in 1401; of Genoa, in 1407; and of Amsterdam, in 1609. But in the metropolitan museum of art in New York are Babylonian tablets bearing distinct records of transactions in banking that took place in the reign of Nebuchadnezzar. The earliest tablet is of the year 601 B.C. On it are memoranda of loans of silver made by Kudurru as follows:—1 mina of silver to Suta, 1 mina to Balludh, ⅓ mina to Beluepus, 5 shekels to Nabu-basa-napsati, and 5 shekels to Nergal-dann. Total, 3 minas, 5 shekels of silver. No. 2, dated at Babylon on the 12th day of the month of Sivan, in the 8th year of the reign of Nebuchadnezzar, 597 B.C., bears tabletary evidence, attested by three witnesses, of the loan of 2 minas, 10 shekels of silver, made by Nabu-suma-esir, son of Belu- * * * -ilani, son of the * * *, to Kudurru, son of Basa, son of Egibi. No. 3, dated at Babylon, month Tisri, 25th day, 8th year of Nebuchadnezzar, 597 B.C.—Loan of ⅔ of a mina, and 4 shekels of silver, granted by Belu-balish, son of Musgul, son of Epes-ili, to Kudurru, son of Basa, son of Egibi. To be repaid on the 10th of the month of Kislev. There are four witnesses. No. 4, dated at Babylon, month of Tebet, 6th day, 22d year of Nebuchadnezzar, 583 B.C., records the sale of 9 measures of corn, or the promise to sell 9 measures of corn, by Belu-basa, son of Zira-yuquin, son of Munnabitti, to Suta, son of Kudurru, son of Egibi. Three witnesses. No. 5, dated Babylon, month Ab, 21st day, 31st year of Nebuchadnezzar, 574 B.C., refers to the payment of 24 measures of corn, and 56 shekels of silver, by Kasir and Iddin-Marduku, sons of Basa, son of Nur-Sini, to Belu-nasi, son of Suzabu, son of Beludini. No. 6 is dated at Satkrini, 25th Sivan, 37th year of Nebuchadnezzar, 568 B.C. No. 7 is dated at Babylon, 12th Adar, 42d year of Nebuchadnezzar, 563 B.C. Nos. 8 and 9 are dated at Babylon, in the 2d and 3d years of the reign of Neriglissar, 558 and 557 B.C. Nos. 10, 11, 12, 13, 14, 15, and 16, are dated at Babylon, two in the 2d, one in the 4th, three in the 6th, and one in the 11th (?) year of Nabonidus, ranging, therefore, from 554 to 545 B.C. No. 17 is dated at Borsippa, in the 7th year of Nabonidus, 548 B.C. Nos. 18 to 30 date from the 8th to the 16th year of Nabonidus, 548 to 540 B.C. Nos. 31 and 32 are dated at Babylon in the 3d and 7th years of Cyrus, 534 and 530 B.C. No. 33 is dated at Lakkarrinu, and Nos. 34 and 35 at Babylon, the first in the 2d and the two others in the 6th year of Cambyses, 528 and 524 B.C. No. 36 is dated at Kharsak-Kalama, 25 Kislev, 1st year of Darius, 518 B.C. Nos. 38 to 43 date from Babylon and range from the 3d to the 26th year of Darius, 516 to 493 B.C. An interesting tablet is No. 44, which, dated at the city of Dhabi-Belu, 15th Nisan, 40th year of Nebuchadnezzar, 565 B.C., records 7 shekels of silver lent by Gimillu, son of Samsa-zira-ibni, son of Sinu-satnu, to Nabu-suma-iddin, son of Belu-balidh, son of Sakdidi, and Iddin-Marduku, son of Barsa, son of Nur-sini, in the course of the month Nisan * * * * by 1 shekel 5 times, give (back); 3 witnesses. Gimillu receives therefore 3 shekels interest. No. 45 bears an undated contract; No. 46, memoranda of loans, expenditures, etc. (undated); No. 47, also undated, similar contents; No. 48, an account of the produce of certain lands in the 14th year of Darius, with names of buyers and amounts; No. 49, an undated account of field produce, and No. 50, rough memoranda. No. 51 is dated at Babylon on the 18th day of the 14th year of Darius, 505 B.C. M. Lenormant divides these most interesting documents into five principal types: 1. Simple obligations. 2. Obligations with a penal clause in case of non-fulfillment. One he gives which had 79 days to run. 3. Obligations with the guarantee to a third party. 4. Obligations payable to a third person. 5. Drafts drawn upon one place, payable in another. He gives the following illustration of one of these letters of credit. "Four minas 15 shekels of silver (credit) of Ardu-Mana, son of Yakin, upon Mardukabalussur, son of Mardukbalatirib, in the town of Orchoe. Mardukbalatirib will pay in the month of Tibet 4 minas 15 shekels of silver to Belabaliddin, son of Sennaid. Our, the 14 arakhsamna in the 2d year of Nabonidus, king of Babylon." Then follow the names of witnesses. These Assyrian drafts were negotiable, but from the nature of things could not pass by indorsement, because, when the clay was once baked, nothing new could be added, and under these circumstances the name of the payee was frequently omitted. It seems to follow that they must have been regularly advised. It is remarkable that such instruments, and especially letters of credit, should have preceded the use of coins. The earliest banking firm of which we have any account is said to be that of Egibi & Co., for our knowledge of whom we are indebted to Mr. Boscawen, Mr. Pinches, and Mr. Hilton Price. Several documents and records belonging to this family are in the British museum. They are on clay tablets, and were discovered in an earthenware jar found in the neighborhood of Hillah, a few miles from Babylon. The house is said to have acted as a sort of national bank of Babylon; the founder of the house, Egibi, probably lived in the reign of Sennacherib, about 700 B.C. This family has been traced during a century and a half, and through five generations down to the reign of Darius.

BANK-NOTES, MANUFACTURE OF. The chief object in the manufacture of bank-notes is to render forgery impossible, or at least easy of detection. This is sought to be effected by peculiarity of paper, design, and printing, or by a combination of these means. See PAPER. The main reliance has been on mechanical design—the writing, the emblems, and the ornaments being so combined as to render forgery difficult. The ink, too, is peculiar (see INK), being the blackest and most indelible of inks. As a further security against forgery, a self-registering machine was contrived by Messrs. Oldham. Copper-

plate printing was the only printing in use for bank-notes till 1837, when a great improvement was made by Messrs. Perkins & Heath. This was the reproduction of designs by the mill and die by mechanical pressure. The pattern is engraved on a soft steel plate, which is then hardened, to transfer the pattern by pressure to a soft steel roller, on which, of course, the pattern is produced in relief; the roller or mill is then hardened, to reproduce the pattern in the plate from which the printing is to be done; and thus almost any number of plates for all common purposes can easily be produced. No bank of England notes are issued twice.

This system of siderography continued in use for bank-note printing in the bank of England till 1855, when electrotype-printing was introduced by Mr. Smee, with the assistance of the mechanical officials (see ELECTROTYPING); and since that time the notes of the bank of England have been all produced by surface-printing by the electrotype.

The usual production of notes equals a value of about £24,000,000 per week; it being the policy of the bank to renew the notes before the paper loses that peculiar crispness which distinguishes it from all other paper, and is a safeguard against forgery.

There are seventy or eighty kinds of bank of England notes, differing in their denominations or values, but similar in the mode of printing. The paper is expressly made for the purpose, by one firm only, and is remarkable for its strength, lightness, and difficulty of imitation. The bank of Ireland notes are printed on the copperplate plan, not by surface-printing; but the use of delicate mechanism enables this to be done with great accuracy and celerity; the bank of France notes are produced from plates, the result of photography, electrotyping, and steel-plate printing. Zincography and lithography are employed by some banks; and also *acierage*, a mode of hardening copper electrotypes with a thin surface of steel.

BANK-NOTES, MANUFACTURE OF (*ante*). The bank-notes of the United States are now manufactured by the government in the treasury department at Washington. The processes of this manufacture are briefly described as follows: The design of the note, including all the lettering and devices thereof, upon a sheet of the required form, being in the hands of the workmen, they first proceed to make the die. A plate of soft, highly polished steel is selected, and upon it is sketched the design, or such portions of it as are of the same color, if more than one tint is to be used in printing. A separate die is needed for every shade used. This is then carefully engraved. It will be understood that, unlike the method of wood engraving, the lines which take the ink are cut into the plate instead of being raised above its surface. The engraver is limited to such parts of the work as can be done by hand; other portions, such as the scrolls and elaborate tracery, are done entirely by machinery. The principal apparatus used is a complicated piece of mechanism, which actuates a plate to which the steel for the die is attached and caused to press against a diamond point. Perfectly true and delicate lines are thus cut into the metal, making figures technically termed "cycloid rosettes." The machine, in theory, somewhat resembles a kaleidoscope, as it requires to be set by accurate pointers and dials to some special figure, which, when the combination is changed, can never be reproduced. One of these instruments is in use, and its work, together with that of the geometrical lathes, can be readily recognized on the national currency.

The die being complete, is ready for the transfer process. Postage stamps, for instance, are made in sheets of two hundred, so that the die must be transferred that number of times on a single plate. It is first case-hardened and then put, face up, in a press which is made with a combination of levers actuated by the foot, so as to give the tremendous pressure of twenty-one tons on a single line. A cylinder or "roll" of soft steel is, by careful gauging, placed so as to rest directly over the face of the die, and, at the same time, is so arranged as to revolve easily along its surface even when under the full weight. The pressure is then applied, with the result of forcing the soft steel of the roll into the lines of the engraving, so that when complete, the periphery of the cylinder shows an exact reproduction of the face of the die, only the lines sunk on the die are now raised on the roll. Next, the cylinder is case-hardened. Then the plate—soft steel again—to be used for the final printing is placed in the press and the roll is arranged above it. Now the cylinder leaves its impression on the plate, the hard steel of the raised lines cutting deep into the surface, so that a precise duplicate of the original die is obtained. This is repeated as many times as there are to be repetitions of the stamp or note on the single plate, which is then ready for use.

The ink for printing is made on the spot. In a large room are ten or a dozen paint mills, which are busily grinding the colors and oil together. Two large ones are filled with green ink, another with vermilion, while others are making blue, red, and other tinted inks. Nothing but the finest color and the best boiled linseed oil is here used. We now pass to the paper room, where the paper is received directly from the government, cut in sheets of the required form. The fractional currency and larger notes are made of a peculiar material containing colored fibers. The paper for postage stamps is made of the best linen. It is of short fiber, very fine, and extremely strong. The sheets on which currency is to be printed are counted as soon as received, and the result reported for verification. They are placed in heaps, marked off in sets of 100 and 1000. When issued for printing, the workman receiving them has to present an order signed by the superintendent. They are then charged against him in his pass-book, when he carries them away to be damped, by simply wrapping them in wet cloths. The presses

used are simply cylinders moved by long-handled levers, and are each attended by three men and a girl. The plate rests upon a small iron box warmed underneath by gas flames. A workman using a plate-printer's roller rapidly covers the plate with ink and passes it to another operative at his side, who wipes it with a soft cotton cloth, and then polishes with the palm of his hand covered with whiting, thus removing the ink from its surface, but not from the engraved lines which remain filled. This done, the plate is placed, face up, in the press. The girl stands ready with a sheet of damp paper which she carefully lays upon the plate. The pressman turns the levers, the cylinder revolves, the plate passes under it, and the paper is removed bearing a perfect impression. As soon as a printer has completed the work assigned to him, he hands it, made up in "books" of 100 impressions, each sheet inclosed between two others of brown paper, to a clerk. He is then credited with his delivery, spoiled sheets being counted the same as perfect ones, so that if his return is correct his debit account on his passbook, which is kept in a different apartment and by other employés, is thus balanced. The finished impressions are now carefully counted and inspected. The spoiled ones are removed and sent to the proper agents to be burnt, while the others are hung in the drying room. This apartment is heated by steam-pipes, and the paper is suspended by wires, for a day or two, until perfectly dry. Then the brown paper is removed, and the sheets, packed between leaves of press board, are subjected to the action of a powerful hydraulic press. They are then once more inspected and counted.

BANKRUPTCY. See INSOLVENCY.

BANKS, a co. in n.e. Georgia, on Broad river; 250 sq.m.; pop. '80, 7,337—9,140 colored. Productions, wheat, corn, cotton, and sweet potatoes. Co. seat Homer.

BANKS, in navigation, are elevations of the bottom of the sea; when tolerably smooth at the top, they constitute *shallows, shoals,* and *flats;* but when rocky, they become *reefs, ridges, keys,* etc. Pilots and captains of ships require to be intimately acquainted with the B. along their route; and a chart, if properly prepared, always defines them by means of small dots, if sands, and small crosses, if rocky. In war-time, small vessels often escape capture by running into shallows where larger vessels dare not follow them. The Newfoundland and the Bahama B. are well-known examples of this kind of sea-bottom.

BANKS, Sir JOSEPH, a zealous naturalist, was b., according to some accounts, at Revesby Abbey, in Lincolnshire, according too thers, in London, in Jan., 1743, and d. June 19, 1820. He was descended from a family of Swedish origin, which had been settled in England for about 200 years. To this family belongs also John Banks, who made his name known as a writer of tragedies, in the latter half of the 17th century. B. was educated at Eton and Oxford. In 1763, he made a voyage to Newfoundland and Labrador, collecting plants; and from 1768 to 1771, he sailed with Cook round the world in the capacity of naturalist, and wrote the botanical descriptions for the first voyages. In the year 1772, he visited the Hebrides and Iceland, whence he brought back a rich treasure of specimens for his studies in natural history. Before this voyage, Staffa was hardly known beyond its immediate vicinity. It was carefully examined by B., and through him its wonders were made known to the public. In 1777, he was elected president of the royal society, an office which he held for 42 years; and in 1781 he was created a baronet. He deserves particular credit for founding and managing the African association; and the colony of Botany bay owed its origin mainly to him. Through his efforts, the bread-fruit tree was transferred from Otaheite to the West Indies, and the mango from Bengal, as well as many of the fruits of Ceylon and Persia. Many naturalists and travelers—Blumenthal, Hornemann, Burckhardt, Mungo Park, and others—were indebted to him for zealous and disinterested assistance in their labors. During the French war, B. did much to alleviate the sufferings of all captive men of science, and used his influence with government to procure the restoration of their papers. Cuvier, in his *éloge* on him before the French academy of science, states that no less than ten times had collections, captured by the English, been restored to the Jardin du Roi at Paris through the instrumentality of Banks. No man of science appealed to him in vain for pecuniary assistance; and his splendid library of natural history was at the service of those who desired to consult it. With the exception of articles in magazines, and contributions to the publications of learned societies, especially to the *Philosophical Transactions,* B. has written nothing but two small works—*A Short Account of the Causes of the Diseases in Corn called Blight, Mildew, and Rust,* which was printed for his friends in 1803, and for the public in 1805; and *Circumstances Relative to Merino Sheep* (London, 1809). He left a valuable library, of which an excellent catalogue was made by his friend Dryander; and a rich collection of specimens in natural history, both of which he bequeathed to the British museum.

BANKS, SAVINGS. See SAVINGS-BANKS.

BANKS, THOMAS, an eminent English sculptor, b. in Lambeth in Dec., 1735. B. was apprenticed to a landscape gardener and architect, but he soon abandoned these practical arts for the more imaginative one of sculpture. In 1770, B. was a successful candidate for the gold prize of the royal academy, established two years before. In 1772, with an allowance of £50 a year from the academy for three years, he went to Rome to

study the masterpieces of art there. After a residence of several years in Rome, during which he exhibited two of his finest works, "Caractacus Pleading before Claudius," and "Psyche and the Butterfly," and having gained much fame but little profit, he returned to England. Here his refined imaginative style was little appreciated in comparison with the popular but inferior performances of some of his contemporaries; and after two years, he went to Russia, where he was well received by the empress Catharine, who purchased his Psyche, and gave him a commission for a group called "Armed Neutrality." Having executed this, he returned to England, where he completed perhaps his finest work, "The Mourning Achilles," now in the British institution. B. now received several commissions, and was elected a member of the royal academy. The monuments of Sir Eyre Coote in Westminster abbey, and of captains Burgess and Westcott in St. Paul's cathedral, were among his last works. He died Feb. 2, 1805. It was in purely imaginative works that B. most excelled; in practical subjects, his introduction of the ideal was incongruous and inartistic, rendering them far less valuable than those of some of his rivals.

BANKS, NATHANIEL PRENTISS, b. Mass., 1816, a statesman and general. He learned the trade of a machinist, studying in leisure hours; edited a newspaper in Waltham, and another in Lowell, was admitted to the bar; elected to the legislature in 1849, and made speaker in 1851. In 1852, he was chosen a member of congress. In 1853, he was president of the convention to revise the constitution of the state; in 1854, re-elected to congress, and chosen speaker of the house of representatives after the longest contest ever known (congress met Dec. 3, 1855, and the speaker was not elected until the 133d ballot, Feb. 2, 1856), he was again chosen to congress in 1856; and governor of Massachusetts 1857–59. He was commissioned maj.-gen. in the civil war, and was in active service until its close. After the war he was chosen and re-chosen to congress, until 1872.

BANKSIA, a genus of Australian shrubs of the natural order *proteaceæ* (q.v.), named in honor of Sir Joseph Banks. A few of the species become small trees. They have hard dry leaves, generally white or very pale green beneath, and present a remarkable appearance from the umbellate arrangement of their branches, which bear towards their extremities oblong heads of very numerous flowers. The flowers secrete much honey. Some of the species are now frequent ornaments of greenhouses in Britain. They are abundant in all parts of Australia, forming, indeed, a characteristic feature of its vegetation, and are called honeysuckle trees. *B. grandis*, found at Swan river, exceeds all the rest of the genus in size, attaining a height of 50 feet.

BANKSIA, several genera of plants named after Sir Joseph Banks, but only one properly so—one of the family of proteaceæ, named B., by Linnæus. They are natives of Australia, of conspicuous and beautiful forms, with broad hard leaves, which closely cover the branches; flower and fruit in cones, the flowers projecting in spikes.

BANKS LAND, an island in the Arctic ocean, 70 m. to the s.w. of Melville island. It is intersected by the parallel of 74° n., and by the meridian of 116° west.

BANN, the name of two rivers in the n.e. of Ireland; the one, the upper B., flowing into, and the other, the lower B., out of Loch Neagh. The upper B. rises on the n. side of the Mourne mountains, in the s. of Downshire, and runs 25 m. n.n.w. through the counties of Down and Armagh, successively in a granite, silurian, trap, and tertiary basin, into the s. side of Lough Neagh. It passes Banbridge, Gilford, and Portadown. At the latter place the Newry canal joins it. The lower B., strictly the continuation of the upper, issues from the n.w. corner of Lough Neagh, and flows 40 m. n.n.w., through Lough Beg, and dividing the counties of Antrim and Londonderry. It runs past Portglenone and Coleraine, into the Atlantic ocean 4 m. s.w. of Portrush. One m. above Coleraine it falls over a ledge of rock 13 ft. high. It bears the surplus waters of Lough Neagh to the ocean, and has important salmon and eel-fisheries. Vessels of 200 tons can reach Coleraine by the river, 4 m. from the ocean.

BANNACKS, BONNACKS, or PAUNAQUES, an Indian tribe of the Shoshone family, frequenting the Yellowstone region, and the territory between the Rocky mountains and the Sierra Nevada; about 1,000 in number; usually friendly to the whites. The B. are brave and proud, and the men are usually good looking. They speak a dialect of Shoshone.

BANNATYNE CLUB, a literary club deriving its name from George Bannatyne, to whose industry we are indebted for the preservation of much of the Scottish poetry of the 15th and 16th centuries. The B. C. was instituted in Edinburgh in 1823 by Sir Walter Scott, with the assistance chiefly of Mr. David Laing of the Signet library, Mr. Archibald Constable, and Mr. Thomas Thomson. The object of the institution was to print rare works illustrative of Scottish history, topography, poetry, miscellaneous literature, etc., in a uniform and handsome manner, either at the expense of the club, or as the contributions of individual members. As a general rule, the number of copies of each work printed was limited to the number required for distribution among members, but in some instances a few were printed for sale. The club originally consisted of 31 members only, who paid an annual contribution of five guineas; but, owing to the anxiety of many eminent men to become members, the number was gradually extended to 100, where it was definitively fixed, the same annual payment being still required. Its first president

was Sir Walter Scott, who was succeeded by Mr. Thomas Thomson, and lords Cockburn and Rutherfurd; and its first secretary was Mr. David Laing, who continued to its close to discharge the duties of the office. The club had annual meetings in Dec., which were of a very convivial character, so far as can be judged from an account of their first meeting published in the *Edinburgh Literary Gazette* of Feb., 1834—afterwards reprinted by the club itself—which suggestively says that the *Bannatyne Garland*, No. 1, a song composed by one of the members, was sung "to the tune of *Four Bottles more.*" These meetings, however, were given up, and the club itself, which, in 1859, numbered about 80 members, was finally dissolved on the 27th Feb., 1861. Since its commencement it numbered among its members many of the most distinguished Scotsmen, and printed 116 works, some valuable as they are rare, and all bringing high prices at sales.

BANNEKER, BENJAMIN, 1731–1806, a negro mathematician, a native of Maryland. His grandmother, a white woman, taught him reading and writing, and after his 50th year he began to study mathematics with special reference to astronomy. In 1792, he issued an almanac of his own making, and continued the series annually throughout his life. He assisted in fixing the boundary lines of the district of Columbia.

BANNER, a piece of cloth attached to a pole and usually bearing some warlike or heraldic device or national emblem. In this sense B. is a generic term, incuding many species, such as standard, ensign, pennon, flag, etc. Banners have been used from the earliest times and in all countries for the purpose of directing the movements of troops. We read of them constantly in the Old Testament, as in Numbers ii. 2: "Every man of the children of Israel shall camp by his standard, and under the ensign of his father's house." The earliest Roman standard was a bundle of straw fixed to the top of a spear. This was succeeded by figures of animals—the horse, the boar, etc., all of which soon gave place to the eagle, which continued all along to be the chief Roman ensign, and was afterwards assumed by the German and latterly by the French emperors of the Napoleon dynasty. In addition to the eagle each Roman cohort had a B., generally a serpent or dragon woven on a square piece of cloth. The standard of the cavalry was a square piece of cloth expanded on a cross, and it was to this that the term *vexillum* properly applied. Examples of these standards are sculptured on the arch of Constantine at Rome. The top of the staff was also frequently adorned with a figure of Mars or of Victory, and in later times with the head of the reigning emperor. After Constantine embraced Christianity, the cross was substituted for the head of the emperor on the purple B. of Byzantium. Standards were less in use amongst the Greeks than has been usual with warlike nations; but a standard, and sometimes a scarlet flag, was employed as a signal for giving battle. On the rise of chivalry in the middle ages, the ordering of banners, like every other branch of military organization, attained to something like scientific exactitude. From the B.-royal, which bore the national emblems, to the small streamer attached to the lance, with its cross or stripes, there was a regular subordination, each emblem having its place and its meaning. The pennon of the simple knight differed from the square B. of the banneret (q.v.), it being pointed at the ends. In addition to their varieties in size, shape, and color, these banners were distinguished by the emblems which they bore. One of the earliest is the Danish raven, depicted on the standard taken by Alfred, of which Asser mentions the tradition, that "in every battle, wherever that flag went before them, if they (the Danes) were to gain a victory, a live crow would appear flying on the middle of the flag; but if they were doomed to be defeated, it would hang down motionless." Nor did the privilege of carrying banners belong to princes and knights alone; bishops and abbots displayed similar ensigns, which were carried before them in religious processions and under which their retainers fought in their defense. It was to these that the term "Gonfalon," a word as to the origin of which much diversity of opinion exists, was more commonly applied. In place of the heraldic emblems of the knight, the B. of the church and of towns and communes usually bore the effigies of saints. Some banners, however, displayed no ensigns whatever and were known simply by their color. Of this the *oriflamme*, or plain ruddy flag of St. Denis, was a famous example. The celebrated Bayeux tapestry (q.v.) throws considerable light on banners, as well as on other matters connected with the warlike arrangements of the middle ages. Much curious information on this and kindred subjects will be found in Hewitt's *Ancient Armor and Weapons in Europe*. By every warlike people the B. has been regarded as the emblem of national honor, as a palladium for the defense of which the individual warrior was at all times ready to sacrifice his life. From the converse of this feeling banners and flags taken from the enemy have always been regarded as special trophies of victory, and places of honor in churches and public buildings have consequently been assigned them. As to the flags borne by the ships of different nations and the arrangements concerning them in peace and war, see FLAG; as to colors of regiments, see COLORS.

The relation which banners bear to other kinds of flags in their forms and uses will be explained under COLORS, MILITARY; ENSIGN; FLAG; PENDANT, etc.

Banner displayed is the term used by heralds to describe a B. open and flying.

BANNERET, a higher grade of knighthood conferred by the sovereign for some heroic act performed in the field, and so called because the pennon of the knight was then exchanged for the banner—a proceeding which was effected by the very simple

means of rending the points from the pennon. The first B. in England is said by Froissart to have been made by king Edward I., and the last time the honor was conferred was by Charles I. after the battle of Edgehill, the recipient being an individual who rejoiced in the familiar name of John Smith. The ceremony of the creation of a knight-B. must have been very impressive to persons filled with the ideas which were prevalent in the ages of chivalry. The king, or his general, at the head of his army, drawn up in order of battle after a victory under the royal banner displayed, attended by all the officers and nobility of the court, received the B. elect, who was not necessarily a knight previously, led between two knights of note or other men famous in arms, carrying his pennon in his hand, the heralds walking before him and proclaiming his valiant achievements, for which he deserved to be made a knight-B., and to display his banner in the field. The king, or general, then said to him: "Advance, Banneret!" (*advances toy banneret*), and caused the point of his pennon to be torn off. The new knight, with the trumpeters sounding before him and the nobility and officers bearing him company, was sent back to his tent, where a noble entertainment was provided by the king. Some attempts have been made to revive the title in recent times, as when George III., at a review of the navy at Portsmouth in 1773, conferred it on admiral Pye and several other officers.

BANNOCK, a cake of home-made bread, common in the country parts of Scotland, but now less so than formerly. It is usually composed of pease-meal or pease and barley-meal mixed; prepared without any leaven, it is baked on a circular plate of iron called a girdle. When made of mixed meal it is called a mashlum bannock. "Bannocks of barley-meal" form the theme of a popular Scottish song. A superior kind of B., called a Selkirk B., from the place where it is made, resembles the finer and lighter species of tea-cakes prepared by bakers. The word B. is from the Gaelic *bonach*, a cake. In the w. of Scotland it is pronounced *bunnock*. There is an amusing fairy-tale called *The Story of the Wee* (little) *Bunnock*. The B. is doubtless of great antiquity, being, in fact, the primitive cake, only varied in material, of every country.

BANNOCKBURN, a village in the e. of Stirlingshire, 3 m. s.s.e. of Stirling, on the Bannock rivulet, which falls a few miles below this into the Forth. Near this was fought the great battle of B. on Monday, 24th June, 1314. Robert Bruce, with 30,000 Scotch, gained a signal victory over Edward II. with 100,000 English, and secured his throne and the independence of Scotland. The English are said to have lost 30,000, and the Scotch 8000 men. The "bore stone," on which Bruce is said to have fixed his standard on that eventful day, is still to be seen on an eminence near the scene of the fight. On the s.e. of the field of B., at Sauchie Burn, James III. was defeated in 1488 by his rebellious subjects and assassinated after the battle in a mill where he had taken refuge. B. is now an important seat of the woolen manufactures, especially those of tartans and carpets. It has long supplied the tartan worn by the highland regiments. Tanning is carried on to some extent and the neighboring villages are noted for the manufacture of nails. Coal abounds in the vicinity. Pop. '71, 2258.

BANNS, or BANS, in the law of England means a proclamation, or public notification, or summons, in which general sense, however, it may be said to have become obsolete. It is now chiefly, if not solely, used in the publication of intended marriages, as to which see next article.

BANNS, or BANS OF MARRIAGE. This is one of three alternative preliminary forms now essential to the legal celebration of marriage in England. The other two are marriage by license and marriage by a registrar's certificate. B. of M., like many of our ecclesiastical regulations, has its origin in the ancient practice of the Roman Catholic church, which our reformers wisely refrained from abolishing. By the publication of these B. is meant the legal proclamation or notification within the parish, district, or chapelry, and in the proper church or chapel, of the names and descriptions of the persons who intend to be there married; the notoriety of the solemn act, so that all who have objections to the marriage may be enabled to state them in time. According to the old English canon law, the publication of B. might be made on *holidays*; but a change was made to *Sundays* by the first important marriage act, the 26 Geo. II. c. 33; and although that act was afterwards superseded by the 4 Geo. IV. c. 76, the regulation as to Sundays has been since continued. Seven days notice at least must be given to the clergyman before publication of bans. The other acts in force are the 6 and 7 Will. IV. c. 85, the 1 Vic. c. 22, the 3 and 4 Vic. c. 72, and the 19 and 20 Vic. c. 119. The law, as contained in these acts of parliament, is as follows: By the 4 Geo. IV. c. 76, s. 2, it is enacted that all B. of matrimony shall be published in audible manner, according to the rubric prefixed to the marriage service in the *Book of Common Prayer*, upon three Sundays preceding the ceremony, during the time of morning-service, or of evening service (if on the day of publication there shall be no morning-service) immediately after the second lesson. The rubric referred to is in the following terms: "I publish the banns of marriage between M. of —— and N. of ——. If any of you know cause or just impediment why these persons should not be joined together in holy matrimony, ye are to declare it. This is the first [second, or third] time of asking." By the 22d section of the same act, all marriages celebrated without such publication of B., or without license (or now, under the 6 and 7 Will. IV. c. 85, s. 42, without a registrar's certificate),

are declared to be null and void. By the 26th section of the last mentioned act, the bishop, with consent of the patron and incumbent, may license chapels for the celebration of marriages in popular places; and by the 33d section of the 1 Vic. c. 22. B. may be published in such chapels. By section 9 of the 4 Geo. IV. c. 76, it is provided, that if the marriage be not celebrated within three months after publication of B., the marriage shall not take place until the B. shall have been republished on three several Sundays, unless it be a marriage by license, or now, by certificate, which two latter alternatives, however, must also be availed of within the three months. It only remains to be added on the law, as contained in these marriage acts, that by section 8 of the last of them, the 19 and 20 Vic. c. 119, it is provided, that in every case in which one of the parties intending marriage without license shall dwell in Scotland, a certificate of proclamation of B. in Scotland, by the session-clerk or by the registrar of the district or parish in which such proclamation shall have been made, shall, when produced to any person duly authorized under the provision of this act to solemnize a marriage, be as valid and effectual for authorizing such person to solemnize such marriage as the production of a certificate for marriage of a superintendent register of a district in England would be, in reference to a party resident within such district.

The purpose of the law is to secure public knowledge of intended marriages, and therefore, although the 4 Geo. IV., following in this respect the 26 Geo. II., declares that marriages shall be void without publication of B. (where, of course, that is the chosen preliminary), it is not necessary that such publication should be made in the real baptismal names of both or either of the parties; it is sufficient that the B. be published in the names by which the parties are *known*, or either of them. Nay, it even appears that where the baptismal names have been discovered, having been previously concealed or unknown, it is better, if not necessary, that publication should be made in the names by which the parties are familiarly known in the district, by which, indeed, they may be said to be known to the world. There are numerous cases decided in England from which such doctrine necessarily follows. As the publication of banns invites people to object, if the parent or guardian express dissent, it is the duty of the clergyman, when such objections are offered, to proceed no further; and if he, notwithstanding, marry the parties, he will be liable to severe penalties by the ecclesiastical law, though he will not be liable to an indictment. Again, on the other hand, if he refuse, without cause, to perform the marriage, he is liable to an action. It has also been decided, that a fraudulent knowledge of a wrong name in the publication of B. will not void the marriage, unless the fraud should be on both sides.

In Scotland, B. have the same Roman Catholic origin as in England. Indeed, Mr. Erskine, one of the most authoritative Scotch legal writers, gives it as his opinion, that the Scotch borrowed the practice from the decrees of the *Council of Trent;* but a recent able writer (see *Fraser's Domestic Relations*, vol. i. p. 113) considers this opinion erroneous, and shows that B. were first sanctioned in Scotland by councils which were held in that country long before the Council of Trent. After the reformation in Scotland, the practice of proclaiming B., as the phrase is in that country, was continued. They are described in the Scotch act 1661, c. 34, "as a part of the laudable order and constitution of the kirk;" and they have since been mentioned in various acts of parliament applicable to Scotland, such as the 10 Anne, c. 7, and 4 and 5 Will. IV. c. 28. By the first of these acts, the privilege of publicly celebrating marriage was extended to the Scotch *Episcopalian* clergy, but with a proviso that the B. should be duly published three Lord's days, not only in the Episcopal churches which the parties frequent, but also in the parish church or churches. Should the parish minister, however, neglect or refuse to publish the B. of such parties, the act declares that it shall be sufficient to do so in any Episcopal congregation alone. The 4 Will. IV. c. 28, put other dissenting bodies in Scotland in the same position as the Episcopal church there. There is one other regulation of the Scotch law on this subject which is deserving of notice for popular information—namely, that when both of the parties have their *domicile* (q. v.) within Scotland, and enter into marriage in England or Ireland, they must have their B. proclaimed in the parish of their domicile in Scotland, otherwise they are liable to the penalties of clandestine marriage. By the marriage notice act, 1878, marriage certificates in Scotland are also issued by the district registrars, after seven days' publication, to persons resident for fifteen days in the district; the fee for registry is 1*s.* 6*d.*

The Scotch law differs from the English in regard to the effect of non-publication of banns. In England, in some cases, the consequence is to render the marriage absolutely void. In Scotland, however, marriage, without proclamation of B., is valid; but in such case the parties, celebrator, and witnesses are liable in the above penalties. See MARRIAGE, SPECIAL LICENSE, REGISTRATION OR BIRTHS, DEATHS, AND MARRIAGES.

BANQUETTE, in fortification, is a raised ledge or step inside the parapet of a rampart, of such a height that musketeers, when standing on it, may be able to fire over the crest of the parapet without too much exposure to the enemy. It is about four ft. wide, and four or four and a-half ft. below the crest. The musketeers ascend to it from the rampart either by a few steps or by a sloping path.

BANQUO, a Scotch warrior of the 11th c., the progenitor of the royal house of Stuart. In 1066, he joined Macbeth in a conspiracy against king Duncan, but was treacherously

slain by his confederate. Shakespeare does not mention him as a conspirator, but only as Macbeth's victim.

BANSHEE. See BENSHIE, *ante*.

BANSWARRA, a Rajpoot state in the w. of Malwa, bordering on Guzerat. It extends from n. lat. 23° 10′ to 23° 48′, and from e. long. 74° 2′ to 74° 41′, and has an area of 1500 sq.miles. The pop. is supposed to be about 150,000. This state was dependent on the empire of Delhi until the ascendency of the Mahrattas, by whom it was fearfully oppressed. In 1812, the ruler made overtures to the British government, offering to become tributary on condition of protection; and an arrangement to this effect was concluded in 1818.—The capital, also called B., is on the route from Mhow to Deesa, 123 m. n.w. from Mhow. The majority of the inhabitants are Hindus, but the Mussulmans are also pretty numerous. The palace of the Rawul, or chief, is a large, turreted, battlemented building, on a rising ground overlooking the town, near a beautiful tank, overhung with trees.

BANTAM', a seaport, now decayed, in a residency of the same name, which forms the w. end of Java. It is 40 m. to the w. of Batavia, being in lat. 6° 2′ s., and long. 106° 11′ east. It was founded by the Dutch in 1602, being their earliest establishment in the island. Pop. of residency, 607,400.

BANTAM FOWL, a well-known variety of the common domestic fowl (q.v.), originally brought from the East Indies, and supposed to derive its name from Bantam, in Java. It is remarkable for small size, being only about a pound in weight, and for a disposition more courageous and pugnacious than even that of a game-cock. A bantam-cock will drive to a respectable distance great dunghill-cocks five times its weight, and has been described as "a beautiful example of a great soul in a little body." There are several subvarieties of the bantam. Most of them have the legs much feathered. The flesh and eggs are good, although the eggs are of course small; and the bantam lays well in winter.

BANTENG, *Bos Banteng* or *B. Sondaicus*, a species of ox (q.v.), a native of Java and Borneo, which, in color, shape, horns, and want of dewlap, bears some resemblance to the gaur (q.v.) of India, "but in the skeleton of the gaur, the sacrum consists of 5 vertebræ, and the tail of 19, while in the skeleton of the B., the sacrum consists of but 4 vertebræ, and the tail of 18." The B. is black, with white legs. The hair is short and sleek, the limbs slender. The muzzle is sharp. The back rises into a high arch immediately behind the neck. The B. inhabits forests, and has been generally described as untamable.

BANTING SYSTEM. See OBESITY.

BANTRY, a seaport t. in the s.w. of Cork co., Ireland, in a cove opposite Whiddy isle, at the head of B. bay, and 44 m. w.s.w. of Cork. The two chief streets converge into an open space towards the sea, and mountains, 933 ft. high, rise behind the town. The chief trade is the export of agricultural produce. A little fishing is carried on. In last century, there was an extensive pilchard-fishery here; but the pilchard has now deserted the coast. Many tourists resort to B. in summer. Pop. '71, 2830.

BANTRY BAY, a deep inlet in the s.w. extremity of Ireland, between Crow point and Sheep's Head point, in Cork co. It is 25 m. long, running e.n.e., with a breadth of 3 to 5 miles. It is one of the finest harbors in Europe, affording safe and commodious anchorage for ships of all sizes. Near the entrance on the n. side is a fine large sheltered harbor, formed by Bear island, with a safe passage on both sides. At the head of the bay are two harbors: the one to the s., or the landlocked roadstead of B. harbor, is formed by Whiddy isle, opposite B. town; the other to the n., or Glengariff harbor, is also sheltered by an island, but is small, and narrow at the entrance. The coast around B. B. is rocky and high, consisting of Devonian strata, and exhibiting some of the finest scenery in the kingdom. On the n. side, 17 m. w. of B. town, is the great cataract of Hungry hill, where 3 lakes, at the heights of 1011, 1126, and 1360 ft. above the sea, discharge their waters, by almost continuous cascades, into Adrigoole creek. Near the opening of B. B. a skirmish took place, in 1689, between a small English fleet under admiral Herbert (afterwards lord Torrington), and the French fleet, which conveyed James II. to Kinsale. Several ships of the French invading expedition under gen. Hoche anchored here in 1796.

BANXRING, *Tupaia*, a genus of insectivorous quadrupeds, remarkably differing from the other *insectivora* (q.v.) in their habits, as they climb trees with the agility of lemurs or squirrels. They are also remarkable for their very elongated muzzle. They have soft glistening fur, and a long bushy tail. The few species known are all natives of the Indian archipelago.

BAN'YA (NAGY), or NEU'STADT, a t. of Hungary, province Szathmar, with a royal mint, and productive gold and silver mines. Pop. '69, 9082.

BAN'YAN, or BA'NIAN, *ficus Indica*, a tree, native of India, remarkable for its vast rooting branches. It is a species of fig (q.v.); has ovate, heart-shaped, entire leaves, about 5 or 6 in. long; and produces a fruit of a rich scarlet color, not larger than a cherry, growing in pairs from the axils of the leaves. The branches send shoots down

wards, which, when they have rooted, become stems, the tree in this manner spreading over a great surface, and enduring for many ages. One has been described as having no fewer than 350 stems, equal to large oaks, and more than 3000 smaller ones, covering a space sufficient to contain 7000 persons. The branches are usually covered with monkeys, birds, and enormous bats. The monkeys eat both fruit and leaves. The vegetation of the B. seldom begins on the ground. The seeds are deposited by birds in the crowns of palms, and send down roots which embrace and eventually kill the palm. As the B. gets old, it breaks up into separate masses, the original trunk decaying, and the props becoming separate trunks of the different portions. The wood of the B. is light, porous, and of no value. The bark is regarded by the Hindoo physicians as a powerful tonic, and is administered in diabetes. The white glutinous juice is used to relieve tooth-ache, and also as an application to the soles of the feet when inflamed. Bird-lime is also made from it. Gum-lac is obtained in abundance from the B.-tree. The B.-tree is beautifully described by Southey in his poem, *The Curse of Kehama*.

BANYULS-SUR-MER, a t. of France in the Pyrénées orientales, with a fishing-port on the Mediterranean. The celebrated wines of Grenache and Rancio are produced in this district. Near the town are 4 old towers, one of which marks the division between France and Spain. B. was the immediate scene of many encounters between the French republicans and the Spaniards during the first French revolution. Pop. '76, 2277.

BANYUWAN'GY, or BANJOUVAN'GY, an important seaport t. and military post belonging to the Dutch, on the e. coast of Java, capital of district of same name, which has a pop. of 45,000.

BANZ, a Benedictine abbey in upper Franconia, near Lichtenfels, on the Main; founded in the 11th c., and celebrated for the superior culture of its monks. During the peasant's war in the 16th c., the abbey was destroyed, but immediately restored, again destroyed in the thirty years' war, and again restored. In 1802, it was broken up, the books and collections were scattered among German institutions, and the building became the summer residence of the king of Bavaria.

BA'OBAB. See ADANSONIA.

BAPAUME, a fortified t. of France, department of Pas-de-Calais. A portion of the allied troops advanced to this place after compelling the French to abandon their fortified position, and to retreat behind the Scarpe, in Aug., 1793. Pop. '76, 3190.

BAPH'OMET is the name of a mysterious symbol, which was in use among the templars. According to the oldest and most probable interpretation, the word is a corruption of Mahomet, to whose faith the members of the order were accused of having a leaning. The symbol consisted of a small human figure cut out of stone, having two heads, male and female, with the rest of the body purely feminine. It was environed with serpents, and astronomical attributes, and furnished with inscriptions for the most part in Arabic. Specimens are to be found in the archæological collections of Vienna and Weimar. Hammer, however, in his *Fundgruben des Orients*, derives B. from Gr. *baphè*, baptism; and *metis*, council or wisdom. He charges the knights with a depraved Gnosticism, and makes the word signify the baptism of wisdom—the baptism of fire; in short, the Gnostic baptism—a species of spiritual illumination, which, however, was interpreted sensually by later Gnostics, such as the Ophites (an Egyptian sect of the 11th c.), to whose licentious practices he declares them to have been addicted. But this explanation is generally discredited.

BAPTISM (Gr. *bapto*, to dip or wash, or to stain with a liquid), one of the sacraments (q.v.) of the Christian church, deriving its name from the outward rite of washing with water, which forms an essential part of it. B. is almost universally acknowledged among Christians as a sacrament, and is referred to the authority of Christ himself, whose express commandment is recorded in the gospels (Matt. xxviii. 19; Mark xvi. 16). B. is frequently mentioned in the New Testament as a divine ordinance.

The name and the rite were not, however, altogether new when the ordinance was instituted by Christ. Religious meanings were early attached to washings with water, both by heathens and Jews; they were among the ordinances of the Jewish law; and it is not necessary to go beyond that law to find the origin of the custom of washing or *baptizing* proselytes upon their admission into the Jewish church. Washing with water was requisite for the removal of ceremonial uncleanness, and every proselyte must have been regarded as, prior to his admission into the Jewish church, ceremonially unclean. John the Baptist baptized not proselytes upon their renouncing heathenism and entering the Jewish church, but those who, by birth and descent, were members of it, to indicate the necessity of a purification of the soul from sin—a spiritual, and not a mere outward change.

One of the most important of the controversies which have agitated the Christian church as to B., is that concerning the proper subjects of B., whether adults only who profess faith in Christ are to be baptized, or if this ordinance is to be administered to their infants also. See BAPTISTS, and BAPTISM, INFANT. The B. of adults was certainly more frequent in the apostolic age than it has ordinarily been where the B. of infants has prevailed; for which an obvious cause presents itself in the fact, that the first members of churches were converts from Judaism or from heathenism. It is, however, gen-

erally held by those who advocate the B. of infants, that it was the practice of the apostles and of the church of the apostolic age to baptize the infants of Christians; which, on the other hand, is as stoutly denied, and infant B. is alleged to have crept in along with other corruptions. For neither opinion can any positive historical proof be adduced, the arguments on both sides being purely inferential.

It is admitted, on all hands, that at an early period in the history of the church, B. was administered to infants, although, according to Neander, even after "it had been set forth as an apostolic institution, its introduction into the general practice of the church was but slow." He finds "the first trace" of it in Irenæus. It was opposed by Tertullian about the end of the 2d c.; and was advocated by Cyprian, and acknowledged as an apostolic institution in the North African church and in the Alexandrian and Syro-Persian churches in the 3d c.; but it is not until the 5th c. that it became fully established as the general practice of the Christian church. It has unquestionably continued to be the general practice from that period to the present day; feebly opposed by some of the sects of the middle ages, and more vigorously by some of those who have adopted the general principles of the reformation. See BAPTISTS.

Both the practice of infant B., and the neglect of it in the early ages of the church, were connected with particular views of religious doctrine, and of the nature and purpose of B. itself. The prevalence of the Augustinian doctrine of original sin is generally regarded as a principal cause of the prevalence of infant B.; but Pelagius, whilst opposing that doctrine, maintained the necessity of infant B., apparently upon the ground that the kingdom of heaven can be attained by human beings only through God's grace. No little influence in favor of infant B. must be ascribed to the growing belief of the absolute necessity of B. to salvation, and of a sort of mysterious efficacy in the rite itself. It is certain, on the other hand, that the belief in the forgiveness of sins in B. led to a practice of deferring it as long as possible, that all sins might be blotted out at once; thus the emperor Constantine the great was baptized only a short time before his death. The approach of a war or pestilence caused many to rush forward in haste to be baptized, who had previously delayed.

Two modes of B. are practiced: by immersion or dipping, and by aspersion or sprinkling, concerning which there has been much controversy in the early period of the church's history, as well as in recent times. Affusion, or pouring, the common practice of the Church of Rome, may be regarded as essentially the same with sprinkling. The advocates of sprinkling universally admit the validity of B. administered in the other mode, but the advocates of dipping generally refuse to acknowledge that B. by sprinkling can be true Christian baptism. The opponents of infant B., almost without exception, insist upon immersion; whilst aspersion or affusion of water is general, except in the eastern churches, wherever the B. of infants prevails. The argument upon which Baptists depend most of all is from the word B., and the verb *baptizo*, to baptize, which also, in classic Greek, signifies to immerse. On the other side, it is contended that a strict limitation to this sense does not well accord with its character as a "frequentative" form of *bapto;* and instances are adduced from the New Testament itself, in which this signification cannot easily be attached either to the noun or to the verb, as 1 Cor. x. 2, where Paul says that the Israelites were "baptized unto Moses in the cloud and in the sea;" and Heb. ix. 10, Mark vii. 4, and Luke xi. 38, where both verb and noun are employed concerning the *washings* of the Jews, and the noun even of their washing of "cups, and pots, brazen vessels, and of tables."—To the argument in favor of immersion, derived from the phrases employed when B. is mentioned in Scripture, as when we are told (Matt. iii. 6) that John the Baptist baptized "in Jordan," that our Lord after his B. (Matt. iii. 16) "went up out of the water," that Philip and the Ethiopian eunuch (Acts viii. 38) "went down both into the water;" it is replied that all the passages of this description, even if their meaning were certainly as precise and full as Baptists suppose it to be, are insufficient to sustain the weight of the conclusion as to the necessity of a particular mode of B.; that, however, it is far from being clear that these passages must be interpreted or the meaning of the Greek prepositions so strictly defined as the argument requires; and further, that there are instances mentioned in Scripture which afford a presumptive argument in favor of another mode of B., as where we are told of great numbers added to the church in one day; whilst we have nowhere any intimation of converts being led to any pond or river to be baptized. To the argument drawn from the language of Paul in Rom. vi. 4, Col. ii. 12 (see BAPTISTS), it is replied that it depends upon a fanciful interpretation of these texts.—According to most of the advocates of B. by sprinkling, the great error of their opponents is that of attaching too much importance to the question of the mode of baptism.

It is, however, indisputable that in the primitive church the ordinary mode of B. was by immersion, in order to which *baptisteries* (q.v.) began to be erected in the 3d, perhaps in the 2d c., and the sexes were usually baptized apart. But B. was administered to sick persons by sprinkling; although doubts as to the complete efficacy of this *clinic* (sick) B. were evidently prevalent in the time of Cyprian (middle of 3d c.). B. by sprinkling gradually became more prevalent; but the dispute concerning the mode of B. became one of the irreconcilable differences between the eastern and western churches, the former generally adhering to the practice of immersion, whilst the latter adopted mere pouring of water on the head, or sprinkling on the face, which practice has

generally prevailed since the 13th c.; but not universally, for it was the ordinary practice in England before the reformation to immerse infants, and the *fonts* (q.v.) in the churches were made large enough for this purpose. This continued also to be the practice till the reign of Elizabeth; and the change which then took place is ascribed to the English divines who had sought refuge in Geneva, and other places of the continent, during the reign of Mary. To this day the rubric of the church of England requires, that if the godfathers and godmothers "shall certify him that the child may well endure it," the officiating priest "shall dip it in the water discreetly and warily;" and it is only, "if they shall certify that the child is weak," that "it shall suffice to pour water upon it," which, however, or sprinkling, is now the ordinary practice.

B. was accompanied, from an early period in the history of the church, with various forms and ceremonies, besides the simple rite of washing with water and the pronouncing of the formula which declares it to be "in the name of the Father, and of the Son, and of the Holy Ghost." These ceremonies are almost all retained in the church of Rome, and also generally in the oriental churches, but have been entirely or almost entirely laid aside by Protestants. The church of England retains the sign of the cross made upon the forehead after B., but the other Protestant churches in Britain reject it. It was an ancient custom that the *catechumens*, as candidates for B. were called whilst receiving instruction with a view to that sacrament, when they were to be baptized, publicly made a profession of their faith and a renunciation of the devil and all his works. The profession of faith is still retained by Protestant churches as the formal ground of the administration of B.; the renunciation of the devil and his works is required by the church of England of the person baptized, if an adult, or of the *sponsors* or "sureties" of a child.—Sponsors (q.v.) were early admitted to answer for those who could not answer for themselves, and particularly for infants. The belief in the absolute necessity of B. to salvation led even to B. of the dead among the Montanists in Africa, in which sponsorship was also introduced. Presbyterian and independent churches generally reject all sponsorship, and regard the profession made by parents as simply a profession of their own faith, which entitles their infants to baptism. The ancient practice of exorcism (q.v.) immediately before B. has been rejected as superstitious by almost all Protestant churches; as have also that of immersing three times (*trine immersion*), or sprinkling three times, with reference to the three persons of the Godhead—that of breathing upon the baptized person, "to signify the expulsion of the devil, and to symbolize the gift of the Holy Spirit—that of anointing with oil (*chrism*, q.v.) to symbolize the same gift, or to indicate that the baptized person is ready, as a wrestler in the ancient games, to fight the good fight of faith—that of giving him milk and honey, in token of his spiritual youth, and of his reception of spiritual gifts and graces—that of putting a little salt into his mouth, to signify the wisdom and taste for heavenly things proper to a Christian—that of touching his nostrils and ears with spittle, to signify that his ears are to be ever open to truth, and that he should ever feel the sweet odor of truth and virtue—and that of clothing him after B. with a white robe (the *chrysome*), in token of the innocence of soul which by B. he was supposed to have acquired. The white robe and the anointing with oil were retained in the church of England for a short time after the Reformation.—The giving of a name in B. (see the article NAMES) is no essential part of it, but is a custom apparently derived from that of the Jews in circumcision (Luke i. 59–63).—The church of Rome prefers the use of holy-water (q.v.) in B., but regards any water as fit for the purpose in case of necessity.—According to an ancient usage, long obsolete, the ordinary administration of B. was limited to the two great festivals of Easter and Whitsuntide.—Whether B. may be administered in private, has been much debated, both in ancient and modern times. The administration of B. in private houses, and not in the presence of a congregation, was one of the things earnestly contended against by the Presbyterians in Scotland in the first half of the 17th c.; their opposition being grounded, not only upon hostility to what they deemed usurpation of authority, but upon the danger of superstitious views of baptism. And apparently upon this latter ground, B. in private houses is also discouraged, even while it is allowed, if there is "great cause and necessity," by the church of England; yet it has become very frequent both in the church of England and among the Presbyterians of Scotland.

Some of the most important questions concerning B. will be most appropriately noticed in the article SACRAMENT, particularly those relating to its place in the Christian system and among the means of grace. The opinions early became prevalent, that forgiveness of sins is obtained in B., and spiritual life begun, and that it is indispensably necessary to salvation—exception being only made, if any was made at all, of the case of believers, adult persons, who desiring B., were prevented from being baptized, and particularly of those who suffered martyrdom, which was generally held to be equivalent to baptism. The church of Rome still owns, as supplying the place of B. by water, these two—B by desire, and B. by blood—i e., in martyrdom.—According to the general doctrine of the Protestant churches, B. is "a sign and seal" of the covenant of grace, representing as a sign the blessings of the covenant, and as a seal, confirming the covenant. As a sign, it is generally held to represent in its rite of washing, the removal both of guilt and corruption, by the blood and by the Spirit of Christ, and so to relate equally to pardon and regeneration, although some have limited its

symbolic reference to regeneration alone. One of the most important points disputed concerning B., is that of baptismal regeneration. See REGENERATION.

Some early Christian sects appear to have rejected B., on grounds somewhat similar to those on which it is rejected by Quakers (q.v.) at the present day, who explain the passages which relate to it symbolically, and insist that a spiritual B. is the only real B. of Christians.—The Socinians also in modern times have maintained that B. is not an ordinance of permanent obligation, but a merely symbolical rite of little importance.

Much controversy has taken place concerning *lay baptism*. Wherever there is a recognized ministry in the church, there is a general agreement in referring the ordinary administration of B. to those who hold this office. It might be expected that the more strongly the necessity of the transmission of *holy orders* by apostolical succession is asserted, the more strongly also would exclusiveness be manifested with regard to the right of the *clergy* to administer B. But this tendency is counteracted by the belief in the necessity of B., or at least of its great importance to the salvation of infants; so that from an early period lay B. was allowed, although not without a struggle, in cases of apprehended danger; and in the church of Rome, this principle is logically carried out to the fullest extent, and even women are authorized to administer B. in cases of necessity. On the same ground, lay B. was at first permitted in the Protestant church of England; but the prevalence of other views led to a kind of formal restriction of the right of administering it to "lawful ministers," although in practice the validity of lay B. is still generally recognized.

Another question much agitated in the church from early times, is that concerning the validity of B. by heretics. The opinion ultimately prevailed, that B. by heretics is valid, except in the case of those who do not baptize in the name of the three Persons of the Godhead. This continues to be the almost universal opinion. Few Protestant theologians hesitate to acknowledge the validity of B. administered in the church of Rome.

The *B. of bells* is a custom supposed to have been introduced about the 10th c., and still retained in the church of Rome. The term *benediction* is sometimes substituted for B.; but the rite itself is very similar to that of B., and is accompanied with many similar ceremonies—"a sort of exorcism," sprinkling with holy-water, anointing "with the oil of catechumens," and "with chrism," a formula of consecration "in the name of the Father, Son, and Holy Ghost," and sometimes also, if not always, the giving of a name to the bell consecrated, and even a kind of sponsorship as by godfathers and godmothers in baptism. This custom has no doubt greatly fostered the notion of an efficacy in the ringing of bells for protection in storms, and for other benefits; indeed, it is expressly avowed that "the bells are blessed to turn off storms and tempests from the faithful."

BAPTISM, INFANT. The chief arguments in favor of infant B. are based upon the proposition that the church is one throughout all changes of dispensation. From this it is argued that as infants were, so they still must be included in the visible church. It is maintained that in all covenants which God has made with men, their children have been included; that the covenant with Abraham was a renewed revelation of the covenant of grace, the temporal promises made to him being connected with the greatest spiritual promises; that circumcision was a seal of the covenant with respect to these, in which the children of Christians have the same interest that Jewish children had; and that B. is a seal of the covenant now as circumcision was, the things to which it has immediate reference being also blessings which children are capable of. It is contended that the arguments in favor of infant salvation derive additional strength from that view of the place of infants in the church according to which they are entitled to baptism. The passages which connect B. with faith are regarded as exclusively relating to adults, like the passages which connect salvation with faith and repentance. In reply to the argument that there is no express command for infant B., it is argued that the state of the case rather demands of those who oppose it the production of an express command against it, without which the general command must be held to include it; the words and actions of our Saviour (Mark x. 14) with respect to children are quoted as confirming the opinion that the place of infants in the church is precisely what it was under the Jewish dispensation; and it is contended that it would have been a very great restriction of privilege in the new dispensation if infants had been excluded from a place which they held before, as entitled to a seal of the covenant, whereas it is evident that the new dispensation is characterized not by restriction but by enlargement of privilege.—Those who hold the doctrine of infant B. are styled Pedobaptists.

The Roman Catholic and Lutheran churches regard the B. of infants as admitting them into the church, and making them members of Christ's body. The reformed (q.v.) churches hold that the children of Christians are included in the visible church from their birth, and therefore entitled to baptism. These are the natural starting-points of very different systems.

BAPTISTERY (Gr. *baptisterion*, a large vase or basin), the name given sometimes to a separate building, sometimes to the portion of the church itself in which the ceremony of baptism was performed. In the latter case, the B. was merely the inclosure containing the font, to be seen in most English churches. According to the earlier arrangements of the Christian church, however, the B. seems usually to have been a

building standing detached from, though in the immediate vicinity of the church to which it appertained. Baptisteries, at first, were either hexagonal or octagonal, but afterwards became polygonal, and even circular. The B. of St. Giovanni in Fonte, at Rome, commonly known as the B. of Constantine, is octagonal, whilst the church of St. Constantia, which was originally a B., is circular.

The celebrated B. of Florence is an octagonal structure, measuring about 100 ft. in diameter. It stands detached from, but in the immediate vicinity of the cathedral. It is built of black and white marble, in the style which Giotto is said to have introduced, and which is still peculiar to Florence. Internally, a gallery, which runs nearly round the whole building, is supported by 16 large granite columns, and the vaulted roof is decorated with mosaics by Andrea Tafi, the pupil of Cimabue. But the magnificent bronze doors, with their beautiful bass-reliefs, are the most remarkable feature of this famous baptistery. The most celebrated of the three doors was executed by Lorenzo Ghiberti, the earliest being the work of Andrea of Pisa. Fifty years were required for their completion; and it is remarkable that the contracts for their execution are still preserved. Next in importance, and of even greater size, is the B. of Pisa. It is circular in form, the diameter measuring 116 feet. Externally, it is divided into three stories, the two under ones being surrounded by columns, of which the upper are smaller and more numerous than the under. The building is raised from the ground on three steps, and terminates in a pear-shaped dome, which is famous for its echo, the sides acting as whispering-galleries. The largest B. ever erected is supposed to have been that of St. Sophia, at Constantinople, which was so spacious as to have served on one occasion for the residence of the emperor Basilicus.

BAPTISTS (sometimes called *Antipedobaptists*, as opposed to *Pedobaptists*, or those who advocate infant baptism*). This denomination of Christians refuse to acknowledge any great name as founder of their sect. They trace their origin to the primitive church itself, and refer to the Acts of the Apostles and their epistles as affording, in their opinion, incontestible evidence that their leading tenets had the sanction of inspiration. When Christianity became corrupted by the rise of Antichrist, they point to the maintenance of their scripture practice among the Cathari and Albigenses and other sects of the middle ages, who, in the midst of surrounding darkness, continued to hold fast the apostolic testimony. They sprung into notice in England under Henry VIII. and Elizabeth. They were persecuted under both reigns, but they received freedom to meet for worship from James II., and complete religious liberty under William III. Ever since, they have diffused their principles extensively in Great Britain and North America; many of their ministers have done good service to the cause of science and literature, and, both as preachers and writers, have taken a position of eminence in society.

The B. hold the plenary inspiration and supreme authority of the Holy Scriptures as a revelation from God; the equal deity of the Son and the Holy Spirit in the unity of the ever blessed Trinity. But, as a condensed view of opinions cannot be expected in this work, it may be as well to state that the denomination are distinguished by almost all the shades of belief which exist in other bodies. They have among them Calvinists both *hyper* and moderate, also high and low Arminians, diverging off in every variety of shade from a common center. The great body of them in Britain and America hold the doctrine of Calvinism in a modified form; that is to say, they maintain the *sufficiency* of the atonement for *all men:* the limitation for which some have pleaded, they consider, lies in its *application* to the sinner by the sovereign grace of God through faith. They maintain the necessity of regeneration and holiness of life as essential to true religion, and that "without holiness no man shall see the Lord;" and their conduct, in general, will bear a comparison with any class of their co-religionists.

Particular B., so called because holding that Christ died for an elect number, and *General* B., who maintain that he died for all men, constitute the two leading sects into which the body is divided. *English* B., in their church order and government, are the same as Congregationalists, the rite of baptism excepted. *Scotch* B., properly so called, insist on a plurality of pastors in every church, and the exercise of mutual exhortation by the members in their public assemblies. There are Baptist churches in England, however, who are *Scotch* in their order, and English B. in Scotland who are *English* in theirs. Seventh-day B., we believe, are to be found almost wholly in America, who observe not the first day of the week, but the seventh, as a day of rest. There are, besides these great divisions, various small associations of B. scattered over Great Britain, America, and the continent of Europe, whose opinions cannot be gathered up into systematic arrangement, and who would not approve of being identified with any of the sectarian designations here set down.

The particular tenet which characterizes B. among their fellow-Christians is, that baptism is an ordinance the validity of which depends on an intelligent faith on the

* The Baptists of Great Britain and America reject the name of Anabaptists, as expressing only an accidental circumstance of their tenets—viz., the rebaptizing of converts from other sects, who happen to have been baptized in infancy, and also as associating them with the scandals of the German Anabaptists (q.v.) of the 16th c., from whom they claim to be historically distinct. From the same feeling, the modern sect in Germany and Holland style themselves *Taufgesinnte*.

part of the recipient. Their views on the matter of baptism may be reduced to two heads—the *subjects* and *mode* of baptism. The subjects of the baptismal rite they hold to be believers in the Lord Jesus Christ. They ground their faith in this matter on the following positions—namely: 1st, The Lord in his commission to his apostles associates teaching with baptism, and *limits* the administration of the rite to *the taught*. 2d, The Acts of the Apostles shows how they understood their Master, for they baptized none but believers, or such as appeared to be so. 3d, That the kingdom of Christ as it appears in this world is restricted to credibly converted persons, as is shown in his discourse with Nicodemus: "Except a man be born again, he cannot see the kingdom of God;" and his subsequent statements on to the hour when he emitted his memorable confession before Pilate, "My kingdom is not of this world," uniformly proves that its subjects and institutes form a distinct and separate community from the Jewish theocracy, which embraced parents and children in nonage in one commonwealth. 4th, They maintain that the ordinance, as explained in the New Testament, always points to a moral and spiritual change, apart from which it were indeed a meaningless ceremony.

As respects the *mode*, the B. hold that only immersion in water *is* baptism. They argue, that the original term *baptizo* conveys this meaning, and no other; that nothing less can possibly answer to the apostle's explanation in Rom. vi. 4, 5, and Col. ii. 12, "buried with him in baptism, wherein also ye are risen with him;" that the many allusions in the epistles to the churches manifestly bear out this interpretation; and, finally, that the fact of John baptizing at a spot selected for the purpose "*because* there was *much water* there," is perfectly conclusive.

Their form of church government is congregational. They maintain that the only order of officers remaining in the church since inspiration ceased are pastors (otherwise called elders and bishops), deacons, and evangelists; that the number of official persons in each of the apostolic churches cannot be ascertained from the record, but must of necessity have depended—and always must depend—on circumstances; that each church is possessed of the power of self-government under its exalted head, Jesus Christ, subject to no foreign tribunal or court of review; that discipline is to be exercised by the rulers in presence and with the consent of all the members, and parties received or excluded at their voice.

The B. are divided among themselves regarding communion—one portion receiving conscientious Pedobaptists to the Lord's table and membership; the other refusing this privilege to any but Baptists. The churches of the former are called open communionists; the latter, strict communionists.

Next to the Moravians, the B. were earliest in the field of missions. They have been honored to plant Christian churches in many parts of continental India, Ceylon, in the Bahamas, the West Indies, Africa, and China. No mission band has arisen in any denomination, within the century, who have surpassed the agents of the B. missionary society in ardent zeal, patient perseverance, and invincible fortitude, in carrying out their Lord's commission to preach the gospel to every creature. The names of Carey, Marshman, Ward, and Knibb will be had in grateful remembrance by all succeeding generations; and their footsteps are now being trod by a long list of Christian missionaries of all evangelical persuasions, who are "the messengers of the churches and the glory of Christ."

This section of the Christian church was probably less zealous than their brethren, at one time, in preparing their ministers for their work by a sound course of study in theology and general literature; but this reproach has been long rolled away. They have schools of learning inferior to none for training young men of piety for pastoral duties, presided over by men of great ability. At Bristol, Rawdon (near Leeds), Regent's park, (London), Pontypool, Haverfordwest, and Nottingham, there exist seminaries of learning which are entitled to give certificates qualifying for matriculation at the university of London; and many of the students have already taken degrees and honors there. There are also the Pastor's college, in connection with the Tabernacle, London, and theological institutions at Edinburgh, Manchester, and Llangollen.

In the *Baptist Handbook* for 1876, the returns of B. churches and members are as follows: British, 2620 churches, 263,729 members; colonial, 1084 churches, 98,149 members; foreign, 22,124 churches, 1,815,868 members; total, 25,828 churches, 2,174,746 members. The United States possessed, in 1874, 21,510 churches and 1,761,171 members. England, in 1875, had 4572 churches and chapels, with 191,763 members; Wales, 1136, with 62,221 members; Scotland, 192, with 8155 members; Ireland, 74, with 1610 members.

BAPTISTS (*ante*). The history of this denomination in the United States can be traced far back towards the first colonizing of New England by the pilgrim fathers. The first B. churches, however, were founded by Roger Williams, in Providence, R. I., and by John Clark, in Newport, R. I., during the year 1639. Williams at first met considerable opposition and persecution for declining to recognize the power of the civil magistrate in matters of religion; but in 1644 he obtained a charter for the land which he and his followers had colonized. It is now called Rhode Island, and was among the first states to grant religious liberty. In the other colonies the persecution of the Baptists lasted many years, occasioned not altogether by their religious views, but in part

by their extreme views regarding civil government. Laws were made against them in Massachusetts in 1644, and some of them were banished in 1669; they were proscribed in New York in 1662, and in Virginia in 1664, but about the beginning of the 18th c. the authorities became more tolerant. It may be said here that the article on religious liberty to be found in the amendments of our constitution is in no small part due to the strenuous efforts of the B. in 1789.

The B. in the United States are divided into several denominations. After the revolution their cause steadily advanced; and the regular or associated B. denomination has now in the United States alone, according to the *Baptist Year Book* for 1879, 1075 associations, 24,499 churches, 14,954 ministers, 11,845 Sunday-schools, with 827,770 volumes in the libraries, and 2,102,034 church members. They have 9 theological seminaries: 2 in New York, at Hamilton and Rochester; 2 in Illinois, at Upper Alton and Morgan Park; 2 in Kentucky, at Georgetown and Louisville; 1 at Newton Center, Mass.; 1 at Upland, Pa., and 1 at Liberty, Mo.; the total number of students being 338, and 37 instructors; the total value of property $1,685,178, and the endowment amounting to $1,245,545. They have 31 colleges and universities, of which Brown university, founded in 1764 at Providence, R. I., is the most celebrated. The more prominent of the others are Colby university, at Waterville, Me.; Madison university, at Hamilton, N. Y.; Columbian university, at Washington, D.C.; the university of Rochester, N. Y.; the university of Chicago, Ill.; and Vassar college for women, at Poughkeepsie, N. Y. Total number of students in all the colleges, 4897, with 269 instructors; total value of property, $7,096,726; amount of endowment, $2,962,275; and 208,835 volumes in the various libraries of the colleges. According to the *Year Book*, they have 47 academies, seminaries, institutes, and female colleges, with 4632 students; a property value of $2,361,000, and endowment of $392,545. The home and foreign statistics for the year 1878 were, for the five continents, as far as reported:

	Associations.	Churches.	Ministers.	Members.
North America	1,096	25,325	15,525	2,192,454
Europe	60	3,053	2,089	308,913
Asia	1	576	234	34,784
Africa	..	54	35	2,794
Australia	4	135	85	7,002
Total	1,161	29,143	17,968	2,545,947
In 1877	1,132	28,513	17,931	2,472,790

As to doctrine, government, and worship, the Calvinistic B. in America, as in England, agree in all essential points, except as to the subjects and mode of baptism, with the evangelical Congregationalists. They require baptism by immersion to entitle them to church membership, denying that any other mode is scriptural or valid. They disallow the baptism of infants, administering that rite to none but believers on the confession of their personal faith. In respect to communing at the Lord's supper with persons not regularly immersed, there is difference of view and of practice among B.—some holding to "open" and some to "close" communion. Open communionists, common among English B., are in this country a very small minority of the denomination.

The B. have been distinguished for zeal and success in evangelizing the newer portions of the country, and must be recognized as supplying much of the Christian force with which American society has been molded. As a denomination, they are positive and aggressive. They are represented in nearly all the great cities by powerful, well-equipped, and rapidly augmenting churches. In missions among the heathen, they have shown great zeal; and though they have not sought to cover a great number of fields, they are not surpassed in modern times in diligent and persevering efforts. In some countries, notably in Burmah formerly, and in northern India recently, their success in missionary labor has risen to grand proportions.

The associated B. in the United States meet annually in stated conventions for the promotion of missions, education, beneficence, etc. They have a publication society at Philadelphia.

BAPTISTS, ANTI-MISSION. See Baptists, Old School.

BAPTISTS, CAMPBELLITE. See Disciples of Christ.

BAPTISTS, FREE-WILL, had their origin in a discussion which arose (1779) among B. in New Hampshire on the doctrines of Calvin, during which Benjamin Randall, one of Whitefield's converts, was called to account for preaching a general atonement and the ability of sinners to accept Christ. Having united with a church which agreed with his views, he was ordained at New Durham (1780), and, in connection with others of like faith, labored with zeal and success in preaching and establishing churches. They wished to be known simply as Baptists, but their opponents called them "free-willers," and both names having been combined, the denomination has adopted "Free-will Baptists" as their distinctive appellation. Their government, like that of the regular Baptists, is congregational, and they hold that scriptural baptism is the immersion of believers. Their peculiar doctrinal views are the general extent of the atonement, the free offer of salvation to all men, the freedom of the will (involving ability to accept or

refuse Christ), and the right of true believers to participate in the Lord's supper. By this last tenet they rank as "open communionists." In 1784, the first quarterly meeting was organized among them; in 1792, the first yearly meeting, composed of delegates from the quarterly meetings; in 1827, a general conference was formed, which now meets triennially. In 1841, the Free-communion Baptists, a denomination which had arisen in the 18th c. in Rhode Island and Connecticut, and owed its origin to Whitefield's preaching, united with them. The whole body have uniformly held anti-slavery views, and, a few years before the war of the rebellion, withdrew fellowship from 4000 members in North Carolina because they were slave-holders; and, for the same reason, declined to receive 12,000 members in Kentucky who sent delegates to their general conference. At the fifth conference (1831), the subject of foot-washing having been discussed, liberty was given to the churches to retain or give up the ordinance, as each might prefer. Many of them have since chosen to give it up. They have flourishing literary institutions in several states; among which are Bates college at Lewiston, Me.; Hillsdale college, Mich.; a theological seminary at New Hampton, N. H.; and a printing establishment at the same place. They have about 1500 churches, 1300 ministers, and 75,000 members, most of whom are in the northern states and Canada.

BAPTISTS, GERMAN, commonly called DUNKERS or TUNKERS (from the German *tunken*, to "dip"), and, among themselves, BRETHREN, originated at Schwarzenau, Germany, 1708, but were driven by persecution to America about 1725. In 1790, a party who held universalist views having separated from them, the whole denomination were, somewhat perversely, supposed to agree with them. But they have always denied the charge and, with the Mennonites, appeal to the confessions of faith published in Holland two centuries ago. They practice trine immersion (placing the candidate forward instead of backward) with the laying on of hands while the person is in the water. Their officers are bishops, elders, teachers, and deacons. The bishops are chosen from among experienced and faithful teachers. It is their duty to itinerate among the congregation, preach, officiate at marriages and funerals, and be present at love feasts, communions, ordinations, elections of teachers and deacons, and when an officer is to be excommunicated. An elder is the oldest teacher in a congregation where there is no bishop. His duties are to appoint meetings, exhort, preach, baptize, travel occasionally, and to perform all the work of a bishop when none is present. Teachers are elected. Their duties are to exhort and preach at stated meetings, and, when requested by a bishop or an elder, to officiate at baptisms and marriages. The deacons take care of the poor widows and their children, visit the families of the congregation to exhort, comfort, and instruct them, reconcile offenses and misunderstandings; and, upon occasion, to exhort, read the scriptures, and pray at meetings. An annual meeting of bishops, teachers and delegates is held about May, at which a committee of five bishops decide cases presented to them by the teachers and delegates. In plainness of speech and dress German Baptists resemble the society of Friends. They do not go to law, will not fight, and seldom take interest on money loaned to their poorer brethren. They are opposed to statistics, as savoring of pride; but, according to recent reports, they have 500 churches, 1,200 preachers, and 50,000 church members, chiefly in Pennsylvania, Maryland, Virginia, Ohio, and Indiana.

BAPTISTS, OLD SCHOOL, a sect frequently called ANTI-MISSION or ANTI-EFFORT B., from their opposition to missionary societies, Sunday schools, and all religious organizations that make man's salvation dependent on human effort. They have neither colleges nor theological seminaries. They are mostly to be found in the western and south-western states. They have 900 churches, 400 ministers, and 40,000 members. At present they are not increasing.

BAPTISTS, SEVENTH-DAY, as their name implies, are distinguished from other Baptists and other denominations by regarding the seventh day of the week as the Sabbath. They believe that the first day was not generally observed as such in the Christian church before the time of Constantine. Traces of seventh-day keepers are found in the days of Gregory I. (590), Gregory VII. (1075), and in the 12th century. In Germany they appeared late in the 15th century. In England they were organized as a denomination in 1650, under the name of Sabbatarians, and, at the close of the c., had 11 churches, of which only three remain. In America they date from the last quarter of the 17th c., having formed their first church at Newport, R. I., about 1671. They commenced their yearly meetings at the opening of the 18th c., and their general conference at the beginning of the 19th c., holding it at first annually, but now triennially. In 1818 they adopted the name Seventh-day Baptists instead of Sabbatarians; and in 1845 arranged themselves in five associations, eastern, western, central, Virginia, and Ohio. They favor total abstinence from strong drink, and other reforms; have a department for publishing tracts and books, and support missionaries in China and Palestine. At the general conference in 1878, 55 churches were represented by letter. They have 75 churches, 82 ministers, and 7,336 members. Their literary institutions are a university at Alfred Center, N. Y., colleges at Shiloh, N. J., and Milton, Wis., De Ruyter institute, N. Y., and several academies.

BAPTISTS, SEVENTH-DAY GERMAN, a denomination in the United States which seceded from the German Baptists, or Dunkers. They recommend celibacy as

a virtue, but do not require it, and worship on the seventh day instead of the first day of the week. Their largest settlement is at Snowhill, Franklin co., Pa. They have probably a few hundred members, and a dozen ministers.

BAPTISTS, SIX-PRINCIPLE, a small denomination, first heard of as a separate organization in Rhode Island in 1639. They are of the Arminian persuasion, holding to a general atonement; and their creed consists of the six principles to be found in Heb. vi. 1, 2, namely: repentance, faith, baptism, laying on of hands, the resurrection, and the eternal judgment. Their ministers are poorly educated and poorly supported, and the denomination is confined to Rhode Island, New York, Pennsylvania, and Massachusetts. They have 20 churches, 12 ministers, and 3,000 members.

BAPTISTS—THE CHURCH OF GOD. See WINEBRENNERIANS.

BAR is any elongated piece of wood, metal, or other solid substance. In the iron manufacture, B. is a rod, either round or square shafted. The round ones are made by drawing the iron red-hot through a bore or hole in a plate, and the square ones by passing it likewise red-hot through a roller-mill between two rollers counter-grooved, with their triangular-grooved faces forming the square opening for the passage of the iron. Railway and knee iron are made in the same manner. See IRON.

BAR, in hydrography, is a bank opposite the mouth of a river, which obstructs or *bars* the entrance of vessels. The B. is formed where the rush of the stream is arrested by the water of the sea, as the mud and sand suspended in the river water are thus allowed to be deposited. It is thus that deltas are formed at the mouths of rivers. The navigation of many streams (as the Danube) is kept open only by constant dredging or other artificial means.

BAR, in music, is a line drawn across the stave, to divide the music into small portions of equal duration; each of these small portions is itself called a *bar*.

BAR, or BARR, in heraldry, one of those more important figures or charges in heraldry which are known as *ordinaries*. By the heralds of this country, the ordinaries, or as, by way of eminence, they are called, the "honorable ordinaries," are commonly reckoned as ten in number, the subordinaries, or minor charges, being greatly more numerous. The B., like the fess (q.v.), is formed by two horizontal lines passing over the shield, but it differs from it in size, the fess occupying a third, the B. only a fifth part of the shield. There is this further difference between these two ordinaries, that the fess is confined to the center, while the B. may be borne in several parts of the shield. There is a diminutive of the B. called the closet, which is half a B.; and again of the closet, called the barrulet, which is half a closet, or the fourth part of a bar.—BAR-GEMEL is a double bar, from the French *jumeau*, f. *jumelle*, a twin.

BAR, in law. This word has several legal meanings; thus, it is the term used to signify an inclosure or fixed place in a court of justice where lawyers may plead, or perhaps more correctly, where they can address their advocacy on behalf of their clients. A veiled-off space within the houses of parliament is similarly called the B. See PLEADING. The dock, or inclosed space where persons accused of felonies and other offenses stand or sit during their trial, is also called the B.; hence the expression, "prisoner at the B." This word is likewise applied to the gate or rail thrown across a turnpike road for the levying of the toll-duties. It has also a general meaning in legal procedure, signifying something by way of stoppage or prevention. There is also a trial at B., that is, a trial before the judges of a particular court, who sit together for that purpose *in banc* (q.v.). See BAR OF DOWER, PLEA, TRIAL AT BAR, TOLL, FELONY, TREASON, BARRISTERS, ADVOCATE.

BAR, PLEAS IN. See PLEADING and PLEA.

BAR, TOLL. See TOLL.

BAR, TRIAL AT. See TRIAL AT BAR.

BARABA', a steppe of Siberia, extending between the rivers Obe and Irtish, and occupying more than 100,000 sq.m., and covered with salt lakes and marshes. It was colonized by the Russians in 1767, who have since cultivated parts of it.

BAR'ABOO, chief t. of Sauk co., Wis., on B. river; pop. of township, '70, 2758. It has a number of manufactories.

BARAB'RA, or BERAB'ERA, people of a district in upper Nubia, different from the Berbers. They trade in cattle with Egypt.

BARACO'A, a seaport t. on the n.e. coast of Cuba belonging to the Spaniards. Lat. 20° 22′ n., long. 74° 30′ w. In its vicinity is a remarkable mountain called the anvil of Baracoa.

BARA'DA, supposed to be the Abana of the Bible; a river of Syria, rising in Anti-Libanus, and ending in marshy lakes e. of Damascus, which city is on the main stream, the stream being made to divide in the city, but uniting again after passing it.

BARA'GA, a co. in n. Michigan, taken from Houghton co. in 1875. Pop. '80, 1804.

BARA'GA, FRIEDRICH, D.D., 1797–1868; a Roman Catholic bishop and missionary, native of Carniola. He came to this country in 1830, and spent his whole life in the

Chippewa and Ottawa missions in Michigan. He wrote a Chippewa grammar and dictionary, and in German, the *History, Character, and Habits of the North American Indians.*

BARAGUAY D'HILLIERS, ACHILLE, a French general, the son of the succeeding, was b. in Paris on the 6th of Sept., 1795. He rose rapidly through the inferior military grades, and obtained, in 1832, the appointment of governor in the military school of St. Cyr, where he suppressed a republican conspiracy that threatened to break out in the institution. After he had served with various success in more than one campaign in Algeria, he was promoted to the rank of lieut. gen., on the 6th of Aug., 1843; and in 1847, he was made inspector gen. of infantry. After the revolution of Feb., 1848, he was chosen a member of the national assembly, in which he joined the party of reaction, and was in favor of the restriction of the press. In the beginning of Nov., 1849, he went to Rome, as commander-in-chief of the French army sent to sustain the authority of the pope. He returned in 1850; and in Jan., 1851, obtained the command of the army of Paris, in the place of Changarnier. B. concurred in the policy of the *coup d'état* of Dec., 1851, and was made a member of the consultative commission. During the Crimean war, he received the command of the French expeditionary corps of the Baltic, and co-operated with the British fleet in the capture of Bomarsund. He was afterwards made a marshal of France, and commanded in the Italian war of 1859. In 1871, he was made president of the court appointed to investigate the conduct of the generals who surrendered fortresses during the late war. He d. 6th June, 1878.

BARAGUAY D'HILLIERS, LOUIS, a distinguished general of the French empire, was b. in Paris in 1764. After serving under Custine and Menou, he received an appointment in the army of Italy from Napoleon, and was a sharer in all the success of the campaigns of 1796–7. He was made a general of division; and in virtue of Napoleon's treaty with the Venetian republic in May 16, 1797, commandant of Venice. B. accompanied the expedition to Egypt; and afterwards successively held appointments in the armies of the Rhine and the Tyrol, and in Catalonia. He headed a division in the Russian campaign of 1812; but on the retreat, he incurred the displeasure of Napoleon. He was sent as governor to Berlin, where he soon after died of grief and exhaustion.

BARAHAT, a t. in n. Hindustan, in the Himalayas, 30° 43′ n., 78° 29′ east. The t. was nearly ruined in 1803 by an earthquake, most of the houses (built of stone with slate roofs) being thrown down. In the neighborhood is a trident in honor of Siva; a copper pedestal upholding a brass shaft 12 ft. high, with forks 6 ft. long. Though this curious trident bears a legible inscription, no one has yet translated it, and the origin of the work is unknown. The temple in which it stood was destroyed by an earthquake.

BARANOFF, ALEXANDER ANDREYEVITCH, 1746–1819; first governor of Russian America. In 1796, he established a colony on Behring's strait; in 1799 took possession of one of the Sitka islands (now Baranoff island), began trade with the natives, and subsequently extended his operations to Canton, Sandwich islands, Boston, New York, and other distant places. He died while on his return to Russia.

BARANTE, AMABLE GUILLAUME PROSPER, Baron de Brugiére, 1782–1866; a French statesman and historian of the dukes of Burgundy. While yet young, he was employed in political missions in Germany, Poland, and Spain, and was prefect at Nantes at the time of Napoleon's return from Elba, when he at once resigned. On the second restoration he was made councilor of state and secretary-general to the minister of the interior, and was elected to the chamber of the deputies. In 1819, he was made a peer of France, and took an active part in the debates of the chamber. After the revolution of 1830, he was sent as ambassador to Turin, and five years later filled the same position at St. Petersburg. He supported Louis Philippe, and retired from public life on the fall of the monarchy in 1848. His great work is the *History of the Dukes of Burgundy of the House of Valois*, which procured for him membership in the academy. He was the author of historical and literary miscellanies, a work on constitutional questions, a history of the national convention, a history of the directory, studies in history and biography, etc.

BARAN'YA, a co. in s.e. Hungary on the Danube and the Drave, on the border of Slavonia; 1966 sq.m.: pop. '70, 283,506, more than half Magyars. It is fertile, producing cereals, tobacco, and wine, and is rich in cattle. Chief towns, Pécs, the capital, and Mohacs, where, in 1526, Hungary's king, army, and independence were lost.

BA'RAS KHOTUN', or BARS KHOTAN', a ruined city on the banks of the Kherlon, one of the head-streams of the Amur, in the Mongol country. Some suppose it to have been built by the emperor Kublai; others, that it was erected by Toghon Timur in the 14th c., after the expulsion of the Mongols from China. The remains of the mud walls show that the city had been 5 m. in circumference.

BARATIERE, or BARETTIER, JOHN PHILIP, 1721–40; a wonder of precocity, a native of Nuremberg, the son of a Protestant pastor, exiled from France on the revocation of the edict of Nantes. Before his 5th year he read and wrote French, German, and Latin, and afterwards, with almost no assistance, mastered Greek, Hebrew, Syriac, Arabic, and Ethiopic. Before he was 9 years old he made a catalogue of the more difficult words in Chaldee and Hebrew, and in his 13th year made a translation of some of the

Hebrew writings of Benjamin of Tudela, with notes and historical disquisitions. About the same time he published theological disquisitions, and amused himself with abstruse astronomical and other mathematical calculations. When but 14 he was made master of arts by the university of Halle, on which occasion he defended 14 propositions before an immense audience. The royal society of Berlin made him a member, and the king gave his father a living. Some time before his death he began a history of the church. He was never strong in health, and the active mental labor, which he would not relinquish, took him away 4 months before he was 20 years old.

BARATYNS'KI, JEWGENIJ ABRAMOVITCH, 1792–1844; a Russian poet. He served as a soldier in Finland, where he imbibed the ideas that appear in his poem of *Eva*. His other notable work is *Gypsy*, a picture of Russian high life.

BARB, the designation of a noble breed of horses cultivated by the Moors of Barbary, and introduced by them into Spain. Barbs are less remarkable for their beauty and symmetry, than for their speed, endurance, abstinence, and gentle temper.

BAR'BACAN. See BARBICAN.

BARBACE'NA, a city of Brazil, in the province of Minas Geraes, 150 m. n.w. from Rio de Janeiro. It is situated on the top of two hills in the Sierra Mantiqueira, and at an elevation of about 3500 ft. above the sea, so that, although within the tropics, it enjoys a mild climate. The streets are broad and straight, the principal ones paved and provided with footpaths. The houses are low, and have gardens behind. The inhabitants are chiefly engaged in gold-mining and in exporting coffee and cotton to Rio de Janeiro. B. is the center of a productive district, the pop. of which is 12,000.

BARBA'DOES, the most easterly of the Caribbees, and the residence of the governor-general of the British Windward islands. See ANTILLES. The lat. and long. of its capital, Bridgetown, are 13° 4′ n. and 59° 37′ west. Its area is about 166 sq.m., or 106,240 acres—the unprecedented proportion of 100,000 being under cultivation. Besides the capital, B. contains 3 other towns, all more or less in a state of decay—Jamestown, Speights-town, and Oistin. B. affords no harbors, being almost encircled by coral-reefs, which here and there extend as much as 3 m. to seaward. Inside of the coral-reefs, the coast, excepting at two points, presents long lines of sandy beach—one of the most remarkable being Carlisle bay with its exposed roadstead, on which Bridgetown stands. Setting aside occasional attacks of yellow fever, the climate is healthy. In 1844, the fall of rain was 72 inches; and the temperature is said to have ranged only between 76½° and 83½° F. Shocks of earthquake are sometimes felt, and thunder-storms are frequent and severe. But hurricanes are the grand scourge of Barbadoes. In 1780, one of them destroyed 4326 persons and property to the value of £1,320,564 sterling; and in 1831, another destroyed 1591 persons and property to the value of £1,602,800 sterling. Of the former of these, the violence appears to have surpassed all belief—the winds and the waves between them having carried a 12 pounder gun a distance of 140 yards.

In 1834, the commencement of the apprenticeship under the imperial act of emancipation, the pop. was 102,231; by 1871, it had increased to 162,042, being an average of 976 inhabitants to every sq.mile. The trade and the revenue bear a similar testimony to the benefits of emancipation. Between 1833–75 the revenue had increased from £20,975 to £132,123; the imports, from £481,610 to £1,187,493; the exports, from £408,363 to £1,174,910 (value of sugar exported, £976,886); the total tonnage entered and cleared in 1875 was 409,176 tons. Being universally cultivated in regular plantations, the island affords no room for the squatting of negroes on unreclaimed lands, as in Jamaca and other West-India possessions. On this account, if from no other cause, the negro population have been compelled to labor diligently for hire, and are generally in a condition most creditable to their industry and prudence, contrasting favorably with some of the lower classes among the whites. Altogether, however, the Barbadians are a shrewd and clever people. B. is the see of a bishop. It contains also many well-endowed seminaries—Codrington college, in particular, having a revenue of £3000 a year. It was first colonized by the English in 1625, having previously been depopulated by the Spaniards. The peace of B. was seriously disturbed in 1876, by riots occasioned by the proposed confederation of the Windward islands, in which several lives were lost, and great damage done to property.

BARBA'DOES CHERRY, the name given in the West Indies to the fruit of two small trees, *Malpighia urens* and *M. glabra*, which are cultivated for its sake. Clusters of fruit are produced from the axils of the leaves. The fruit of *M. urens* is small, that of *M. glabra* is like a mayduke cherry in size and appearance, but inferior in flavor. Each fruit contains three triangular seeds. The leaves of *M. urens* have stinging hairs on the under-side. See MALPIGHIACEÆ.

BARBA'DOES GOOSEBERRY, *Pereskia aculeata*, a pleasant West Indian fruit, produced by a plant of the natural order *cacteæ* (q.v.), with a round stem, thick flat alternate leaves, and large strong spines. The fruit has expectorant properties.

BARBADOES LEG, which seems to be identical with the *elephantiasis of the Arabs*, is a disease which is characterized by hypertrophy of the skin and of the subcutaneous areolar tissue. Notwithstanding its name, it may affect the arm, female breast, etc. It begins with acute febrile symptoms, and inflammation of the superficial lymphatic

vessels. The part swells, and becomes uneasy from tension, the glands being especially large and hard. The skin varies in appearance, being sometimes white and shining, and in other cases of a dark color, and studded with projecting veins. The swelling is sometimes very great, and quite hard. In some parts of the body, skin which would naturally weigh less than a couple of ounces, is thus converted into a tumor weighing from 100 to 150 lbs. The disease is endemic in the tropics; and in the cases which we see in Great Britain, it always appears that the disease commenced in a hot country.

Iodine is recommended by some doctors, and well-regulated pressure by others. The leg has been amputated, in consequence of the annoyance caused by its great weight; but this should be regarded as an ultimate resource, and ligation of the femoral artery, which often causes great subsidence of the swelling, should be first tried.

BAR'BARA, SAINT, who suffered martyrdom at Nicomedia, in Bithynia, about 236, or, according to other accounts, at Heliopolis, in Egypt, about 306, was of good birth, and well educated by her father, Dioscorus. To avoid disturbance in her studies, he had a tower built for her, where she spent her youth in the deepest solitude. While in this retirement, she was led, through Origen, as is said, to embrace Christianity. Her father, a fanatic heathen, learning his daughter's conversion, and failing to induce her to renounce Christ, delivered her up to the governor, Martianus, to be dealt with by the law. Martianus, struck with the intelligence and beauty of the maiden, attempted first by arguments to make her relinquish Christianity, and when that failed, had recourse to the most exquisite tortures. At last, the blinded father offered himself to strike off his daughter's head. Scarcely was the deed done, when he was struck with lightning. Hence St. B. is to this day prayed to in storms. For the same reason, she is the patron saint of artillery, and her image was at one time frequently placed on arsenals, powder-magazines, etc. The powder-room in a French ship of war is to this day called Sainte-Barbe. St. B.'s day is the 4th December.

BARBA'REA. See CRESS.

BARBARELLI, GIORGIO. See GIORGIONE, *ante.*

BARBARIAN (Gr. *barbaros*), among the Greeks, as early as the time of Homer, signified one who could not speak the Greek language; and this restricted signification was not wholly obsolete even in the age of Plato, for the latter divides the entire human race into *Hellenes* and *Barbaroi.* The origin of the word is unknown, if it be not artificially formed, on the principle of imitation, to represent a meaningless babble of sound, such as the Greeks conceived all foreign languages to be. It first began to acquire its secondary and invidious signification at the period of the Persian wars. The Greeks, who always exhibited a proud consciousness of their superior intellect and privileges, employed the term to designate the character of their enemies. It then meant whatever was opposed to Greek civilization, freedom, or intelligence; but it could not yet have attained the degraded sense in which it is now used, for the Romans in the time of Plautus accepted the appellation, and called themselves *Barbaroi.* Subsequently, when Rome, under Augustus, became the mistress of the world, the word was applied to all the Germanic and Scythian tribes with whom she came into contact. In modern times, B. signifies savage, uncivilized, or ignorant.

BARBAROS'SA. See FREDERICK I.

BARBAROS'SA, AROODJE or HARUDJ and KHAIR EDDIN, two brothers, renegade Greeks, natives of Mitylene, who, as Turkish corsairs, were the terror of the Mediterranean during the first half of the 16th century. They made themselves masters of Algeria (q.v.) and Tunis, and brought these countries under the sovereignty of the Turkish sultan.

BARBAROUX, CHARLES, one of the most distinguished and energetic of the Girondists, was b. at Marseilles in 1767. The new ideas of equality and fraternity found in B. a warm advocate, and he did much to promote their spread. He was elected the special delegate of Marseilles, to attend the constituent assembly at Paris. There he opposed the court, and took part with the minister, Roland, then out of favor. After the events of the 10th of Aug., he returned to his native town, where he was received with enthusiasm, and was soon after chosen delegate to the convention. In the convention, he adhered to the Girondists, and belonged to the party who, at the trial of the king, voted for an appeal to the people. As B. boldly opposed the party of Marat and Robespierre, and even directly accused the latter of aiming at the dictatorship, he was, in May, 1793, proscribed as a royalist and an enemy of the republic. He wandered about the country, hiding himself as he best could, for thirteen months, when he was taken and perished at Bordeaux by the guillotine, June 25, 1794. B. understood the revolutionary crisis much better than the most of his party. Had the Girondists generally possessed anything like his energy and sagacity, the Jacobins must have succumbed, and much bloodshed and horror would have been spared to France and the world.

BARBARY, an extensive region in northern Africa, comprising the countries known in modern times under the names of Barca, Tripoli proper, Fezzan, Tunis, Algeria, and Morocco, together with the half-independent province of Sus; and in ancient times, under those of *Mauritania, Numidia, Africa Propria,* and *Cyrenaica.* It stretches from Egypt to the Atlantic ocean, and from the Mediterranean to the desert of Sahara, or between

long. 10° w. and 25° e., and lat. 25° to 37° n. The n.w. of this region is divided by the Atlas mountains into two parts: the northern comprising Morocco, Algeria, and Tunis; the southern, a half-desert region, called Belud-el-Jerid, the country of dates. Though pertaining geographically to Africa, B. is not specially African in any of its characteristics; but in climate, flora, fauna, and geological configuration, belongs to that great region which forms the basin of the Mediterranean. It is watered by many small streams, which either flow into the Mediterranean or into the salt-lakes on the edge of the desert, according as they rise on the northern or southern slopes of the Atlas mountains. A large portion of the country is capable of cultivation, and sandy or rocky tracts are rare, except on the southern margin. During the times of the Carthaginians, Greeks, and Romans, it was richly fertile, and all the natural conditions of its ancient productiveness still remain.—For an account of the climate, geology, productions, etc., see the various countries.

Among the people, besides the French and other Europeans, seven distinct races may be enumerated: Berbers (or Kabyles), Moors, Bedouins, Jews, Turks, Kuluglis, and Negroes. The Berbers and Beduins inhabit the open country, while the Moors, on the other hand, reside in the towns. Most of the Berber tribes are either wholly free, or subject to the mere nominal jurisdiction of native chiefs, kaids, judges, etc. The Beduins luxuriate in equal liberty. Jews had settled here in ancient times, but the greater number of that race immigrated when the Moors were expelled from Spain. The Turks entered B. in the 16th century. They form the dominant race in Tripoli and Tunis, but never established themselves permanently in Morocco. Their sway in Algeria was brought to an end by the French. The Kuluglis (the children of Turks by native mothers) are excluded from the possession of all the paternal rights and privileges. The negroes are not natives of B., but are brought thither as slaves, principally from Sudan and Guinea. They are for the most part domestic slaves. The population, exclusive of Jews and Christians, is about 11,000,000, all Mohammedans. Arabic is the language of commerce and intercourse, and in Morocco, the language of government, and the mother-tongue of Beduins, Moors, and even Jews; but in Tunis and Tripoli, where, as we have said, the Turks are still dominant, the language of government is Turkish. The Berbers proper, or Kabyles, especially in the highlands, to which they have been driven by foreign conquerors, use a peculiar speech among themselves.

In the oldest historical times, we find the Mauri (the ancestors of the modern Moors) mentioned as residing in the n.w. of B., the Numidians in the interior and eastern parts, and the Phenician colonies on the coasts. These last people formed settlements and founded cities—among them Utica, Hippo, Hadrumetum, Leptis, and afterwards Carthage, about 1000 B.C. It does not appear that they ever penetrated far into the interior. Confining themselves to the coast between the Great Syrtis and the straits of Gibraltar, they maintained commerce with the people of the interior and the seaports of the Mediterranean. In the 7th c. B.C., the Greeks founded Cyrene, considerably to the e. of Carthage, and colonized the plateau of Barca, now styled Jebel-el-Achdar by the Arabs. While the Phenician colonies held sway on the coast, the Mauri and the Numidians were divided into several independent tribes, and like their neighbors the Gætuli, were wholly uncivilized. After the second Punic war, the Romans extended their sway over Carthaginian Africa, which became a Roman province at the close of the third Punic war, when the city of Carthage was sacked and destroyed. Numidia was "annexed" after the victory over Jugurtha, and Mauritania after the defeat of king Juba, the ally of Pompey's party. The son of Juba, bearing the same name, was allowed to reign as a nominal sovereign by Augustus, but Mauritania was, in fact a Roman province. Thus, the Romans had acquired a territory in Africa extending from the Great Syrtis to the Atlantic (corresponding to the modern states of B.), which formed some of the largest and most flourishing provinces of their vast empire. Everywhere they built large towns, whose extensive ruins are still to be seen scattered over the whole land, even to the verge of the desert; as, for instance, those at El-Haman, in the regency of Tunis, at Sava, Musulupium, and especially the splendid city of ruins, Lambasa, not far from the desert of Sahara. The Romans had, in general, only two legions, numbering 24.000 men, in their African provinces; nevertheless, their authority was uncontested, and they were enabled to undertake important works, such as the cisterns and aqueducts at Rusicada, Hippo, and Cirta, and the temples and amphitheatres of Calama and Anuna, which clearly show that the inhabitants enjoyed the benefits of a safe and powerful civilization.

Under Constantine, North Africa was divided into the several provinces, Mauritania, Tingitana, Mauritania-Cæsariensis (on the e. of the former), Mauritania-Sitifensis, Numidia, Zeugitania, Byzacium, Cyrenaica, and the Regio Syrtica. At the division of the empire, the whole of these provinces, with the exception of the last, fell to the share of the Western empire. About this time, Christianity was promulgated in Africa, and with such success, that in the three Mauritanias there were more than 160 dioceses. As Roman power declined in Europe, the consequences were severely felt in the African provinces. Religious disturbances, native revolts, and the ambitious aspirations of the Roman governors after independence, loosened the political bands which bound the provinces together, and made them an easy prey to the Vandals, who landed in Africa, in 429 A.D., under the ferocious Genseric, and in an incredibly short space of time over-

ran the country, which they savagely misgoverned until 533, when they were defeated by Justinian's great general, Belisarius. Meanwhile the Numidians and the Mauri had made themselves masters of the interior and of the coast of Mauritania-Tingitana, and the Greek-Roman territories were restricted to the neighborhood of Carthage and some points on the coast. The whole country of B. was thus made an easy prey for the Arabs, and in 647, Abdallah-ben-Said, with 40,000 fanatical Mohammedans from Egypt, defeated and slew the Greek prefect, Gregorius, at Tripoli. He did not, however, follow up his victories; but in 665–670 A.D., the Arabian general, Akbah, conquered the coast towns of Tripoli, founded Cairo, and extended his sway almost to the desert. Hassan, the general of the calif Abd-el-Malek, in 692, stormed, plundered, and destroyed the new Carthage, and, in fact, annihilated the Greek-Roman dominion in Africa. In the course of less than a century, the greater part of the native tribes were converted forcibly to the faith of Islam. In 789, the western provinces separated themselves from the others, and Edris-ben-Abdallah founded there the dynasty of the Edrisites. After 800, when the governor, Ibrahim-ben-Aglab, declared himself independent, and founded the dynasty of the Aglabites, Africa was lost to the califs. From this time down to 1269, the changes of dynasty in B. were so frequent, that we cannot here describe them in detail. The results were, that independent states arose in Algeria, Oran, Bugia, Tenez, etc. About this time, also, began the reaction of the Christian world against Mohammedanism in North Africa and Spain. St. Louis undertook an expedition against Tunis. The Moors were, by and by, expelled from Spain, and settled themselves on the coast of northern Africa, there to begin that course of piracy by which they became odious to Europe, first as a fierce retaliation against their Christian persecutors, but ultimately as a barbarous profession. As early as the time of Ferdinand the Catholic, the Spaniards sought to check their insolent ravages, and landed in Africa on several occasions, capturing the ports of Ceuta, Melilla, Oran, Bugia, the island before Algiers, and Tripoli. The Portuguese landed on the coast of Morocco, where at first they had great success, but they were ultimately compelled to leave the country. After various changes of fortune, Algiers, Tunis, and Tripoli were brought under the government of the sultan. Since 1830, however, the first of these (see ALGERIA) has been under French sway, while for many years the other two have been only nominally dependent on the Turkish ruler. A similar fate, at a much earlier period, befell the western part of B., where the successors of the Arabiah sherif, Mula-Mehemed, overthrew the kings of Morocco and Fez, and established the Sherif dynasty, which rules to the present day over these lands.—Shaw's *Travels and Observations relative to several Parts of B.;* Mauroy, *Du Commerce des Peuples de l'Afrique Septentrionale* (Par. 1845).

BARBARY APE, PIGMY APE, or MAGOT, a small species of ape or tailless monkey, interesting as the only one of the monkey-race which is found in Europe. The only European locality, however, in which it occurs is the rock of Gibraltar, and it is said to have been originally brought from the n. of Africa. It inhabits the precipitous sides of the rock, inaccessible to human foot, and enjoys a certain measure of protection from firearms in return for the amusement afforded by its manners. It is gregarious, and large numbers are often seen together, the females carrying their young upon their backs. In some parts of the n. of Africa, the B. A. is extremely abundant, inhabiting rocky mountains and woods. It displays great agility in passing from tree to tree, and its bands often plunder gardens, one of their number keeping careful watch. It feeds on fruits, roots, etc.; and its fondness for eggs is supposed to have given rise to the ancient story of the battle of the pigmies and the cranes. It is of a greenish-gray color, paler underneath; and in size resembles a large cat. The characters agree with those of the genus *macacus* (Wanderoo monkey, q.v., etc.), except that the tail is reduced to a mere tubercle. The muzzle is somewhat elongated, although not nearly so much as in the baboons, with which this ape has sometimes been classed, and the facial angle is much higher than in them. The face is almost naked, and somewhat wrinkled. The ears are in form not unlike human ears. The eyes are round, reddish, and of great vivacity. The B. A. is one of the monkeys most frequently to be seen in captivity, at least in Britain; and possessing a considerable degree of intelligence, is capable of being trained to many tricks. In order to this, however, it must be taken young, as the older ones are often sullen and mischievous. It usually walks on four feet, although it can be trained to stand or walk, in a more awkward manner, on two. It is filthy in its habits.

BARBASTELLE. See BAT.

BARBAS'TRO, a walled t. of Spain, in the province of Aragon. It is situated on the Vero, has a cathedral with some paintings by Antonio Galceran. Pop. 6500.

BAR'BAULD, ANNA LETITIA, an English authoress, was b. at Kibworth-Harcourt, in Leicestershire—where her father, the Rev. John Aikin, a dissenting clergyman, kept an academy—on the 20th June, 1743. Her private education, the religious influence of her home, and secluded life in the country were well fitted to develop early her natural taste for poetry; but it was not until 1773 that she was induced to give her effusions to the public, who appreciated them so highly that four editions were called for during the year. Encouraged by this, she the same year, conjointly with her brother, published *Miscellaneous Pieces in Prose* (Lond. 1773), which also passed through many editions.

In the following year, the poetess married the Rev. Rochemont Barbauld, a dissenting minister at Palgrave, in Suffolk, in which village the newly married pair opened a boarding-school for boys. The literary fame and the assiduity of Mrs. B. soon made it celebrated. During the ten years Mrs. B. was engaged in the duties of tuition here, she published *Early Lessons for Children*, and *Hymns in Prose*, works which have been often reprinted in England for youthful readers, and translated into several languages. Her *Devotional Pieces* was also published during this period. In 1792, she commenced with the brother previously mentioned—who wrote the most of them—the well-known series, *Evenings at Home*, which were completed in three years. In 1795, she edited Akenside's *Pleasures of Imagination*, and Collins's *Odes*, prefixing to each a critical essay. In 1804, she began to edit a selection from the *Spectator*, *Guardian*, *Tatler*, etc.; and in 1810 published a collection of the British novelists, the task of editing which she had undertaken to divert her mind from the loss she had sustained two years previous in the death of her husband. *The Female Spectator* (Lond. 1811) contains a selection from her writings. Her last poetical effort was an ode, entitled *Eighteen Hundred and Eleven* (Lond. 1812). All her compositions are characterized by simplicity of feeling, an easy, flowing style, and pure and elevated sentiment, and give token of a mind well versed in classical literature. She lived in quiet retirement till her death, which happened on the 9th Mar., 1825. The life of Mrs. B. has been written by Lucy Aikin, also known as an authoress, and prefixed to the collection of the *Works of A. L. Barbauld* (2 vols., Lond. 1825). The same lady also published from the posthumous papers of the authoress, *A Legacy for Young Ladies* (Lond. 1826).

BARBED and **CRESTED**, heraldic terms, by which the comb and gills of a cock are designated, when it is necessary to particularize them as being of a different tincture from the body. The common English term is *wattled and combed*, gules, or whatever else the tincture may be.

BARBEL, *Barbus*, a genus of fishes of the family of the *cyprinidæ* (q.v.), differing from *cyprinus* (carp, gold-fish, etc.) in the short dorsal and anal fins, in having one of the rays of the dorsal fin strong and serrated, and the mouth furnished with four soft barbules (whence the name B., from Lat. *barba*, a beard), two near the point of the snout, and one at each angle of the mouth. The upper jaw also extends considerably beyond the lower. The species are numerous. Like the other cyprinidæ, they are all inhabitants of fresh water, and generally of muddy ponds and rivers, where they seek food by plowing up the mud with their snouts, like swine, and are said often to seize the small fishes which come to share with them the worms and insects of the mud. They also feed upon the leaves and roots of aquatic plants.—The common B. (*B. vulgaris*) is abundant in many of the rivers of the temperate parts of Europe. It is the only species found in Britain, and only in some of the still and deep rivers of England. It is very abundant in the Thames, frequenting the weedy parts of the river in shoals in summer, and seeking the deeper water in winter, becoming so torpid during cold weather, that the fishermen sometimes take it with the hand, or by pushing it with a pole into a small net fastened to an iron hoop. It grows to a large size, sometimes 3 ft. in length, and 15 to 18 lbs. in weight; it is rather of a long shape, in section nearly circular: the general color of the head and upper part of the body greenish-brown, becoming yellowish-green on the sides, the belly white, the tail somewhat forked, and of a deep purple color. It affords sport to anglers, but is a very coarse fish, and little used for food, except by the poor, who often boil bacon with it to give it a relish. The larger barbels are esteemed the best. The roe has poisonous qualities, although its effects are disagreeable rather than permanently injurious.

Another species, called the binny, or B. of the Nile, is very abundant in that river; attains a very great size, 70 lbs. or upwards; is much esteemed for food; and is taken by hooks bated with dates steeped in honey. A number of baited hooks, each attached to a separate strong line, are inclosed in a mass of clay, flour, dates, etc., which is sunk in the river, and to which, as it begins to dissolve, the binnies are attracted; when boring into it with their snouts, and devouring the dates, they are caught. The fish being generally hooked by the projecting upper jaw, is allowed to remain in the water, the line being fastened on shore, and is taken out when wanted for immediate use.

BARBEL, ANGLING FOR. The B. is a ground-feeding fish, grubbing on the bottom for his sustenance. The baits principally used to capture him are worms and maggots, greaves, and cheese; and the means of angling for him are chiefly with a dead-line, called a ledger, or with float-tackle. The ledger is a perforated leaden bullet; through this the line runs freely. To prevent its slipping down on the hook, a large shot or other substance is fastened on the line, about a yard above the hook. The hook (about No. 5 or 6 in size) is baited either with a lob-worm or greaves, and the lead is cast into the water, and remains motionless on the bottom. When a fish bites, the angler feels the tug, and strikes smartly; as the fins of the B. are large, and his muscles powerful, he frequently offers considerable resistance. The rod used for ledger-fishing is short and stiff. In float-fishing for B., the tackle is finer, and the hook smaller. A cork-float suited to the depth and rapidity of the river is used, and it is fixed at such a height upon the line that the bait just touches the bottom. The instant the float disappears, the angler strikes, but not so forcibly as in ledger-fishing. Previous to angling for B., it is

desirable to bait the place to be fished, for the purpose of drawing the fish together. This is accomplished by chopping up and casting into the water from 500 to 1000 lob-worms, and it should be done 18 or 20 hours before fishing. In float-fishing for B., the float should be allowed to travel down a considerable distance of water, at least 30 or 40 yards, in order that no spot where a portion of the worms may have lodged should be missed. This is sometimes done by the use of a float called a slider, which is not fixed on the line, but, by the management of the angler, accommodates itself to the depth of the water. In this fishing, the bait trails along the ground, and the rod should be at least 14 or 15 ft. in length, and the line very light and fine. B. will sometimes take a spinning bait, and are often caught by the angler while trout-fishing; but this is by no means a certain method of angling for them. The B. may be said to be gregarious; it spawns in May or June, choosing some gentle shallow for that purpose, but soon recovers its strength again. About the end of July, the B. seeks the deep rapid streams, and may be seen vigorously springing from the water in his endeavors to rid himself of the parasitical insects which attach themselves to him during his quiescence. Here he remains the greater part of the summer and autumn. Frosty weather renders the B. torpid, and he takes shelter under some large stone or weed, where he can lie up during the winter. Although the B. is by no means an estimable fish for the table, it is much used by the Jews in their fasts and festivals.

BARBÉ-MARBOIS, François de, 1745–1837; a French statesman. He was consul-general of France for the United States, where he wedded a daughter of Wm. Moore, of Pennsylvania. In 1785, he was governor of San Domingo, where he made many reforms. In 1797 he was exiled to Guiana for political reasons, but recalled in 1801 and made minister of finance. He negotiated the sale of Louisiana to the United States, and got for it 25,000,000 francs more than Napoleon really asked, for which he was liberally rewarded. He was a member of the senate in 1813, and favored the restoration of the Bourbons, for which Louis XVIII. made him a peer of France. After the overturn of July he swore fealty to Louis Philippe. Among his works are *Reflexions sur la Colonie de Saint-Domingue, Complot d'Arnold et de Sir Henry Clinton contre les Etats-Unis d'Amerique et contre le Général Washington, De la Guyane,* and *History of the Cession of Louisiana to the United States.*

BARBER (Lat. *barba,* the beard), a shaver of the beard, and who ordinarily includes hair-cutting in his profession. Barbers are of great antiquity, if not for the shaving of the beard, at least for shaving a portion of the head. The office of the B. is referred to by the prophet Ezekiel: "And thou, son of man, take thee a barber's razor, and cause it to pass upon thine head and upon thy beard."—Ezek. v. 1. In all oriental countries, including China, the shaving the whole or part of the head continues to be performed by barbers. In every part of the world, the professional B. and hair-dresser is celebrated for his garrulity and general obliging qualities, such being required by those who place themselves in his hands. The amusing character of the B. in one of the tales in the *Arabian Nights Entertainments,* and also of the B. in Rossini's opera of *Figaro,* will readily occur to recollection. As will be seen from the succeeding article, barbers at one time acted as a kind of surgeons, and accordingly occupied a higher social position than they now enjoy. Latterly, on account of the simple mode of trimming the hair, and of the prevalence of private shaving, the business of the B. in England has greatly declined, and his services are chiefly confined to the humbler classes. In the United States, the business of the B. is almost exclusively in the hands of the colored population. Anciently, one of the utensils of the B. was a brass basin, with a semicircular gap in one side to compass a man's throat, by which means, in applying the lather to the face, the clothes were not soiled. Readers will recollect that Don Quixote crazily assumed a barber's basin as a helmet. At the end of a pole, the brass basin is still hung out as a sign at the door of the B. in Great Britain, France, and other countries.

BARBER, Francis, 1751–83; an American revolutionary colonel, graduate of the college of New Jersey, and one of Alexander Hamilton's preceptors. He volunteered when the war began, was in several engagements, was severely wounded at Monmouth, and again at Newtown. At the time of the mutiny of the Pennsylvania and New Jersey troops, B. was successful in speedily suppressing the revolt. In the autumn of 1783, on the day that he was invited by Washington to come to Newburg and hear the news of peace, B. was killed by a tree falling upon him. His brothers John and William were officers in the New Jersey line.

BARBERI'NI, the name of an Italian family who settled in Florence in the 11th c., whose members were for 500 years foremost among traders, besides figuring largely in high offices. In 1623, Maffeo B. became pope Urban VIII.; his brother Antonio and two nephews were made cardinals, and his brother Carlo general of the papal forces. Carlo was succeeded in the command by his son Taddeo, the husband of Anna Colonna. Taddeo became prefect of Rome after the death of the duke of Urbino, whose possessions were added to the papal territories. Other Italian princes became jealous of the B. family, and made war upon and defeated Taddeo's papal forces. Urban's successor, Innocent X., became hostile to the Barberini, and Taddeo fled to Paris, where he died. The principality of Palestrina still belongs to the family, and their magnificent palace and library in Rome attest their vast wealth and magnificence.

BARBERI'NO-DI-MUGEL'LO, a t. of Tuscany on the Siere, 15 m. n. of Florence, with a pop. of 5000, engaged in the manufacture of straw-hats. The royal villa of Caffegiolo, the ancient residence of the Medicis, stands in the environs.—B. Di Val-d'Elsa, a village in the same district, with a beautiful situation on the ridge between the valleys of the Pesa and Elsa, and celebrated as the place where pope Urban VIII. was born. One of the palaces of the Barberini is here.

BARBERRY, *Berberis*, a genus of plants, of the natural order *berberideæ* (q.v.). All the species, which are numerous, and found in temperate climates in most parts of the world except Australia, are shrubs with yellow flowers, having a calyx of six leaves, a corolla of six petals, and six stamens, which, when touched at the base, display a considerable degree of irritability, starting up from their ordinary position of reclining upon the petals, and closing upon the pistil apparently a provision to secure fecundation. The fruit is a berry with two or three seeds. Not a few of the species are evergreen. They are divided into two sub-genera, sometimes ranked as genera; those with simple leaves forming the sub-genus *berberis*, and those with pinnate leaves the sub-genus *mahonia*, or ash-leaved B.—The common B. (*B. vulgaris*) is a native of most of the temperate parts of Europe, Asia, and North America. It produces its flowers and fruit in pendulous racemes; has obovate, slightly serrate, deciduous leaves; and numerous straight three-forked spines. It is a very ornamental shrub, especially when covered with fruit. Its berries are of an elongate oval form; when ripe, generally of a bright red color, more rarely whitish, yellow, or almost black. They contain free malic acid. The fruit of the ordinary varieties is too acid to be eaten, but makes excellent preserves and jelly. Malic acid (q.v.) is pretty extensively prepared from it in France. A yellow fungus, *æcidium berberidis*, is very general upon the under-side of the leaves of the B.; and a notion prevails that it produces *rust* in corn, which is erroneous, the rust (q.v.) of corn being a totally different fungus, which, like this, is apt to appear in humid weather. The prevalence of this notion, however, appears to have prevented the general employment of the B. as a hedge-plant, for which it is admirably adapted, hedges made of it being easily kept free from gaps, and becoming more and more impervious by new shoots thrown up from the root. The yellow root of the B. is used for dyeing yellow, and especially the inner bark of it, and also of the stem and branches. The bark is capable of being employed for tanning leather. In like manner, *B. glauca*, *B. ilicifolia*, *B. tomentosa*, and *B. lutea* are used for dyeing in Chili and Peru; *B. tinctoria* by the inhabitants of the Neilgherry hills, and *B. aristata* in Nepaul; and a strong similarity of properties appears to pervade the whole genus. *B. lycium*, a native of the n. of India, is characterized by great astringency, and an extract prepared from it is valuable in ophthalmia. Most of the species are more or less spiny, and some of the evergreen species might be very ornamentally employed for hedge-plants; as *B. dulcis*, now frequent in shrubberies in Britain. This species, sometimes called the sweet B., is a native of the s.w. coast of America. Its leaves much resemble those of the common B.; it has solitary flowers on rather long stalks, and globose black berries about the size of a common black currant. The fruit is produced very copiously in Britain, is quite sweet when fully ripe, and makes excellent jelly. When unripe and very acid, it is used for tarts. Pleasant fruits are produced also by *B. aristata* and *B. Asiatica*, the berries of both of which are dried in Nepaul, after the manner of raisins; *B. concinna*, also a Himalayan species; *B. microphylla*, found in the southern parts of South America; and *B. trifoliata*, found in Mexico. Those of some of the other species are either disagreeable or insipid, which is particularly the case with most of the ash-leaved barberries, natives of North America and the n. of India.—Numerous species of B., both from the Himalaya and South America, are daily becoming more frequent in Britain as ornamental shrubs.

BARBER-SURGEONS. In former times, as stated in the foregoing article, barbers acted as a kind of surgeons, or at least phlebotomists, and such appears to have been the case in all countries. Till this day, on the pole on which the barber's basin is suspended, there is represented a twisted or spiral ribbon, which symbolizes the winding of a ribbon round the arm previous to blood-letting. In London, Edinburgh, and elsewhere, the B. formed corporations with certain privileges. The surgical duties of these bodies now pertain to the corporations of surgeons. The existence of B. as professors of the healing art, in England, can be traced as far back as the rign of Edward IV. in 1461, when they were first incorporated; and from thence till the reign of Henry VIII., when they were united with the surgeons, until the time of George II., when the B. ceased to be anything but barbers, as we now understand the term. In the latter reign, an act was passed, the 18 Geo. II. c. 15, from the preamble of which we learn that not till then had the discovery been made that the business or trade of a barber was "foreign to, and independent of, the practice of surgery;" and it therefore proceeds to dissolve the connection between the two bodies, and to remit the B. to the more humble functions they now perform. But this is done with an express saving of all their privileges as a company or corporation, and as such they exist to the present day. See an interesting account of them in Knight's *History of London*, vol. iii. pp. 177–192, which concludes with the following curious extract from the list of officers to Heriot's hospital in the statutes of that charity compiled in 1627: "One chirurgeon barber *who shall cut and pole the hair of all the scholars of the hospital;* and *also* look to the *cure* of all those within

the hospital who *anyway* shall stand in need of his *art*." And see the report of the royal commissioners appointed to inquire into the corporations of London, and printed in 1837, in which all particulars relating to the government and working of this company at the present day are given. The report states that the company exists "for using and exercising the art and mystery of barbers, which includes hair-dressers within the suburbs and liberties of the city;" and it concludes as follows: "The company possess extensive powers for the regulation of the trade, but in practice none are exercised except the power of compelling all persons using the trade or business of barber (which, as before mentioned, includes hair-dressers) within the city to become free of the company." The barbers still retain their ancient hall—which they possessed before the surgeons were disunited from them—in Monkwell street, Cripplegate, in the city of London. See APOTHECARIES, SURGEONS, TRADE CORPORATIONS.

BARBÈS, ARMAND, 1809–70; a French revolutionist, and leader in secret political societies, at various times imprisoned, and in 1839 sentenced to death as the main leader of an insurrection in which a lieutenant was murdered; but he was spared. While in prison he wrote *Two Days under Condemnation of Death*. In 1848, he was chosen to the constituent assembly, and in the same year, with Raspail and others, he was sentenced to life-imprisonment. When set free he refused to receive pardon, asking to be allowed to return to jail, but this was denied him, and he left the country.

BARBET, *Bucco*, a genus of birds generally placed by ornithologists in the family of the *Picidæ*, or woodpeckers (q.v.), but regarded as the type of a very distinct sub-family, exhibiting points of resemblance to the cuckoos. They have a large conical beak, surrounded with tufts of bristles directed forwards—a characteristic from which the name B. is derived (Lat. *barba*, a beard). They prey on insects, and some of them also on young birds; some are at least partially frugivorous. They inhabit warm parts both of the eastern and western hemispheres, and most of them are birds of gay plumage. The Linnæan genus has been subdivided, and includes, besides the true barbets, the barbacous (*monasa*), South American birds—the barbicans (*pogonias*) of Africa and India—the American puff-birds (*tomatia*), etc. The puff-birds are remarkable for erecting their plumage till they resemble a round ball. Being birds of short wing, both they and the true barbets wait for their prey, generally sitting with great patience on some withered branch till it comes near them, when they suddenly dart upon it. They often choose positions close to human habitations, and show little fear.

BARBETTE, an earthen terrace inside the parapet of a rampart, serving as a platform for heavy guns; it has such an elevation that the guns may be fired over the crest of the parapet instead of through the embrasures, to give them a freer scope by swiveling round into different directions.

BARBEYRAC, JEAN, 1674–1744; a French writer on law, the son of a Protestant minister expatriated by the revocation of the edict of Nantes. B. taught in Lausanne and Berlin, and was professor of international law in Groningen. His fame rests chiefly on the preface and notes to his translation of Puffendorf's *De pure Naturæ et Gentium*. He also translated Grotius' *Law in War and Peace*. Among his own works are a *History of Ancient Treatises*, and *Traité du Jeu*, in which he defends the morality of games of chance.

BARBICAN (Ital. *barbacáne*), a projecting watch-tower, or other advanced work, before the gate of a castle or fortified town. The term B. was more specially applied to the outwork intended to defend the drawbridge, which in modern fortifications is called the *tête du pont*. "To begin from without, the first member of an ancient castle was the B., a watch-tower, for the purpose of descrying an enemy at a greater distance" (Grose's *Antiquities of England and Wales*), and, to the same effect, Camden, speaking of Bedford Castle, says it was taken by four assaults; in the first was taken the B.; in the second, the *outer* balia. See BAILEY. See also Parker's *Glossary of Architecture*. There are a few perfect barbicans remaining in England, as at Alnwick and Warwick; but the best examples of it, as of the other parts of the fortification of the middle ages, are probably to be seen in the town of Carcassone (q.v.). A very curious and minute account of the siege of Carcassone in 1240, in the form of a report to queen Blanche by the seneschal who defended it, preserved in the archives of France, has been published in Hewitt's *Ancient Armour* (p. 355, *et seq.*), in which the uses of the B. are fully illustrated. The street called Barbican in London, near Aldersgate street, marks the site of such a work, in front of one of the gates of the old city.

BARBIER, ANTOINE ALEXANDRE, 1765–1825; a French librarian, who took orders as a priest, but abandoned the church for literature. He collected for the new institutions established in 1794 the books and works of art of the convents previously abolished; in 1798 he was librarian for the directory, and afterwards for Napoleon, making up the libraries of the Louvre, of Fontainebleau, and of Compiegne. Under the restoration he had charge of public libraries until 1822. B. was the author of *Nouvelle bibliotheque d'un homme de goût* and a dictionary of pseudonyms and anonymous writers.

BARBIERI, GIOVANNI FRANCESCO. See GUERCINO, *ante*.

BAR'BITON, or BAR'BITOS, a stringed instrument of the ancient Greeks, made of ivory, in the form of a lyre, with seven strings, and said to have been invented by Anacreon.

BARBOU, the name of a celebrated French family of printers, the descendants of John B. of Lyon, who lived in the 16th century. From his press issued the beautiful edition of the works of Clement Marot in 1539. His son, Hugh B., removed from Lyon to Limoges, where, among other works, his celebrated edition of *Cicero's Letters to Atticus* appeared in 1580. Joseph Gerard B., a descendant of the same family—who in the beginning of the 18th c. settled in Paris—continued in 1755 the series of Latin classics in duodecimo—rivals to the Elzevirs of an earlier date—which had been begun in 1743 by Coustelier, at the instigation of the learned Lenglet Dufresnoy. This series of classics, which is much prized for its elegance and correctness, was purchased, along with the rest of the business, by Delalain, from the heirs of Hugh B., who died in 1809. There is a complete set of the B. classics in the royal library of the British museum.

BARBOUR, a co. in s.e. Alabama, on the Chattahoochie, adjoining Georgia; 900 sq.m.; pop. '80, 34,026—20,921 colored. It is fertile, producing corn, cotton, molasses, and sweet potatoes. Co. seat, Clayton.

BARBOUR, a co. in s. Kansas, on the border of the Indian territory; 1,134 sq.m.; pop. '75, 1,388. It has an undulating prairie surface. Co. seat, Medicine Lodge.

BARBOUR, a co. in n.e. West Virginia; 330 sq.m.; pop. '70, 10,312—386 colored in '80, 11,810. It is hilly, and good for grazing; coal, iron, and salt mines are worked. Co. seat, Philippi.

BARBOUR, JAMES, 1775–1842; a lawyer, member of the Virginia legislature, 1796–1812; governor two terms; United States senator two terms; secretary of war in 1825; minister to England in 1828, but recalled by Jackson. He presided over the national convention that nominated Harrison and Tyler.

BARBOUR, JOHN, an eminent Scottish poet of the 14th c., regarding whom history has not much to record beyond the production of the national epic, entitled *The Bruce*. Nothing is known of his parentage, and of his birth it can only be conjectured to have been about 1320. The ascertained facts of his life are few. We are informed only that in his own age he was accounted a man of great learning and worth; that he was archdeacon of Aberdeen as early at least as 1357, and held that office till his death in 1395; that in 1357 he traveled into England, accompanied by three scholars, for the purpose of studying at Oxford; that he repeated his visit to England for the same purpose in 1364; that in 1365, he obtained a passport "to travel through England with six companions on horseback towards St. Denis and other sacred places;" that in 1368, he again received permission to travel through England with two servants and two horses, on his way for scholarly purposes to France; that in 1373 he was clerk of audit of the household of king Robert II., and one of the auditors of exchequer; that in 1375 his great poem was more than half finished; that in 1377 he had a gratuity of £10 from king Robert II.; that in 1378 he received from the same prince a perpetual annuity of 20s., which in 1380 he bequeathed to the dean and chapter of Aberdeen, under the condition that they should sing a yearly mass for the rest of his soul; that in 1381 he had a gift from the crown of the ward of a minor, whose estate lay within the parish of which he was rector; that in 1383, and again in 1385, he was one of the auditors of exchequer; that in 1388 king Robert II. granted him a pension of £10 a year; and that he died between Martinmas 1394 and Whitsunday 1395, probably on the 13th Mar. of the year last named, his anniversary in the cathedral of Aberdeen being celebrated on that day until the reformation. Besides *The Bruce*, B. wrote two other poems, *The Brute*, now lost, in which he recounted the origin and history of the royal house of Stuart, and *The Book of Legends of the Saints*, recently discovered in Cambridge university library. *The Bruce* is distinguished by great purity and clearness of style, the language and versification contrasting advantageously with those of any contemporary English poet, not excepting even Chaucer. His imagery is not rich, but he is seldom other than lively, simple, and energetic. He has depicted, in rough but faithful outline, the life, manners, and deeds of a truly heroic time, and given to his country the first poem in her literature, and the earliest history of her best and greatest king. *The Bruce* was first printed by Dr. Jamieson in 1820; and edited by Cosmo Innes, for the Spalding club, in 1856. The early English text society also published an edition edited by Rev. W. W. Skeat.

BARBU'DA, one of the British Caribbees, lying 30 m. to the n. of Antigua. Of its n. end, the lat. and long. are 17° 33′ n, and 61° 43′ w. Its area is estimated at 75 sq.m., and the number of its inhabitants in 1871 was 813. The proportional density, therefore, of population is only about $\frac{1}{10}$ of that of Barbadoes (q.v.). In fact, the island, small as it is, has never been cleared for cultivation, the greater part of the interior being a dense forest, interspersed with patches of savanna. The agriculture, such as it is, is confined to the rearing of stock and the growing of provisions. B. is of coral formation, and is beset with reefs. It has a roadstead, but no harbor.

BARBY, a walled t. of Prussian Saxony, on the left bank of the Elbe, 15 m. s.e. of Madgeburg. It is well built, and has an old castle. Pop. '75, 5084, chiefly engaged in the manufacture of woolens and linens.

BARCA, a country in the n. of Africa, in lat. 26° to 33° n., and long. 20° to 25° e., between the Great Syrtis (now called the gulf of Sidra) and Egypt. It forms the eastern division of Tripoli, having the rest of that dominion on the w., the Mediterranean sea on the n., the Libyan desert on the s., and it is separated from Egypt on the e. by no definite line, but by a number of roving independent tribes. It nearly corresponds with the ancient Cyrenaica (q.v.). Pop. variously estimated from 300,000 to 1,000,000. The climate is healthy and agreeable in the more elevated parts, which reach a height of about 1200 ft., and in those exposed to the sea-breeze. There are none but small streams, but the narrow terrace-like tracts of country are extremely fertile, realizing all that is said of the ancient Cyrenaica. Rice, dates, olives, saffron, etc., are produced in plenty. The pastures are excellent; the horses still celebrated, as in ancient times. But the good soil extends over only about a fourth of B.; the e. exhibits only naked rocks and loose sand. Many ruins in the north-western parts attest a former state of cultivation much superior to the present. So early as the time of Cyrus, B. became a state, which proved dangerous to the neighboring state of Cyrene; but within a single century it sank, and became subject to Egypt. In the Roman period, its inhabitants were noted for their predatory incursions. It was afterwards a province of the Greek empire, and had declared itself independent when the Arabs invaded and conquered it in 641. The present inhabitants consist of Arabs and Berbers, who profess the Mohammedan religion, and are subject to the Pasha of Tripoli, to whom each of the beys pays an annual tribute.

BARCA, or BARCE, an ancient city in Cyrenica, in the district of B., Africa, the ruins now being known as El-Medinah. It was on high ground, about 11 m. from the sea, founded by a Cyrenean colony about 554 B.C. The Persians captured and pillaged the city about 510 B.C., and many of its people were led as captives into Bactria. B. existed for several centuries after the Christian era, and appears to have risen to importance under the Arabs.

BARCA, or BARCAS, signifying "lightning," applied to Hamilcar and other Carthaginian commanders, because of the rapidity of their military movements.

BARCAROLLE', a species of song peculiar to the gondoliers of Venice. The name is applied to musical compositions for voice or pianoforte of a similar character.

BARCELLO'NA and **POZ'ZO DI GOT'TO**, two towns of Sicily, in the province of Messina, standing close together, so as really to form one t., the two parts of which are separated by a small stream, the Fiume di Castro Reale, supposed to be the Longanus of antiquity. Pop. of the two towns, 14,471. The chief street is a long street of mean houses of a single story. B. is situated in a broad plain, between the mountains and the sea, abounding in corn, wine, oil, and fruit. It is 22 m. w.s.w. from Messina.

BARCELO'NA, the most important manufacturing city in Spain, in the province of the same name, is beautifully situated on the Mediterranean between the mouths of the Llobregat and the Besos, in the midst of a district as luxuriant as a garden. It is walled, and possessed of a citadel, which, however, is effectually commanded by the fortress of Montjouy on the southwest. B., like Edinburgh, is divided into two parts—the old town and the new—by the *rambla* (river-bed), which has been planted with flowering shrubs, and formed into a beautiful promenade. The streets of the old town, forming the n.w. division, are crooked, narrow, and ill-paved. Those of the new are much more spacious and regular. There is a large suburb to the e. of the town, where the seafaring portion of the population chiefly reside. In 1864, the pop. was 190,000; but in 1868 it had been reduced to 167,095; chiefly by a frightful cholera epidemic in 1865. B. is the see of a bishop. It has a university, and colleges and schools for general and special educational purposes; public libraries, in one of which there is a splendid collection of MSS.; several hospitals and other charitable institutions; the finest theater in Spain; and numerous ancient and elegant churches, with a cathedral which, begun in 1298, is not yet completed. B. manufactures silk, woolens, cottons, lace, hats, firearms, etc., which form its principal exports. It imports raw cotton, coffee, cocoa, sugar, and other colonial produce: also Baltic timber, salt-fish, hides, iron, wax, etc. Next to Cadiz, it is the most important port in Spain. In 1872, between 700 and 800 foreign vessels, with a tonnage of 360,000 tons, discharged their cargoes in the port. The harbor was extended and its entrance improved in 1875. The imports in 1874 amounted to £1,943,310, and the exports to about £300,000. B. is a place of great antiquity, and associated with many historical events. Local tradition fixes the date of its foundation 400 years before the Romans; and it is said to have been refounded by Amilcar Barca, the father of Hannibal, from whom its ancient name, Barcino, was derived. An important city under the Romans, Goths, and Moors, B. in 878 became an independent sovereignty, under a Christian chief of its own, whose descendants continued to govern it, and to hold the title of counts of Barcelona until the 12th c., when its ruler adopted the title of king of Aragon, to which kingdom it was annexed. During the middle ages, B. became a flourishing seaport, rivaled in the Mediterranean by Genoa only. To its commercial code, framed in the 13th c., much deference was paid by the whole of Europe; and it was at this time, says Ford in his *Handbook of Spain*, "a city of commerce, conquest, and courtiers; of taste, learning, and luxury; and the Athens of the troubadour." Columbus was received here in 1493 by Ferdinand and Isabella after his discovery of America. In

1640, it appealed to France against the tyranny of Philip IV.; but it turned against that country in the war of the Spanish succession, and adhered to Austria. In 1705, the fortress of Montjouy was surprised and captured by lord Peterborough, and the city surrendered shortly afterwards. In 1714, after a most heroic defense, it was stormed by the duke of Berwick, and given over to fire and sword. Napoleon perfidiously obtained possession of it in 1808; and with one or two reverses, and in the face of great difficulties, it was held by the French until the treaty of peace concluded in Paris in 1814. For 13 years, B. remained quiet under the iron rule of España; but in 1827 its old turbulent spirit returned, and it rose in favor of Don Carlos. Since that time, B. has generally supported the government. But a progressist rebellion in 1856 caused much bloodshed, and in 1874 the federalists raised an insurrection here.—The province of B. has an area of 2950 sq.m., and a pop. of (1870) 762,555.

BARCELO'NA, a state or department of Venezuela, between the Caribbean sea and the Orinoco; 13,812 sq.m.; pop. '73, 101,396. Besides many cattle, it produces coffee, cocoa, cotton, cane, corn, and tropical fruits.

BARCELO'NA, formerly NEW B., the capital of the state of B. on the Neveri, near the ocean, 160 m. e. of Caraccas; pop. 7644. The city is dirty and unhealthy, yet has considerable export trade in hides, cattle, indigo, cotton, etc.

BARCLAY, ALEXANDER, a poet and prose writer, b. about the end of the 15th c., whether in England or Scotland is not certain. He studied at Oxford, and then obtained through his patron, bishop Cornish, an appointment as one of the priests or prebendaries of St. Mary Ottery, in Devonshire. He afterwards became a monk of the Benedictine monastery of Ely, where he continued until its suppression in 1539. He d. in June, 1552, six weeks after he had been presented to the rectory of All-Hallows, London. His claim to notice rests chiefly upon his famous poem, *The Shyp of Folys of the Worlde*—partly a translation, and partly an imitation of the German *Narrenschiff* by Brandt—printed by Pynson in 1509, and since often reprinted (best edition by T. H. Jamieson, 1874.) It is interesting as showing the manners and customs of the times satirized. He published several works besides; amongst others, *The Myrrour of Good Manners*, *The Castell of Labour*, *The Egloges*, the first eclogues that appeared in the English language; and also made a translation of Sallust's *History of the Jugurthine War*. In his lifetime, he was admired for his wit and eloquence, and his writings exhibit a refinement not common in that age.

BARCLAY, JOHN, a clever poet and satirist, was b. about 1582, at Pont-à-Mousson in Lorraine, where his father, William B., a Scotsman, who d. in 1605, had held the office of professor of law. He studied in the Jesuit college of that place; and the distinguished talents which he early displayed, caused the Jesuits to try to induce him to enter their order. On account of his rejection of their proposals, he, as well as his father, suffered much persecution. He accompanied his father to England in 1603, where he soon attracted the attention of James I., to whom he dedicated one of his works, *Euphormionis Satyricon* (Lond. 1603), a politico-satirical romance, chiefly directed against the Jesuits. Next appeared his *Conspiratio Anglicana* (Lond. 1605), and his *Icon Animarum* (Lond. 1614). In 1615, he left England, and went to Rome, where he d. Aug. 12, 1621. In the same year his celebrated work *Argênis* appeared in Paris (Paris, 1621). It was written in Latin, and has been translated into several languages. There are no fewer than three translations into English; the last appeared in 1772. It is a political allegory, containing clever allusions to the state of Europe, more particularly of France, during the time of the league. *Argênis* was admired both by Cowper and D'Israeli.

BARCLAY, JOHN, 1734–98; the founder of a small sect in the Scotch church called Bereans, or Barclayites. He was assistant minister at Fettercairn, where he attracted crowds by his novel doctrine; the presbytery disapproving refused him the usual testimonials, and he was dismissed from his position. The general assembly sustained the presbytery, whereupon B. left the church, but continued to preach in Edinburgh, London, and other cities, but with no great success. The Bereans claim to found their system upon the gospel alone, without reference to human authority. As a sect they are not important in number or influence.

BARCLAY, JOHN, M.D., lecturer on anatomy in Edinburgh, and eminent for his attainments both in human and comparative anatomy, in physiology, and in other branches of natural science, was b. Dec. 10, 1758, at Cairn, near Drummaquhance, in Perthshire, Scotland, and was educated at the parish school of Muthil, and afterwards at the university of St. Andrews. He studied for the ministry of the church of Scotland, and was licensed as a preacher, but afterwards devoted himself to the profession of medicine, and particularly to the study of anatomy. He obtained the degree of M.D. from the university of Edinburgh in 1796. After spending a year in London, he became a private lecturer on Human and Comparative Anatomy in Edinburgh. He published in 1803, *A New Anatomical Nomenclature;* and in 1808, a treatise on the *Muscular Motions of the Human Body*. In 1812, appeared his *Description of the Arteries of the Human Body*, a work of vast labor and accurate observation. In 1825, not long before his death, he published *An Inquiry into the Opin-*

tions, Ancient and Modern, concerning Life and Organization. He d. at Edinburgh on 21st Aug., 1826, leaving to the royal college of surgeons in Edinburgh his admirable anatomical collection, for the reception of which a suitable and splendid hall was erected.

BARCLAY, ROBERT, the celebrated apologist of the Quakers, was born on Dec. 23, 1648, at Gordonstown in Morayshire, Scotland. His father was the son of David Barclay of Mathers, the representative of an old Scoto-Norman family, which traced itself through 15 intervening generations to Walter de Berkeley, who acquired a settlement in Scotland about the middle of the 12th c.; his mother was the daughter of sir Robert Gordon, the premier baronet of Nova Scotia, and historian of the house of Sutherland. Young B. received the rudiments of learning in his native country, and was afterwards sent to the Scotch college at Paris, of which his uncle was rector. Here he made rapid progress in his studies, and excited the admiration of his preceptors, as well as of his relative, who offered to make him his heir, if he would remain in France, and formally adopt the Roman Catholic religion, to the ceremonies of which he had been habituated during his residence there. This, however, B. refused to do; and in compliance with the wish which his mother had expressed on her death-bed, he returned home in 1664. Though only 16, B. was an excellent scholar, and could speak in the Latin language with wonderful fluency and correctness. In 1667, he embraced the principles of the society of Friends, for reasons more highly respected in our day than in his. He states in his *Treatise on Universal Love*, that his "first education fell among the strictest sort of Calvinists," those of his country "surpassing in the heat of zeal not only Geneva, from whence they derive their pedigree, but all the other so-called reformed churches;" that shortly afterwards, his transition to France had thrown him among the opposite "sect of Papists," whom, after a time, he found to be no less deficient in charity than the other; and that, consequently, he had refrained from joining any, though he had listened to several. The ultimate effect of this was to liberalize his mind, by convincing him of the folly and wickedness of religious strife. In both Calvinists and Catholics, he found an absence of "the principles of love," "a straitness of doctrine," and a "practice of persecution," which offended his idea of Christianity, as well as his gentle and generous nature. He therefore allied himself gladly to this new sect, whose distinguishing feature was its charity and pure simplicity of Christian life, and soon became one of its most devoted adherents and its ablest advocate. In the course of his life he made several excursions into England, Holland, and Germany, earnestly propagating his peaceful views wherever he went, and occasionally enjoying the companionship of William Penn. His first publication was *Truth Cleared of Calumnies.* It appeared in 1670, and was intended as a refutation of the charges—many of them notoriously false—made against the new sect. In 1673 appeared *A Catechism and Confession of Faith*, the answers to the questions being—to avoid theological dogmatism—in the words of Scripture. This was followed by *The Anarchy of the Ranters*, etc. In 1675, he published his *magnum opus*, elaborately entitled *An Apology for the True Christian Divinity, as the same is held forth and Preached by the People called in scorn Quakers: Being a full Explanation*, etc. It contains a statement and defense of 15 religious propositions peculiar to the Friends. The leading doctrine which runs through the whole book is, that divine truth is made known to us not by logical investigation, but by intuition or immediate revelation; and that the faculty, if it can be technically defined, by which such intuition is rendered possible, is the "internal light," the source of which is God, or, more properly, Christ, "who is the light that lighteth every man that cometh into the world." The identity of this doctrine with that held by Mr. Maurice and others of the Broad church in the present day has been more than once remarked. In 1677 appeared his *Treatise on Universal Love.* It was the first of that long series of noble and gentle remonstrances against the criminality of war that has so honorably distinguished the society of Friends. It was addressed to the ambassadors of the several princes of Europe, met at Nimeguen. In 1686, he published his last work, which was a defense of the doctrine of "immediate revelation." He died at Ury, in Kincardineshire, Oct. 3, 1690. His estate remained in the possession of his descendants till 1854, its owner at that time being captain Barclay, the famous pedestrian. "The Apologist's Study," which remained much as he left it, was long an object of pilgrimage with members of the society of Friends; it was destroyed a few years ago, when the old house of Ury was pulled down.

BARCLAY, WILLIAM, LL.D., 1541–1605; a Scotch writer on law. He studied in France, under the famous Cujas; became professor of civil law in the university of Pont-à-Mousson, and was made councilor of state by the duke of Lorraine. He married a French lady, and their son John became celebrated as the author of the *Argenis.* This boy the Jesuits desired to educate, but the father opposed it, which roused the enmity of the Jesuits so that B. was compelled to leave France. King James offered him preferment if he would join the church of England, but he refused and returned to France, becoming professor in the university of Angers. He was the author of a number of important works on law.

BARCLAY AND PERKINS'S BREWERY, one of the largest establishments of the kind in the world, is situated in Park street, Southwark, London, the buildings covering upwards of ten acres. The brewery was founded by Dr. Johnson's friend, Henry Thrale, who, in 1773, according to a statement made by the doctor on his

Hebridean tour, was paying as much as £20,000 annually to the excise. After Thrale's death, it was sold by the executors to Barclay (a descendant of the author of the *Apology for the Quakers*), and Perkins, who had been Thrale's chief clerk, for £135,000. So far back as the year 1841, when described in Dodd's *Visits to Factories*, this great establishment had 24 malt-bins, each as large as a three-storied house; a brewing-room nearly as large as Westminster hall; 10 coppers averaging 120,000 gallons capacity each; 4 fermenting vessels of 1500 barrels capacity each; a cooling-floor of 1000 sq. yards area; 300 yeast-working vessels of 300 gallons capacity each; and 150 store-vats, one large enough to contain 100,000 gallons. The operations consumed 2000 quarters of malt and 600,000 gallons of water weekly; while the carting of the beer employed 200 horses and drays. These quantities must have greatly increased since; for although there has been a vast increase of population since 1841 in the metropolis, the number of porter breweries (of which those of Barclay & Perkins, and Truman & Hanbury, are the chief) remains nearly uniform.

BARCLAY, or BARCLAY-ALLARDICE, ROBERT, 1779–1854; a captain in the British army, and a descendant of Barclay of Ury; noted as a pedestrian, at his greatest effort walking 1000 m. in 1000 consecutive hours. In later life he was a breeder of cattle and sheep.

BARCLAY DE TOL'LY, MICHAEL, Prince, one of the most distinguished Russian generals, was descended from a branch of the same Scotch family to which the two preceding—Barclay the poet and the apologist of the Quakers—belonged, some of whom had settled in Mecklenburg and Livonia. He was the youngest of three brothers, and was b. in 1759 in Livonia, where his father, Gottlieb B. de T.—at one time a member of the town-council of Riga—possessed an estate. Having been adopted by gen. van Vermoulen, B. de T. entered a Russian regiment of cuirassiers, at first with the rank of sergeant. He fought with great bravery in the Turkish war of 1788–89; in the campaign against Sweden in 1790; and in those against Poland in 1792 and 1794. In the year 1806, at Pultusk, as maj. gen., he commanded Benningsen's advanced-guard. He lost an arm at the battle of Eylau. Although much hated by the Russian national party, because regarded by them as a German, he was appointed minister of war by the emperor Alexander in 1810—an office which he held till 1813. In 1818, he was made commander-in-chief of the army of the west. His retreat to Smolensko, and the loss of the battle fought there on the 17th of Aug., raised the hatred of the Russian national party to a greater height than ever, and he was obliged to yield the chief command to Kutusow. It has been maintained by many, that B. de T. was the originator of the Russian system of defense in 1812. He had indeed advised a retreat to the interior, and recommended the avoidance of a battle; but the system of defense, as a whole, originated with gen. Pfuel, who had left the Prussian service, and constantly accompanied the emperor Alexander from the year 1807, without holding any distinct official appointment. At Moskwa, B. de T. commanded the right wing. After the death of Kutusow, he again obtained the chief command of the army, which he held at the battle of Bautzen, and retained till the truce. He afterwards commanded the Russian army in Bohemia, and took part in the battles of Dresden, Culm, and Leipsic. He was commander-in-chief of the Russian army in France, and in consequence of this was made a prince and a field-marshal. He died in 1818 at Insterburg, on his way to the Bohemian baths. Two or three years before his death, the estate of Tolly or Towie, in Aberdeenshire, the old inheritance of his family, was for sale, and he was pressed to buy it, but refused, on the ground that his family had been so long expatriated that Scotland was now to them a strange country.

BAR-COCH'BA, SIMON, the leader of the Jews in their great insurrection against the Romans, under the emperor Hadrian, from 131 to 135 A.D. Three times had the oppressed Jews revolted without success, from 115 to 118; and in 130, soon after Hadrian's return from Syria, a new rebellion broke out, for which they had been secretly preparing. At the head of it was one Simon, who assumed the name of Bar-cochba, i.e., "son of the star," pretending that the prophecy was to be fulfilled in him, "There shall come a star out of Jacob" (Numb. xxiv. 17). He fought at first with great success against the Romans, and even obliged them to evacuate Jerusalem, where he was proclaimed king, and caused coins to be struck with his name. The war spread over all the country of Palestine, and fifty towns, besides many villages and hamlets, came into the possession of the Jews. But on the arrival of Hadrian's general, Julius Severus, Jerusalem was retaken; and in August, 135, Bether, the very last strong fortress held by the Jews, was stormed by the Romans. B. fell on the day of this bloody conquest. During the war, hundreds of thousands of Jews were destroyed, many were executed, and very cruel edicts were subsequently issued against them. From this last struggle dates the final dispersion of the Jews over the face of the earth. The holy city was razed to the ground, and rebuilt under another name. The Jews still retain in their liturgy hymns which they chant in mournful memory of this tragic event. For a particular history of the struggle, see Münter's *Der Jüdische Krieg unter den Kaisern Trajan und Hadrian* (Altona, 1821).

BARD, the name known to the Romans since 200 B.C., by which the Gauls and other Celtic peoples (British, Welsh, Irish, and Scotch) designated their minstrels. Like the

Scôps of the Anglo-Saxons, and the Scalds of Scandinavia, the bards celebrated the deeds of gods and heroes at religious solemnities, and the festivities of princes and nobles, accompanying their recitations with the harp or chrotta (Ir. *cruit* and *clarseach*); they excited the armies to bravery, preceded them into the fight, and formed the heralds of princes, and the mediators of peace. The institution early disappeared among the Gauls, but lingered long in Wales, Ireland, and Scotland. The bards formed a hereditary order, and exercised a decided national influence. The minstrels among the Celts, as among the Germans, were the organ of the people, and the channel of all historical tradition. It is supposed that in Wales, about 940 A.D., their privileges were defined and fixed by the laws which bear the name of king Howel Dha; and in 1078 the whole order is said to have been reformed and regulated anew by Gryffith ap Conan. At Caerwys, Aberfraw, and Mathraval, there were held from time to time great competitions in minstrelsy, called eisteddfods, at which the judges were appointed by the prince. When Wales was conquered by Edward I. (1284), the bards lost their privileges, and were, according to tradition, persecuted and put to death; but succeeding princes countenanced the institution, and eisteddfods were repeatedly held under royal commission down to the reign of Elizabeth. Since then, exertions for the revival of national Welsh poetry and the bardic profession have been made by several societies: the Gwyneddigion, founded in 1770; the Cambrian, in 1818; and more recently, the Metropolitan Cambrian institution. To these societies, and to the patriotism of individuals, we owe collections of the relics of the lays of the Welsh bards, none of which, it should be added, can be traced to MSS. of an older date than the 12th century. The most interesting of those relics are those of Liwarc'h-Henn, Aneurin, and Taliesin. See Jones's *Relics of the Welsh Bards*, (1794); Owen's *Myvyrian Archæology of Wales* (3 vols., 1801–7); *Poèmes des Bardes Bretons du vi^e^ Siècle, par T. H. de la Villemarqué* (Paris, 1850), etc. See WELSH LANGUAGE AND LITERATURE.

In Ireland, the bards are believed to have been a hereditary guild, divided into three classes: the Filedha, who sung in the service of religion, and in war, and were the counselors and heralds of princes; the Braitheamhain, who recited or chanted the laws; the Seanachaidhe, who were chroniclers and genealogists to princes and nobles. Their ample privileges and endowments of land gave them an exorbitant influence, which both princes and people had sometimes to rise against and curb. The great skill of the Irish bards on the harp was acknowledged everywhere. After the conquest of Ireland by Henry II., the profession began to sink. Still many of the chiefs maintained bards in their families, whose songs and legends kept up the national feeling. This occasioned several measures of the English rulers against the Irish bards; Elizabeth ordered the bards that were captured to be hanged, as the instigators of rebellion. Turlogh O'Carolan, b. 1670, d. 1737, is reckoned the last Irish bard; his poems were translated into English by Furlory. Other lays of the bards have been translated by Miss Brook, *Relics of Irish Poetry* (Dub., 1789), and Hardiman, *Irish Minstrelsy* (Dub., 1831).

The bardism of Scotland may be conjectured to have been similar to that of Ireland; but nothing is certainly known of the subject beyond the fact that there were poets or bards, of different degrees, in the highlands down to the 17th century.

The name of B. was unknown among the Germanic nations; though a corrupt reading in some MSS. of the *Germania* of Tacitus (*barditus* for *baritus*, the "war-cry") led Klopstock and others to write wild religious and war songs, which they called "bardits," under the notion that they were restoring a branch of the national literature. This Ossianic aberration soon came to an end.

BARD, a fortress and village of Piedmont, situated on the left bank of the Doire, about 23 m. s. s.e. of Aosta. When the French crossed the St. Bernard in 1800, the fortress of B. offered a resistance to their further advance into Italy, which might have proved effectual had the Austrian garrison been sufficiently on the alert. The French failed to take the fortress by storm, but they succeeded in dragging their artillery under and past the guns of the fort during the night, and were far on the road to Ivrea before the Austrian commander was aware that they had passed. B. was taken a short time after by the French, and razed, but it has since been restored. Pop. about 550.

BARD, JOHN, 1716–99; b. Penn.; a physician, and first president of the medical society. He established the first quarantine on Bedloe's island, in New York harbor.

BARD, SAMUEL, LL.D., 1742–1821; b. Philadelphia; son of Dr. John; studied in Columbia college and the Edinburgh medical school; organized the medical school of Columbia college, and became dean of the faculty. While the federal government was in New York he was Washington's family physician. In 1813, he was president of the college of physicians and surgeons.

BARDESA'NES (properly Bar-Deisan), the founder of a Gnostic sect, was a native of Edessa, in Mesopotamia, and flourished towards the end of the 2d century. He stood high in favor with the monarch Abgar-bar-Maanu, but little is known regarding him. It is stated that he held a disputation with the philosopher Apollonius, who appeared in Edessa in 165 A.D., in the suite of L. Antonius Verus. He was first a disciple of Valentinus, whose heresy he afterwards abjured, and wrote against it, and also against other heresies; but ultimately he relapsed into partial agreement with his old master. His *Gnosis* was not purely dualistic. He did not consider evil the eternal coefficient of

good, but merely the result of a temporary reaction of matter on spirit. Yet, inexplicably enough, he maintained the devil to be a self-existent, independent being. He denied the doctrine of the resurrection of the body, and, in conformity with such a conviction, asserted that Christ's body was not real, but only an illusive image brought down from heaven. He diffused his opinions through the medium of hymns, of which he is reckoned the first writer in Syria. These hymns, fragments of which are still extant, exhibit a rich and pure fancy. His followers were called *Bardesanists*. They never formally separated themselves from the orthodox church, though they continued to exist as late as the 5th century. See Hahn's *B. Gnosticus Syrorum primus Hymnologus* (Leip., 1819).

BARDI, a small t. of Italy, on the left bank of the Ceno, 31 m. w.s.w. from Parma, in the province of Piacenza. The town is commanded by a castle, situated on a hill, erected in the 9th century. In the vicinity are noble forests of chestnut, beech, and oak. B. was formerly the capital of the duchy of Bardi.

BARDINGS, or BARD, such parts of horse-armor as protect the animal's head, neck, and rump; the "champfront," the "manifaire," the "poitrel," and the "croupier."

BARDOLI'NO, a t. of northern Italy, with a harbor on lake Garda, and about 14 m. w. from the fortress of Verona. The battle of Rivoli was fought in its vicinity in Jan., 1797.

BARDSTOWN, or BAIRDSTOWN, the seat of justice of Nelson co., Ky.; 40 m. s.e. of Louisville, on a branch of the Louisville and Nashville railroad; pop. '70, 1835. It is the seat of St. Joseph's (Roman Catholic) seminary and college, a college for women, an academy, and several important manufacturing establishments.

BAREBONES, or BARBONE, PRAISE GOD, a London tanner and fanatical member of the parliament of 1653, which became known by his name. After a short imprisonment at the restoration he was lost sight of.

BAREFOOTED (Lat. *discalceati*, i.e., shoeless), an appellation given to certain monks and nuns who abstain from wearing any covering on the feet, either entirely (as the Alcantarines, who originated at Placentia, in Spain, in 1540, but who are chiefly found at present in the kingdom of Naples), or for a specified period of the year (as the nuns of our Lady of Calvary); or who, instead of shoes, wear merely sandals, i.e., soles of wood, leather, rope, or straw fastened by thongs. They do not constitute a separate order in the Roman Catholic church, but are to be found as a higher grade of asceticism with more or less severity of observance, among most of the orders, Carmelites, Franciscans, Augustines, Eremites, Capuchins, etc. They are, however, steadily ignored by the more dignified Dominicans, though the latter are themselves mendicant friars. The origin of this form of religious austerity is to be traced generally to the custom which prevailed among the Jews and Romans of putting off their shoes on the occurrence of public calamities, that in this condition of mourning and humiliation they might implore the Divine Being for deliverance; but perhaps more particularly to the command which Christ gave his disciples (Matt. x. 10; Luke x. 4).

BARÈGES, a small watering-place in France, situated in the Pyrenees, about 18 m. from Bagnères de Bigorre. The mineral water for which it is celebrated contains principally sulphuret of sodium, with portions of carbonate, muriate, and sulphate of soda, nitrogen, and sulphureted hydrogen. Its efficacy in the cure of wounds, rheumatism, stiffness of joints, and scrofulous complaints is said to very remarkable. See Murray's *Hand-Book to France*.

BAREGES, mixed tissues adapted for women's dresses, called in France *crêpe de barèges*. The name is derived from the place noticed in the above article; in reality, however, B. were never made in that little watering-place, the seat of the manufacture being at Bagnères de Bigorre. B. are usually a mixture of silk and worsted; an inferior kind being composed of cotton and worsted. They vary in color, and are sometimes light in tint, with printed patterns. All are of a slight fabric for summer wear. The best are still manufactured in France.

BAREGINE. Many algæ are found growing in mineral springs, especially those of a sulphuric nature. The product of their growth is a mucus-like substance somewhat resembling the white or glair of an egg. This deposit is particularly abundant in the hot springs at Barèges, whence the name of baregine. It imparts a flesh-broth flavor and odor to the water, which is prized, and is sometimes imitated by adding animal gelatine to the sulphur baths where B. is deficient.

BAREILLY, the chief city of a district of the same name in Rohilcund, British India —a district which, with an area of 2982 sq. m., contains (1872) 1,507,139 inhabitants, and which is bounded on the e. by Oude and Nepaul. The city itself, with a pop. of 102,982 (1872), is in lat. 28° 23′ n., and long. 79° 28′ e., being 788 m. n.w. of Calcutta, and 152 m. e. of Delhi. It is pleasantly situated in a well-wooded country on the left bank of the Jooa, an affluent of the western Ramgunga. Besides a brisk and lucrative commerce, it has considerable manufactures, more particularly in the article of ornamental chairs and tables. It is the seat of a college attended by more than 300 students. B. became a name of notoriety in the great mutiny of 1857. On the 31st of May the city

was a scene of rapine and bloodshed. The native garrison, without any European troops to overawe them, rose against their officers and seized the public treasure. They murdered every European who had not the means of escaping. But fortunately, from a suspicion of the outbreak, the ladies and children of the company's servants, both civil and military, had previously been sent off in safety. B. was recovered by Sir Colin Campbell, afterwards lord Clyde, in May, 1858.

BARENTZ, WILLEM, one of the early explorers of the northern ocean; sailed from Holland in June, 1594, to find a n.e. route to China; explored a great part of Nova Zembla and returned. Next year he sailed with seven vessels laden with rich goods for eastern trade, but too late in the season to succeed. In May, 1596, he went as pilot of two ships sent out by the city of Amsterdam; at Spitzbergen the ships separated, and B. guided his own around Nova Zembla until frozen in at Ice Haven, Sept. 1, where they passed the winter in great misery, the sun being below the horizon 81 days. June 14, 1597, those who survived started in open boats for the mainland; B. died the second day; the others reached Lapland, where they found the other vessel, and were rescued. Interesting relics of B.'s expedition have recently been discovered.

BARE POLES. A ship with all her sails furled, either scudding before the wind or lying-to from stress of weather, is said to be "under bare poles."

BARÈRE DE VIEUZAC, BERTRAND, a member of the French national convention, b. at Tarbes, 10th Sept., 1755. He became an advocate in the court at Toulouse. After acting as a deputy in the national assembly, the department of the Hautes-Pyrénées elected him to the national convention in 1792. He is said to have been naturally in favor of moderate measures, but he was easily overawed by the influence of the party of the mountain, with whom he generally acted and whom he supported by his eloquence, which was so flowery and poetical in style that he came to be designated the Anacreon of the guillotine. He was president of the convention when the sentence was passed upon Louis XVI. He rejected the appeal to the people, and gave his vote with these words: "The law is for death, and I am here only as the organ of the law." His natural mildness, warring with the instinct of self-preservation, made him alternately a supporter of merciful measures and an advocate of the guillotine, and his whole public conduct betokens a man much more selfish than patriotic or humane. After the death of Robespierre, in which he had concurred, B. nevertheless proposed the continuation of the revolutionary tribunal, for which he was denounced by Lecointre and afterwards impeached and sentenced to transportation; his sentence, however, was not carried into effect, and he partook of the general amnesty of the 18th Brumaire. He was elected as a deputy to the chamber in 1815, during the hundred days. After the second restoration he was banished from France and went to Brussels, where he devoted himself to literary work till the revolution of July permitted his return. In the year 1832 he was once more elected as a deputy by the department of the Hautes-Pyrénées; his election, however, was annulled, on account of errors of form, whereupon the government called him to be a member of the administration of that department, which office he continued to hold till 1840. He died on 14th Jan., 1841. He bestowed upon the younger Carnot his *Mémoires*, which have been published (2 vols. Par. 1842). His many other political and historical writings are now of no importance.

BARETTI, JOSEPH, an Italian writer, b. at Turin, 1716. He was intended for the law, but devoted himself to literature. In 1751, he established himself as a teacher of Italian in London, where, in 1757, he published the *Italian Library*, giving an account of the most eminent Italian authors and their works. He was about this time appointed secretary for the foreign correspondence of the Royal Academy. In 1762, he published an account of his travels through Portugal, Spain, and the s. of France to Italy in *Lettere Famigliari*, which, with additions and a new title, were afterwards republished in England. B. now lived some time in Italy, and published at Venice a journal called the *Literary Scourge*, which brought upon him many prosecutions. On his return to England, he published, among other works, an Italian grammar, and an Italian and English dictionary, which have since gone through many editions. One evening, he became involved in a street-brawl in London, and stabbed with his penknife a man, who died soon after. B. was tried for murder, made his own defense, and was acquitted—Dr. Johnson, Burke, and Garrick testifying to the excellence of his character. He died in 1789 in London.

BARFLEUR, a seaport t. of France, in the department of La Manche, about 15 m. e. of Cherbourg. It is now a place of little importance, but it is noteworthy as being the port from whence, according to report, William the Conqueror set out on his invasion of England. In the 13th and 14th centuries, B. was twice pillaged by the English.

BARGA, or BARGA DE GARFAGNANA, a t. of Italy, in the province of Lucca, 25 m. n.n.e. from Pisa, near the left bank of the Serchio. B. has a fine collegiate church, and is celebrated for its gunpowder manufactories. The sides of the neighboring mountains are covered with noble chestnut forests.

BARGAIN AND SALE, in the law of England, is a mode of conveyance whereby property, real and personal, may be assigned or transferred for valuable consideration. It finds a chief place, however, in law-books in connection with the conveyance of *real*

estate. In regard to personal estate, *assignment* (q.v.) appears to be the more appropriate, as it is the more usual term. B. and S., then, may be described as a conveyance, in the way of a real contract, by means of which property in lands and tenements, whether that property be in possession, remainder, or reversion, is conveyed from one person to another. In its terms, it consists of a B. and S. by the seller to the intended vendee for money; and by the statute of frauds, 29 Chas. II., c. 3, it must be in *writing;* and by the statute of enrollments, the 27 Hen. VIII. c. 16, it cannot pass a freehold, unless it be by *indenture enrolled* within six months after its date, or with a *custos rotulorum* of the county. But hereditaments lying within any city or town corporate, the officers of which have authority to make enrollment of deeds, are excepted from this statute. A B. and S. for a term of years, however, will be effectual without enrollment. But see LEASE and RELEASE.

No particular form of words is essential to the validity of a B. and S.; "bargain and sell" are the words of transfer ordinarily used. But other words will have the same effect, and the distinctive character of the conveyance is determined by the consideration on which it is founded. This consideration, however, is held to be a mere matter of form, and sufficiently complied with if the conveyance purport to be so founded. To this end, any trivial sum may be inserted in the conveyance, though the consideration which really passes between the parties be of larger amount; or even though it be, in fact, not of a pecuniary nature. It is also immaterial whether the sum so inserted be actually paid or not.—Stephen's *Commentaries*, vol. i., pp. 535–537. See CUSTOS ROTULORUM, POSSESSION OF PROPERTY, REMAINDER, REVERSION, INDENTURE, LEASE, and RELEASE.

There is no such title to land or other real estate in the Scotch law, but in that system there may be a *bargain* as to land, the evidence of which must be in writing, the Scotch law in this respect agreeing with the regulations of the English statute of frauds above referred to. The term bargain is also used by Scotch lawyers to signify a contract or agreement for the sale of personal or movable property, and to such a bargain the intervention of writing is not necessary, but it may be proved by witnesses.

BARGA PASS, in the Himalaya, in n. lat. 31° 16′, e. long. 78° 19′, the highest part of it about 15,000 ft. above the sea.

BARGE, an ancient t. of Piedmont, in the province of Cuneo, 30 m. s.w. of Turin. Pop. '71, 2429, who are engaged in the manufacture of fire-arms and the quarrying of slate. A brisk general trade is also carried on.

BARGE. Various forms of vessel receive this appellation. The admiralty and city of London barges, used on ceremonial occasions, are elegantly fitted out, and supplied with accommodation for many rowers. The B. belonging to a man-of-war, for the occasional use of the superior officers, is a well trimmed, though not showy boat, light enough to be easily hoisted in and out of the ship. On our rivers and canals, a B. is a clumsy, flat-bottomed vessel of burden, employed either in conveying goods from one town or quay to another, and to aid in bringing stores to and from ships. There are several kinds of this last-named craft—namely, coal-barges, sand-barges, west-country barges, etc. For the chief points of difference between barges and other boats, see BOAT.

BARGE-BOARD. Where the roof, in Gothic houses, extends over the wall, the gable is generally furnished with a board, which either covers the rafter, or occupies the place of a rafter itself. These B.-B. were often very richly ornamented, particularly in the 14th and 15th centuries. The accompanying illustration is copied from *Parker's Glossary of Architecture.*

BARHAM, RICHARD HARRIS, 1768–1845; an English humorist known as "Thomas Ingoldsby." He began to study law, left it for the church, and was ordained in 1813. In 1821, he was appointed minor canon of St. Paul's, London, and three years later became one of the priests in ordinary of his majesty's chapel royal. In 1837, he began in *Bentley's Magazine* the grotesque *Ingoldsby Legends*, which gave him immediate and enduring fame as a humorous writer, one with scarcely a rival since Butler wrote *Hudibras.* Yet his life was grave and dignified, and he was held in high honor. Though a tory in politics, he was the life-long friend of Sydney Smith, the prominent liberal; and Theodore Hook was also among his friends. He published one novel, *My Cousin Nicholas*, and contributed largely to the *Edinburgh Review* and the *Literary Gazette*, besides furnishing a third of the articles for a large biographical dictionary. "His sound judgment and kind heart made him the trusted counselor, the valued friend, and the frequent peace maker; and he was intolerant of all that was mean, base, and false."

BARI (ancient *Barium*), a city in the kingdom of Italy, capital of a province of the same name, is situated on a peninsula in the Adriatic, in lat. 41° 8′ n., and long. 16° 53′ e., and about 140 m. n.n.e. from Naples. Pop. '72, 50,524. It is strongly fortified, and defended by a massive old castle of Norman origin, nearly a mile in circumference. The city is divided into the old town and the new. The streets, with some few exceptions, are confined and gloomy. B., which is the see of an archbishop, has manufactories of cotton, silk, linen, soap, etc., and carries on an active export trade in oil, corn,

and fruit with Trieste and Dalmatia. Its harbor does not admit of the entrance of large vessels; but its quay and roadstead are good. It has some fine ecclesiastical structures, the most notable of which is the priory of St. Nicholas, a noble specimen of the Lombard style of architecture, founded in 1087, and liberally endowed by the brothers Guiscard. Within the walls of this building, Urban II., in 1098, held a council of Greek and Latin bishops, with the view of settling the differences between the two churches; and Roger II. was here crowned king of Sicily. The priory contains some interesting monuments and relics, the most remarkable of which is the tomb of Bona Sforza, queen of Poland, who died in the castle in 1557. B. is one of the cities believed to have been founded by Iapyx, son of Dædalus. Its coins show it to have been a place of considerable note among the Greeks as early as the 3d c. B.C. The Romans appear to have held it in but little repute; but it rose in esteem when, in the 10th c., it fell into the hands of the Greek emperors, who made it the capital of Apulia, and the residence of a viceroy. It was twice taken in the 11th c. by the Normans, who added to its strength and importance.—The province of B. contains 2280 sq.m., and a pop. of (1872) 604,540.

BA'RI, or BARIS, a savage negro tribe on the White Nile, living under chiefs. They are polygamists, and generally at war with traders, or among themselves. The poorer classes are employed in manual labor.

BA'RI, TERRA DI, a province in Italy, on the Adriatic, n. of Otranto; 2406 sq.m.; pop. '71, 604,540. The surface is mostly level, soil calcareous, covered with loam; the summers very hot, but other seasons pleasant. The Ofanto is the only river of any size. The province is well cultivated, producing grain, tobacco, flax, cotton, wine, oil, almonds, etc. Fine-wooled sheep are numerous, and salt and niter works are important. Besides the capital of the same name, the chief towns are Barletta, Trani, Bisceglie, Molfetta, Monopoli, and Tasano, on the coast, and Andria, Ruvo, Nola, Bitonto, and Conversano, inland.

BARIGAZ'ZO, a village of the province of Modena, remarkable for the streams of fire several feet high which issue out of the soil in the vicinity, and continue to burn for days without intermission.

BARIL'LA, an impure carbonate of soda, procured from plants which grow in salt-marshes or other places near the sea, and which forms a considerable article of commerce, being used in the manufacture of soap and of glass, and for other purposes in the arts. The greatest quantities of B. are produced in Spain and the Balearic islands; but the Canary islands, Italy, and France, also contribute a part. It is procured by burning the plants, much in the same way that sea-weeds are burned upon the coasts of Scotland to procure kelp. The Spanish B. is most esteemed, especially that produced near Alicante, which is chiefly obtained from the *salsola sativa*, a plant of the natural order *chenopodiaceæ*. This plant is there cultivated in grounds close by the sea, embanked on the side nearest it, and furnished with floodgates, through which the salt water is occasionally admitted. It is cut in Sept., dried in small heaps, and then burned in a hole in the ground. Other species of *salsola* (salt-wort), as *S. tragus* and *S. kali* (the latter a common native of the shores of Britain), are also burned for B., although they yield it in smaller quantity than *S. sativa*. B. is made in France from *salicornia herbacea* or *annua* (glass-wort), another of the *chenopodiaceæ*, plentiful also in salt-marshes on the shores of Britain and other parts of Europe. The manufacture of B. has greatly declined, from the fact that soda can now be made artificially from common salt. See SALT-WORT.

BARI'NAS, or VARINAS, a state in s. central Venezuela; 17,494 sq.m.; pop. 210,000; a fertile region producing coffee, indigo, tobacco, and tropical fruits in abundance, besides immense herds of cattle, sheep, asses, and mules. Barinas, the city of the same name, is on the Santo Domingo, 262 m. s.w. of Caraccas; pop. 3950. It was once prosperous, but was sacked by royalists during the war of independence. Tobacco of excellent quality is its chief export. The streets are regular, and the houses neat and clean.

BARING. The firm of Baring Brothers is one of the greatest commercial houses in the world. Its founder was John B., a German, who settled in a small business in Exeter, England, in the first half of the 18th century. Two of his sons, Francis and John, established in London in 1770 the now existing house.

FRANCIS became a director of the East India company, and being a stanch supporter of Pitt, was created a baronet by that minister in 1793. He took an active part in the discussions relative to the bank restriction act of 1797.

Sir THOMAS B., eldest son of the above, b. June 12, 1772, succeeded his father in the baronetcy. He appears to have taken no active part in the business of the firm, being chiefly remarkable as an admirer and encourager of art. His magnificent collection of paintings was dispersed by public sale after his death in April, 1848.

ALEXANDER B., brother of the above. See LORD ASHBURTON.

Sir FRANCIS THORNHILL B., son of sir Thomas, whom he succeeded, was b. in 1790, was educated at Oxford, where in 1817 he took a double first class. He entered parliament as M.P. for Portsmouth in 1826. Under successive whig governments, he was a lord of the treasury, secretary to the treasury, chancellor of the exchequer, and first lord

of the admiralty. He was more noted for his business aptitude than as a politician. He was created baron Northbrook in 1866, and died the same year. His son, the present lord Northbrook, was governor-general of India from 1872 to 1876.

THOMAS B., brother of the first lord Northbrook, b. in 1800, devoted himself early to commercial pursuits, and also to politics, taking the opposite side to his brother. He was, however, much more widely known as a partner in the firm of B. Brothers than as a politician. He died in Nov., 1873.

The firm is engaged to a large extent in the negotiation of national loans, in exchange and money-broking, in the produce trade, home and colonial, and in importation and exportation from and to foreign countries.

BARING, CHARLES, b. 1807; son of sir Thomas; a graduate of Oxford; bishop of Gloucester and Bristol in 1856; in 1861, the successor of Montague Villiers in the see of Durham.

BARING, THOMAS GEORGE, b. 1826; the second lord Northbrook. He has been a lord of the admiralty, under-secretary for war, member of parliament, and in 1872 was appointed viceroy and governor-general of India.

BARING-GOULD, SABINE, b. 1834; an English author educated at Cambridge; in 1863 he published *Iceland, its Scenes and Sagas*. He subsequently took orders, and was curate in several places. Among his works are *Post-Mediæval Preachers, The Book of Were-Wolves, Curious Myths of the Middle Ages, Origin and Development of Religious Belief, The Golden Gate, Legends of Patriarchs and Prophets*, etc.

BARI'TAH, *Bari'ta*, a genus of large Australian birds, placed by some ornithologists in the family of shrikes (q.v.), (*laniadæ*), and by others in that of crows (q.v.), (*corvidæ*). The bill is large, conical, scarcely curved, the base of it extending remarkably backward on the forehead. The best known species is the piping crow, or piping grakle, or Jarra-warnang of New South Wales (*C. tipicen*). It preys on small birds, is gregarious, has a melodious voice, is easily tamed, soon learns to whistle tunes, and exhibits a great power of mimicking the voices of other birds.

BARIUM (sym. Ba, eq. 68.5, in new system 137) is the metal present in heavy spar (sulphate of baryta) and baryta. It was regarded as a white metal, until the researches of Dr. Matthiesen demonstrated that it possesses a yellow color. As yet, the metal B. has not been obtained in mass, but only as a powder. It decomposes water readily at ordinary temperatures, and exposed to the air, quickly combines with oxygen, forming the *oxide of B.* (BaO), or BARYTA. The latter substance is an earth resembling ordinary caustic lime, and may otherwise be prepared by adding finely divided black oxide of copper (CuO) to a solution of sulphuret of B. (BaS), when the sulphuret of copper (CuS) is thrown down, and the baryta (BaO) is left in solution. On evaporation the water of solution passes off as steam, and leaves the solid earthy-looking substance, baryta. A third mode of preparing baryta is to heat strongly the nitrate of baryta ($BaONO_5$), when the nitric acid (NO_5) flies off, and leaves the baryta (BaO). The *sulphuret of B.* (BaS) is obtained when the sulphate of baryta ($BaOSO_3$) in powder is mixed with finely-pulverized coal, and the whole being placed in a crucible, is raised to a red heat in a furnace. The result is, that 4 atoms of the carbon (C) of the coal carry off the 4 atoms of oxygen in the sulphate of baryta as carbonic oxide (CO), whilst the B. united solely with sulphur is left behind as the sulphuret of B. (BaS). The *chloride of B.* is prepared by adding hydrochloric acid (HCl) to a solution of the sulphuret of B. (BaS), when hydrosulphuric acid (HS) escapes, and chloride of B. remains behind, and on evaporation of the liquid, is obtained in crystals.

BARK. See BARQUE.

BARK (*cortex*), in phanerogamous or flowering plants, is the external covering of the stem. It is composed of layers of cellular tissue, whilst the woody stem, to which it forms a sort of sheath, is vascular. In endogenous plants (palms, etc.), there is not, in general, a very marked line of separation between the B. and the vessels or vascular bundles of the stem, so that these plants are generally, but incorrectly, said to have no bark. It is in exogenous plants, and especially in perennial woody stems, that the development of B. is most perfect, and the distinction between wood and B. most marked. The outermost layer of the B. of exogenous plants is the *epidermis* (q.v.), which, however, is in general only to be seen in annual stems, and in the youngest parts of woody stems; peeling off as the stem becomes older along with the outer layers of the true bark. Beneath the epidermis is the true B., of which the outer layer is called the *epiphlœum* (Gr. outer bark), and consists of cells, usually rectangular and flattened, with thick walls. The inner layer of the true B. is called the *mesophlœum* (Gr. middle bark), and is generally formed of a cellular tissue of roundish cells with thin walls. These layers are sometimes very distinctly separated from one another, and sometimes pass gradually into one another; sometimes there is merely a continuous cellular tissue. Within the true B. is a very distinct layer, the inner B., *liber* (Lat.) or *endophlœum* (Gr. inner bark), also frequently called bast, which is composed of bundles of woody fiber or vascular tissue mixed with cellular tissue. The layer of cambium (q.v.) is often regarded as belonging to the inner B., but rather belongs to the vascular part of the stem. In the inner B. are sometimes found cells containing a milky juice, as in the *apocynaceæ*, or

vessels for a milky juice, as in the common fig. The combined strength and flexibility of the fibers of the inner B. render it in many cases useful for various purposes. See FIBER and BAST. In the true B., the peculiar juices and most characteristic substances elaborated by the plant are very generally found, for which reason that part is often of the greatest importance in medicine and the arts. The B. of many trees abounds in *tannin* or *tannic acid* (q.v.).

The B. of a stem or branch of not more than one year old exhibits only a cellular integument or epidermis with an interior lining of woody fiber—the inner B.; but new layers are added from year to year, the B. as well as the woody stem being increased from the cambium, the mucilaginous layer which is interposed between them, and which particularly abounds in spring, when the separation of the B. from the stem is most easy. The annual layers, however, cannot long be distinctly recognized in the B. as in the wood; and in the older portions of woody stems, the outermost parts of the B. become desiccated and lifeless, and are in general gradually thrown off. On this account, those mosses, lichens, and other plants which attach themselves only to the outermost layer of the B. of trees, and derive their nourishment from it, cannot be regarded as true parasites, as they are in no degree supported by the juices of the stem, but only consume and remove external matter already destitute of life. The B. of some trees is remarkable for the thickness which it acquires, as that of the cork-tree, in which the *epiphloeum* is formed of many layers of cells. The outer parts of thick barks very often crack, to admit of the expansion of the stem within; in the lace-bark tree of the West Indies, the fibers of the inner B. become partially separated as it is distended, forming lozenge-shaped meshes arranged with beautiful regularity.

The connection between the cellular tissue of the B. and that of the pith in the center of the tree is continually maintained by means, in exogenous stems, of the medullary rays. See EXOGENOUS PLANTS and PITH. The B. is a protection to the young and tender wood; it appears also to exercise functions analogous to those of the leaves, which, when young, it resembles in its color, and which are regarded as dilatations of it, so that it has been called the "universal leaf" of a plant.

BARK, in medicine, etc. The principal barks used in medicine will be found noticed in separate articles. See ANDIRA (*Cabbage B., Surinam B.*); ANGOSTURA B.; CARIBBEE B. (*Jamaica B., St. Lucia B., Piton B.*); CASCARILLA (*Cascarilla B., Eleutheria B.*); CINCHONA (*Cinchona B., Peruvian B., Jesuits' B.*, China, Cascarilla, *Arica B., Calasaya B., Carabaya B., Huamalies B., Huanuco B., Jaen B., Loxa B., Maracaibo B., Ash B., Crown B., Silver B., Yellow B., Tan B.*, etc.); CLOVE B.; COPALCHE B.; CULILAWAN B.; WINTER'S BARK.—When B. is mentioned without any prefix, it is always cinchona, otherwise called Peruvian or Jesuits' B., which is intended.

The barks used for dyeing, tanning, and other purposes in the arts, being generally named from the trees which produce them, particular references here are unnecessary.

BARK, FOR TANNING. The B. of many trees is capable of being used for tanning (q.v.), but those kinds of B. are preferred which particularly abound in tannic acid. Oak B. is principally used in Britain and throughout Europe; also in North America, although that of America is obtained from species of oak different from the European; in Spain, the inner layer of the B. of the cork oak, or cork-tree, is employed, and it is to some extent imported into Britain for the use of tanners. The B. of the chestnut is also much esteemed. Larch B. and willow B. are used in preparing some kinds of leather. The B. of the birch and that of the alder are also employed; birch B. being, however, more esteemed for steeping fishermen's nets and cordage, to preserve them from rotting, than for the preparation of leather. Different species of *acacia* (q.v.) and of *eucalyptus* (q.v.) furnish barks used for tanning in Australia, some of which have, to a small extent, become articles of commerce.

The *barking* of trees can be accomplished with facility only in spring, when the sap has begun to circulate. The tree being felled, the rough external lifeless parts of the B. are removed as useless, by means of a sharp instrument called a *scraper;* the smaller branches are cut into lengths of about 2 ft., and their B. is loosened by beating with a mallet, and easily taken off—as boys at the same season make plane-tree whistles; the B. of the trunk and main branches is cut through by a chisel-like instrument, called a *barking-iron*, into similar lengths, each of which is divided longitudinally, and finally stripped off by the aid of mallets, chisels, etc. The B. is sometimes dried in sheds, being placed on narrow shelves or frames in such a way that there may be a very free circulation of air about it; sometimes in the open air, when it is very generally made to rest in a sloping position against trunks of trees placed horizontally at a little distance from the ground, the larger pieces of B. being placed so as to protect the smaller both from sun and rain. Great care is necessary in the drying of B., as it is much spoiled if allowed to get moldy, and is liable to suffer injury from rain or from the exposure of its inner surface to the sun.—Oak and birch B. are usually about equal in their price, which, however, varies very much, from £4 to £8 per ton. Larch B. is much less valuable; it is also of much greater bulk in proportion to its weight. The B. is a very important source of the revenue derived from many woods and coppices.

BARK BEETLE, or BARK-CHAFER, a name common to many of the large family of coleopterous insects (q.v.), called by entomologists *xylophagi* (Gr. wood-eaters). They

are all small, and generally of uniform color; they have hard bodies, and short, often club-shaped antennæ. Most of the family live in wood or other vegetable substances, as mushrooms, dried plants in herbariums, etc., and some of them are extremely injurious to living trees. Those called B. beetles or bark-chafers bore holes in the bark, and deposit their eggs in the inner bark, in which the larvæ excavate pathways, often causing the death of the tree. One species in particular, sometimes called the common bark-chafer (*tomicus typographus*), and sometimes the typographer beetle, from the figure of its burrows, has from time to time appeared in extraordinary numbers, ravaging the forests of Germany. In 1783, it caused the death of a million and a half of pines in the Harz forest alone. This insect is mentioned in some of the old German liturgies under the popular name of "the Turk," which its dreaded ravages obtained for it.

BAR'KAL, or JE'BEL BAR'KAL, a singular sandstone rock in Nubia, situated in lat. 18° 31′ n., and long. 31° 46′ e., about a mile from the right bank of the Nile. It is quite isolated, perpendicular on the side facing the river, and very steep on all. It is about 2 m. in circumference at the base, and 400 ft. in height, its summit forming a pretty broad plateau. Between it and the river are the remains of some magnificent temples, the two principal ones being known as the typhonium, and the great temple, one of the largest monumental ruins of Nubia. The ancient city of Napata is supposed to have been situated in the vicinity. The two red granite lions, now in the Egyptian room of the British museum, were brought from here in 1832 by lord Prudhoe.

BARKER, EDMUND HENRY, a well-known English philologist, was b. 22d Dec., 1788, at Hollym, in Yorkshire, and studied at Cambridge. Besides editions of several Latin classics, and numerous contributions to periodicals, particularly to the *Classical Journal*, he was led, during a residence with the famous philologist Parr, to undertake a revision of Stephens's *Thesaurus Linguæ Græcæ*. This gigantic work was violently assailed in the *Quarterly Review* by Blomfield, against whom B. wrote his *Aristarchus Anti-Blomfieldianus* (London, 1818); yet he and his publisher, Valpy of London, carried it on and completed it in a spirited manner (13 vols., 1816–28). In 1812 appeared the first volume of his *Classical Recreations*. He also supplied materials for the composition of Sturtz's *Etymologicum Gudianum*. He likewise translated some works of German philologists, among others, Buttmann's *Greek Grammar for Schools*. He collected the mass of anecdote and criticism relative to his friend Dr. Parr, which was published in 2 vols. in 1828–29, under the title of *Parriana*, a work well-nigh unreadable, from the superabundance and ill-digested nature of its matter. He also assisted prof. Dunbar in the compilation of the Greek and English Lexicon published in 1831. He lost all that he had in a lawsuit about a valuable inheritance, so that he was obliged to sell his fine library, and was put into the debtors' prison. He died in London, Mar. 21, 1839, in extreme poverty.

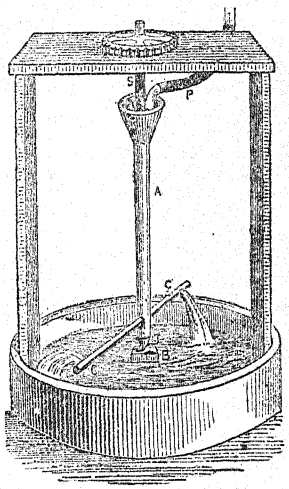
BARKER, FORDYCE, b. Maine, 1819; graduated at Bowdoin, and studied medicine at Harvard, Paris, and Edinburgh; professor of midwifery at Bowdoin, and in New York medical college; president of the New York state medical society, and professor of clinical midwifery and diseases of women in Bellevue medical college. He wrote, in 1872, a treatise on puerperal diseases.

BARKER, GEORGE F., b. Mass., 1835; graduate of Yale scientific school; chemical assistant in Harvard medical school; professor of chemistry and geology in Wheaton (Ill.) college; acting professor of chemistry in Albany medical college; professor of physiological chemistry and toxicology in Yale; professor of chemistry in the university of Pennsylvania, and vice-president of the American association for the advancement of science. He has lectured in many cities, and is author of a *Text-Book of Elementary Chemistry*.

BARKER, JACOB, 1779–1871; b. Maine; an eminent merchant and financier. He began trade in New York; lost his fortune in 1801; recovered soon after, and in the war of 1812 raised a loan of $5,000,000 for the government. He was a state senator in New York when the senate was the court of appeals. He established a newspaper to advocate the election of De Witt Clinton for governor; founded the exchange bank in New York, and became a heavy operator in stocks; failed, was indicted with others for conspiracy to defraud; defended himself in person, and the jury disagreed; was tried twice more, and then the indictment was quashed. He removed to New Orleans in 1834 and built up a fortune, but was impoverished by the rebellion, in which he was loyal to the union.

BARKER, JOHN, descended of an English mercantile family, became, in 1799, agent for the East India company at Aleppo; in 1826, British consul at Alexandria; and afterwards consul-general in Egypt. In the year 1834, he removed from this situation to the lonely but lovely valley of Suedia on the Orontes, four leagues from Antioch, where he employed himself in the cultivation of the choicest fruits of Asia and Europe. We are indebted to him for the Hanwick nectarine, the most delicious yet introduced into our gardens. The good terms on which he stood with the people around him and with the government, enabled him to render many valuable services to European travelers. He died at Suedia on the 5th of Oct., 1850.

BARKER'S MILL (Fr. *roue à réaction*, Ger. *Segner's wasserrad*), a water-wheel invented by Dr. Barker towards the end of the 17th century. It is represented in its simplest or typical form in cut. A is a wide metal pipe, resting at its lower end by the steel spindle T, on a metal block B, and kept in a vertical position by the spindle S, at its upper end, which passes through the frame of the machine, so that it can easily revolve round its axis. Near its lower end, two smaller pipes or arms, C, C, are inserted, which project horizontally from it, and these have each, at the outer extremity, a hole cut vertically in them, opening towards opposite sides. The water is supplied by the pipe P, which opens over a funnel-like widening on the upper part of A, and the quantity is so regulated that while the pipe A is kept nearly full, no more is admitted than issues from the lower orifices. The reaction caused by the water gushing from the arms, forces them backwards, and gives to the whole machine a rotatory motion. This reaction is much the same as is seen in the recoil of a gun when fired, or in the pushing back of a small boat by the foot on stepping ashore. It may be also thus explained: Suppose that the arms were closed all round, the water would press against the sides with a force proportional to the height of the water in the pipe A, and the pressure against any particular surface of the side would produce no motion of the arm, because an equal pressure is exerted in a contrary direction by a corresponding surface opposite to it. Now, if one of these surfaces be cut out, the pressure against the other being uncounteracted, forces the arm in the opposite direction to that of the side in which the whole is made. This being done to both arms on opposite sides, two equal pressures are produced, which conspire in generating the same motion of rotation. As soon as motion ensues, centrifugal force comes into play, which, throwing the water out towards the ends of the arms, increases the rapidity of its discharge, and also its reacting power. When the wheel is in action, the water thus acts under the influence of two forces—one being the pressure of the column in A, and the other the centrifugal force generated by the rotation of the wheel itself. The motion of the wheel is transmitted by the spur-wheel fixed to the spindle S, to the machinery which is to be driven by it, or, in the case of a corn-mill, the spindle passes directly through the lower millstone, and is firmly fixed into the upper one.



The power is manifestly increased by heightening the water-column, or by lengthening the arms—the former increasing the pressure of the water, and the latter increasing the leverage at which this pressure acts. In the mill shown in the figure, the column in A cannot be advantageously heightened, for the higher it rises, the greater must be the weight which the conical spindle, T, has to sustain, and the greater, consequently, becomes the friction. It is from this circumstance that such mills are found, in practice, to yield but a small mechanical effect—the friction consuming too large a proportion of the work of the wheel. Hence, in the reaction wheels now in use, the original B. M. has been so modified as to allow of the water being conducted from the reservoir below the arms instead of above. This is effected by making the vertical pipe revolve below in a stuffing-box at its junction with the conduit, and above, by a pivot moving in the fixed frame. By this arrangement, the friction attending the rotation is reduced to a minimum, for not only is the weight of the water placed out of account, but also a large proportion of the weight of the wheel itself, which is borne by the upward pressure of the water. The mechanical performance of such wheels is said to be highly satisfactory, producing, with a limited supply of water falling from a considerable height, a useful effect, hardly to be obtained by any other contrivance. The power of these machines may be also increased by using curved instead of straight arms. With straight arms a considerable loss of force is incurred by the sudden change of the direction of the current when it leaves the arm, which does not take place to the same extent with curved arms, where this change is effected gradually. In Whitelaw's mill (hence called the Scottish turbine), the form of B. M. generally met with in Scotland, there are three instead of two curved arms of this description. Considerable difference of opinion still exists as to the merits of B. M., some considering it as the most perfect way of applying water-power, and others putting it in the same rank as an undershot wheel, with the same water-supply. Of late years, it has been more extensively employed than formerly, both in this country and on the continent. See WATER-POWER.

BARKING, a t. of the co. of Essex, England, in a low flat situation, on the left bank of the Roding, about 2 m. above its junction with the Thames, and 5 m. n.e. of London, on the North Woolwich railway. Pop. '71, 5766, among whom are many fishermen, who pursue their occupation on the Thames, the tide flowing up the Roding to the town. The mouth of the Roding is often called Barking creek. The neighborhood

sends large quantities of potatoes and vegetables to the London market. There is also a transit trade in coal and timber. The church of St. Margaret is an edifice of considerable beauty, in the perpendicular style, and probably of the beginning of the 15th c.; but it contains three columns of the early Norman style, supposed to have been brought from the ruins of the adjacent abbey.—*Barking Abbey* was one of the richest nunneries in England. It was founded about 677 A.D., in the reigns of Sebba and Sighere, kings of the East Saxons, by St. Erkenwald, bishop of London, whose sister, St. Ethelburga, was the first abbess. In 870, it was burned to the ground by the Danes, and the nuns killed or dispersed. It was rebuilt and restored to its former splendor by king Edgar, in the middle of the 10th century. The abbess of Barking was one of four ladies who held the rank of baroness in right of their office. She lived in great state, and always furnished a quota of men to the king in time of war. She was required also to maintain certain embankments on the Thames. Several queens of England, and other ladies of very high birth, assumed the office of abbess of Barking. After the suppression of convents by Henry VIII., the abbey buildings soon went to ruin, and scarcely any remains exist except the gate-house.

BARK-STOVE, in gardening, a kind of hot-house intended for those plants which require not only the greatest heat, but also a continually moist atmosphere. It derives its name from the use of tanners' bark, for the purpose of producing this atmospheric condition. The bark is placed in a pit, lined and paved with brick, and pots containing tropical plants are sunk in it; by which means the plants not only enjoy a moisture resembling that of their native climates, but the earth around their roots is kept uniformly and moderately heated. The principle of the B. is adopted in pineries, palm-houses, etc., also in forcing-stoves for producing the ordinary fruits and vegetables of temperate climates at unusual seasons. A considerable heat results from the fermentation of tanners' bark, but it is not upon this that its value in the B. chiefly depends.

BAR'LAAM AND JOS'APHAT, one of the most widely-spread religious romances of the middle ages, relating the conversion of the Indian prince Josaphat by the hermit Barlaam, and thereby illustrating the power of Christianity to overcome temptation, and proving its superiority over all other creeds. The story, however, has been discovered to be nothing more or less than a Christianized version of the legendary history of Buddha, agreeing with it in all essentials and many details. The celebrated divine, John Damascene, is regarded as the author of the original Greek MS., which was first published by M. de Boissonade in the 4th volume of his *Anecdota* (Paris, 1832), and translated into German by Liebrecht (Münst., 1847). But even in the middle ages, a Latin version of this romance had been extensively circulated. About the end of the 15th c., it was often printed in a detached form, and later it appeared amongst the works of John Damascene (Paris, 1609). Vincent de Beauvais wove the story into his *Speculum Historiale*. From the Latin version sprung three French poetical versions belonging to the 13th c., and as yet unprinted. The Italian *Storia di S. Barlaam* (latest edition, Rome, 1816) may be traced to a Provençal original as early as the beginning of the 14th century. In Germany, Rudolf von Ems derived his poem, *B. and J.*, first printed at Königsberg (1818), and later at Leipsic, from the Latin of John Damascene. There is also an Augsburg impression of a prose translation of the ancient Latin text, belonging to the close of the 15th century. The Spanish *Historia de B. y J.*, by Juan de Arze Solorzano (Madrid, 1608), the Polish poetical version, by Kulizowsky (Cracow, 1688), as well as the Bohemian (Prague, 1593), are all borrowed from the Latin; while the Icelandic *Barlaams Saga*, and the Swedish popular tale, *B. och J.*, have a German source. A Norwegian version, printed from an old vellum MS. of the beginning of the 13th c., said to have been translanted by king Hakon Sverreson, appeared in 1851. This romance has even been rendered into the Tagala language of the Philippines, and there printed (Manilla, 1712).

BAR-LE-DUC, or BAR-SUR-ORNAIN, a t. in the department of the Meuse, France. It is situated on the Ornain, about 125 m. e. from Paris, with which it is connected by railway, and with the Rhine by canal. Pop. '76, 16,643, who manufacture cotton and calicoes, and carry on a considerable trade in timber from the Vosges, for the use of Paris, and in iron, wool, and wine. B. has a communal college, normal school, and public library. Its origin dates from the 10th century.

BARLET'TA, a fortified seaport of Italy, province of Bari, on the Adriatic. Pop. '72, 28,163, who carry on a large shipping-trade with Greece, the Ionian islands, and other ports of the Adriatic. The town is well built, handsome, and clean; has a fine cathedral, a colossal statue supposed to represent the emperor Heraclius, a college, theater, and castle, formerly one of the most impregnable fortresses in Italy. A feature of B. is the large and magnificent gateway which leads to its harbor. During the blockade of B. by the French in 1502–3, which ended in the defeat and death of their commander, the duke of Nemours, the celebrated combat between eleven cavaliers of France, and as many of Spain, in which the chevalier Bayard so distinguished himself, took place, and ended in a drawn battle.

BARLETTA, GABRIELLO, an Italian Benedictine preacher of the 18th c., famous for eccentricity as well as eloquence, interlarding the reading of litanies with sharp practical comments. His collected sermons passed through many editions.

BARLEY, *Hordeum*, a genus of grasses, to which belong one of the most extensively cultivated kinds of grain. The genus is distinguished by spiked inflorescence, three spikelets being always situated upon each tooth of the rachis, of which sometimes only the middle one is fertile, and sometimes all the three, so that in the former case the fruit-bearing spike is two-rowed, and in the latter case, six-rowed; the glumes are two, containing a single floret; the paleæ two, the outer one awned; and the seed is surrounded by the paleæ. The species of this genus are almost all annual, although some varieties of B. are sown in the end of autumn, and the cultivation of them extends over the winter. B. is mentioned in the books of Moses and other books of the Old Testament, also by the Greek and Roman writers, and has been extensively cultivated from remote antiquity. Beer made from it was known to the Greeks, the Egyptians, and the ancient Germans. The cultivation of it appears to have extended from Italy northwards in Europe, but it is better adapted than any other grain to the most northern regions, some of its varieties being cultivated with advantage where the climate is too cold, or the summer too short, for any other cereal crop; and it is deemed probable that its native country is northern or central Asia. It is capable, however, of being cultivated in very warm climates, and extends over a wider climatic range than any of the other grains. B.-meal is used for bread in the northern parts of Europe, but in other parts of the world, B. is more generally converted into malt for the making of beer (see BREWING), or merely deprived of its outer skin, and so used as an article of food. B. intended for brewing is first subjected to the process of *malting*, by which it is converted into MALT (q.v.). B. simply deprived of the husk (*palea*) in a mill is called *pot B.* or *Scotch B.* When the pellicle of the seed is also removed, and the seed itself rounded and polished, it is *pearl B.* What is sometimes called *patent B.*, is a farina obtained by grinding pearl B., and differs from B.-meal in being quite free from a degree of acridity which the latter derives from the integuments of the seed.

It is doubtful if this grain is produced by more than one species, or whether what have been described as distinct species by botanists, are not really mere varieties, the result of long cultivation. *H. vulgare* is usually distinguished as having the grains disposed in four rows; *H. hexastichon*, as having them in six rows; and *H. distichon*, as having the lateral spikelets abortive, and the grains, therefore, in two rows. But the lower part of the spike in the varieties ranked under *B. vulgare* is often six-rowed, and only the upper part four-rowed, and in rich soils, a tendency to resume the six-rowed form is otherwise manifest. Nor are the kinds known as *naked B.*, in which the seed separates readily from the paleæ, to be looked upon as more distinct. The four-rowed or six-rowed varieties are generally coarser, but more productive than the two-rowed; and some of them, often called BEAR or BIGG, are regarded as most suitable for exposed situations and inferior soils. A kind with naked seeds, called *Siberian B.* (*H. cœleste* of some writers), is extensively cultivated in some parts of Europe, and its straw is regarded as affording a richer food for cattle than that of most other kinds. The *Nepaul* or *Himalaya* B., another variety with naked seeds, and further characterized by the irregular manner in which the grains are placed in the spike, paleæ three-lobed at the end, and very short awns—and which is therefore regarded by some botanists as a distinct species (*H. trifurcatum* or *H. Aegiceres*) has been recommended as particularly adapted for cold mountainous regions, yielding good crops in the Himalaya at an elevation of 14,000 ft. above the level of the sea. Of the two-rowed B. there are many varieties, of which the common or early English B., the Italian B., and the *Chevalier B.* are among the most esteemed, the latter being in particular demand for the brewing of the finest ales. It takes its name from M. Chevalier, who introduced it. The *Sprat* or *Battledore B.* (*H. zeocriton* of many botanists) is also two-rowed, but is distinguished by the grains standing out from the spike, their awns spreading very widely. It is sometimes called *German rice*, as it swells by boiling in the way that rice does, and for some purposes forms a good substitute for it. It is scarcely cultivated in Britain, but is in much esteem in Germany, and succeeds well in the Alps at an elevation of 3360 ft.

Three species of *hordeum* are natives of Britain, of which one (*H. murinum*), a small grass, is pretty common on waste-grounds, especially in England, and is apt to prove troublesome by its long awns causing inflammation in the mouths of cattle. Still more injurious in this way is the North American *H. jubatum*, or squirrel's tail. Another MEADOW B. or MEADOW B.-GRASS (*H. pratense*), frequent in meadows in England, is reckoned a good pasture grass. *H. bulbosum*, a native of the s. of Europe, and n. of Africa, is cultivated in Britain for herbage, of which it yields a large quantity, much relished by cattle, and particularly by horses. Several species are natives of North America.

BARLEY, CULTIVATION OF. Barley was cultivated largely by the Romans, as well as many other nations of antiquity. Though sometimes used as food by the soldiers, it was most generally used as food for horses. The ancient inhabitants of Gaul prepared a spirituous liquor, a kind of beer, from it. Many of the other western nations latterly applied it to the same use, and it also became an important article of food. Being a plant which is most productive where the climate is moderately dry and warm, the excessive heats of some parts of Europe are adverse both to the quantity and quality of its grain. It is, however, cultivated to a large extent in some parts of the continent where the soil

is specially suited to it, such as in Belgium, Holland, Prussia, and Denmark. Indeed, while most of the countries of Europe send us wheat, it is chiefly Denmark and Silesia that supply us with barley. For this reason, the prices of B. have been relatively higher in this country than those of wheat, since the introduction of free-trade in grain. No country seems to possess a soil and climate so well suited to its growth as many parts of Britain. In former times, this grain was largely used in the British islands as human food; but this is not the case now, except in some parts of Ireland and, in a stray instance, in the highlands of Scotland, where the condition of the population has undergone comparatively little amelioration. In Scotland, however, a considerable quantity is made use of in the making of broth. In this case, the grain is denuded of its husk by the friction of revolving millstones, and goes under the name of pot barley. But the larger proportion of the B. grown in Great Britain, as well as that which is imported, is employed in the distillation of spirits, and in the manufacture of beer, ale, and porter. The moderate qualities are taken up by the distillers, while the brewers of ale and porter require the finest, which are known by the silvery color of the husk, and the specific gravity of the grain. Fine malting B., therefore, always commands a ready demand in the London market, as well as a high price. For several years barley has not only grown better than any other grain with the British farmer, but has commanded relatively the best prices.

Perhaps the cultivation of B. occupies as prominent a share of the arable lands of Suffolk and Norfolk as of any other part of Britain. Fine malting qualities are grown on the turnip-soils of these counties, as well as throughout the s.e. counties, where the four-course rotation is adopted. In this rotation, the B. follows the turnip-crop, which is usually consumed on the land by sheep. The ground is carefully prepared by plowings and rollings, to pulverize it thoroughly before the reception of the seed, which is usually sown by a drill machine at the rate of about two bushels to the acre. On the strong lands of Suffolk and Huntingdon, the B.-crop is sown after a summer-fallow or a green crop, in which case the soil is plowed before the frosts of winter sets in, to render it friable by spring. As soon as the weather permits, after the first week of February, the seed is committed to the ground. A fine mold is in this way obtained, and the crops are usually abundant and of good quality. In the s. of England, the grain is allowed to stand till it is fully ripe, when it is either cut with the scythe or most commonly now with the reaping-machine. In some parts, it is not bound up into sheaves, but remains in the swath for a few days, when it is afterwards carted, and stored into barns. A small portion of the B.-crop is still thrashed out by the flail, owing to the maltsters being under the impression that the thrashing-mills injure the germinating powers. The chief varieties grown in England are the Chevalier, the common, the early English, and the Norfolk. The first named is the most largely sown, as the quality is superior to any other, and, under liberal treatment, the yield is greater. The produce is more influenced by the seasons than that of wheat, as it is liable to suffer from droughts in the early part of the year. On well-farmed land, from 48 to 60 bushels and upwards are got to the acre. In the peaty soils of the fens of Lincolnshire, B. is not raised, as it is too liable to lodge with the rain; neither is B. a favorite crop in the moist climate of the w. of England. It does not endure the rains so well as wheat, nor do so well on highly farmed land. In Wales and Lancashire, it is generally grown after a crop of wheat, and the cultivation and management are not so careful as in the east.

Barley has long been grown in Scotland, and comes to great perfection where the soil and climate are suitable. The level parts of the Lothians and other counties in the s. of Scotland, with Moray, Inverness, and Ross in the n., are the districts in which the finest crops are raised. In these rich districts, B. is commonly sown after a portion of the turnip-break. For this reason, it does not occupy so large a proportional breadth as it does under the Norfolk four-course. The produce is equally abundant, however, and the quality of the grain is often not inferior. Chevalier is the favorite variety there also. The crop, when ripe, is cut by sickle, scythe, or reaping-machine; bound up at once, and put into stooks, to defend it from the weather, till ready to cart, and to be built up in neat round stacks. The grain is invariably thrashed out by machinery. In the higher districts of Scotland, where the soil and climate are not so good, the inferiority of the grain, unless in an especially favorable year, both in quality and quantity is considerable. It is only in fine seasons that the quality is such as to render it an object to maltsters, and in wet, cold unsuitable seasons, distillers can only make use of it at a reduced price. The Chevalier variety is a little late for inferior climates, and the early English and other kinds that come sooner to maturity are often preferred. In Berwickshire, Aberdeenshire, Banffshire, Kincardineshire, and Forfarshire, the five-course rotation—of two years' grass, oats, turnips, and B.—is more generally adopted than in some other counties in Scotland, and a large quantity of this grain is raised, but the quality is generally inferior to that of the crops in e. Lothian. Along the light soils fringing the Moray and Cromarty firths, as fine quality of grain is got as in e. Lothian. Morayshire B. has long been famous for its fine sample, and is in great demand with English brewers. On the other hand, in the less genial climate of the western counties, and also of the upper parts of Aberdeenshire, Banffshire, and Perthshire, less B. is sown, and oats frequently succeed the green crops. In these parts the variety known as bear, or bigg, was for many a day preferred to any other, as it is not so liable to lodge, and it with-

stands wet weather far better, and comes earlier to maturity. Bear, too, is the variety which is cultivated by many of the small cotters in the highlands and islands. Instead of a rotation in which green crops find a place to husband and spare the natural resources of the soil, a succession of corn crops are taken, with an occasional rest to the soil, and then a resumption of the cropping.

As to the manuring of the crop, on the turnip soils of the s. of England, the land is enriched by the droppings of the sheep. In the strong soils of Norfolk and Huntingdon, guano, rape-cake, and other manures abounding in nitrogen, are applied when the seed is sown. In the w. of England, the moist climate renders the application of manures more precarious, and B. is frequently taken after a crop of wheat without any application of fertilizers. When the turnip crop is drawn from the land, as it often is in Scotland, guano is the manure held in most estimation; the quantity applied is from 2 to 4 cwt. per acre. In Berwickshire and Morayshire, as in Norfolk, the prevalence of the five-course shift, and the practice of eating the crop on the ground, secure a sufficiently liberal manuring. In other parts, where B. is taken after wheat, farm-yard manure is often applied, as well as guano and phosphoric manures. In some northern counties, the root crops are laid down with artificial manures, and the roots carted off, farm-yard manure spread on the land and plowed in with the "seed furrow." B. requires a fine tilth and soil in rich manurial condition. The earlier it is sown in the season, the more liberal ought to be the applicatiion of nitrogenous manures. The later it is sown, manures containing nitrogen should be used more sparingly, and a portion of phosphoric manures substituted in their stead.

BARLEY-BREAK, a popular amusement, very common in the reign of James I., and with certain modifications, in name and practice still existing among young persons, both in England and Scotland. Originally, it was played by six people, three of each sex, who were formed into couples. A piece of ground was then apportioned into three parts; and into the center one, called *hell*, a couple was doomed by lot. The sport consisted in the two in the condemned part "catching" one of the other couples while they were in the act of changing places, when the couple caught had to go into the center. It was, however, no easy matter for the two in the center to capture another couple, for by the rules of the game, they were bound to keep united, while the others, when hard pressed, might sever. Thus, sir Philip Sidney, in describing the game, says:

> Soon as the middle two
> Do, *coupled*, towards either couple make,
> They false and fearful do their hands *undo*.

When the whole had been caught, the game was ended, and the last couple taken was said to be in hell. Their punishment appears to have consisted in kissing each other. Herrick says, in referring to the game:

> If kissing be of plagues the worst,
> We'll wish in hell we had been last and first.

In Scotland, the game consisted in one person chasing the rest round the stacks in a farmyard; and when one was caught, he or she had to assist in capturing the rest. The origin of the name is doubtful. Dr. Jamieson suggests that, in Scotland, the locality of the game may have given it its name—"barla-bracks, about the stacks." The same authority also adds: "Perhaps from *barley* and *break*, q., breaking of the *parley*, because after a certain time allowed for settling preliminaries, on a cry being given, it is the business of one to catch as many prisoners as he can." This supposition is not improbable. In the modern games of "shepherds a-warning" and "tig," which appear to have been derived from B., a "barley" means a *parley*.

BARLEYCORN, JOHN, a personification of the spirit of barley or malt-liquor, used jocularly, and also in humorous poetical effusions. There exists a whimsical English tract of old date, under the title of *The Arraigning and Indicting of Sir John Barleycorn, Knt., printed for Timothy Tosspot*, in which sir John is described as of "noble blood, well beloved in England, a great support of the crown, and a maintainer of both rich and poor." See Hone's *Everyday Book*, vol. i.

BARLEY-SUGAR, a confection prepared with sugar and a decoction of barley. See SUGAR.

BARLOW, FRANCIS CHANNING, b. N. Y., 1834; a graduate of Harvard; served in the union armies of the rebellion, and rose to be maj.gen. He has been secretary of state and attorney-general of New York.

BARLOW, JOEL, an American poet and politician, b. in 1755 at Reading in Connecticut. He studied at Yale college in New Haven. He was intended for the profession of the law, but served as a military chaplain during the war of independence. In 1787, he published a poem called *The Vision of Columbus*, which in 1805 appeared anew in an enlarged form as *The Columbiad*. It abounds in beautiful passages, but is overburdened with political and philosophical disquisitions, and disfigured by singularities of expression. B. accepted a commission in 1788 to prosecute the sale of lands for the Ohio company in England and France, where he signalized himself by zealous republicanism; published in 1792 in London a poem entitled *The Conspiracy of Kings*, and endeavored also to work upon the public mind in England by political pamphlets. In autumn 1792

he was deputed by the London reformers, with whom he was associated, to proceed to Paris, where he received the rights of French citizenship. He spent some years on the continent of Europe in political, literary, and mercantile pursuits, and was for a short time American consul at Algiers. He returned to America in 1805, and was appointed ambassador to France in 1811. He died in Oct., 1812, at Zarnawiczc, near Cracow, when on his way to a conference with the emperor Napoleon at Wilna.

BARM. See YEAST.

BAR'MECIDES, or BAR'MEKIDES, a Persian family, distinguished amongst the most powerful in the province of Khorassan, the cradle of the greatness of the Abbaside caliphs, whose cause the *children of Barmek* espoused. *Khaled-ben-Barmek*, the first of these whose authentic history has reached us, was the prime-minister of Abul Abbas Al-Saffah, the first Abbaside caliph; and his influence enduring through the reigns of Al-Mansur and Mohdi, the latter intrusted him with the education of his son, the celebrated Harun Al-Raschid. Yahya, the son of Khaled—according to eastern historians, equally conspicuous for virtue and talent—was made vizier by Harun upon his accession to the caliphate (786 A.D.), and both by his military skill and civil administration, contributed largely to the prosperity of the reign—the caliph himself bestowing on him the appellation of father. Harun, however, afterwards becoming jealous of the growing power and popularity of two of Yahya's sons, Fadhl and Jarfar (the Giafar of the *Arabian Nights*), had them executed, and the whole of the B. throughout the kingdom arrested, and their goods confiscated. Harun even carried his enmity so far as to forbid the mention of their name on pain of death, but their virtues and their glory are celebrated by almost all Mohammedan poets and historians.

BAR'MECIDE'S FEAST, a phrase originating most probably in the story of the barber's sixth brother, recorded in the *Arabian Nights*, and abridged in the *Guardian*, No. 162. The substance of the story is as follows: One Schacabac being in great want, and not having tasted food for two days, ventured to visit a rich Barmecide (see BARMECIDES) noted both for his hospitality and eccentric humor, in the hope of generous entertainment. The Barmecide, on learning his condition, invited him to dinner. Schacabac was presented with an empty plate, requested to "make himself at home," and by and by, asked "how he liked his rice-soup." It was apparently a cruel jest to play off on a starving man. Schacabac, nevertheless, feigned to enter into the humor of his host, and expressed his conviction that the rice-soup was delicious. The Barmecide continuing the imposition, next asked his victim if he ever saw whiter bread. Poor Schacabac, who saw neither bread nor meat, nor indeed anything eatable, made a prodigious effort to look happy; he even went the length of gently remonstrating with his host for not supposing him completely satisfied. In this way a magnificent but fictitious dinner was disposed of. When wine, however, was produced, Schacabac pretended only to taste it on the ground that he was "quarrelsome in his liquor," and might do his host an injury. The Barmecide forced him, however, and at last Schacabac, who was really in a most excusable rage at being so elaborately tantalized, feigned to have got flustered, and gave the eccentric old gentleman "a good box on the ear." This put a stop to the joke. The Barmecide was mightily pleased with the patient humor of his guest, a visible dinner was immediately ordered up, and Schacabac now enjoyed in reality what he had previously partaken of only in imagination.

BAR'MEN, a most charming valley, about leagues in length, on the Wupper, about 2 leagues from Elberfeld, in the province of Rhenish Prussia. It is divided into upper and lower B., and contains five towns or villages, which united form the town of B., now continuous with Elberfeld, with (1875) 86,504 inhabitants, chiefly Protestants. Nowhere in Germany is so much manufacturing industry accumulated in a single spot. B. is the principal seat of the ribbon-manufacture on the continent. Its fabrics go to all parts of the world. It produces linen, woolen, cotton, silk, and half-silk ribbons, cloth of various kinds, stay-laces, thread, etc. It has also considerable manufactures of soap, candles, metal wares, buttons, machinery, and pianofortes. There are, besides, in the valley, numerous bleachfields and Turkey-red dye-works. Lower B. has a mineral spring and a bathing establishment.

BARNABAS, SAINT, properly Joses, mentioned in the Acts of the Apostles as a fellow-laborer of Paul, and even honored with the title of apostle. He is also supposed to have founded the first Christian community at Antioch. According to tradition, he became the first bishop of Milan, but he is differently reported to have died a natural death, and to have suffered martyrdom at the hands of the Cypriot Jews, 61 A.D. The epistle ascribed to him is of very doubtful authenticity.

BARNABAS, SAINT, EPISTLE OF. This epistle contains 21 chapters. Its aim is obviously to strengthen the faith of believers in a purely spiritual Christianity. It commences by declaring that legal sacrifices are abolished, and then proceeds to show, though not in a very coherent or logical manner, how variously Christ was foretold in the Old Testament. In the 10th chapter, it spiritually allegorizes the commands of Moses concerning clean and unclean beasts; in the 15th, it explains the "true meaning" of the Sabbath; and in the 16th, what the temple really prefigured. This concludes what may be termed the doctrinal portion of the epistle; the remainder, which is of a practi-

cal character, describes the two ways of life—the way of light and the way of darkness, and closes with an exhortation that those who read it may so live that they may be blessed to all eternity. It is a simple, pious, and earnest work; but makes a far more judicious use of the New Testament than of the Old.

BARNABITES, an order of monks which sprung up at Milan in 1530. They were so called because the church of St. Barnabas in that city was granted them to preach in. They were approved of by pope Clement VII. and pope Paul III. Their special duties were, to attend the sick, to preach, to instruct the young, and to take the charge of souls. They soon established themselves in Italy, France, Austria, and Spain, and enjoyed the privilege of teaching theology in the schools of Milan and Pavia. Many eminent men have been sent forth by them. Besides the three usual monastic vows, they took a fourth, viz., not to sue for church preferments. In France and Austria they were employed in the conversion of Protestants; but they have now, as a body, almost fallen into oblivion. Only a few monasteries exist here and there in France and Italy.

BARNABY LECTURES, of the university of Cambridge, where four persons are chosen annually on St. Barnabas day to lecture on mathematics, philosophy, rhetoric, and logic.

BARNACLE, or BERNICLE, *Lepas*, also called *Anatifa* and *Pentalasmis*, a kind of shell-fish, a genus of *cirrhopoda* (q.v.), the type of a family of articulate animals distinguished by a long flexible stalk or peduncle, which is provided with muscles, upon the summit of which, in the true barnacles, are shelly valves five in number, inclosing the principal organs of the animal, and opening and closing on one side like the opercular valves of *balanus* (q.v.), to admit of its spreading out and retracting its net—an apparatus similar to that by which the animals of that genus obtain their food. Barnacles abound in almost all seas, attaching themselves in great numbers to logs of wood, ships' bottoms, etc. They grow very rapidly. Some of the species are eaten in some parts of the world, and perhaps they were among the *balani* which the ancient Romans esteemed a delicacy.—In some cirrhopods, very nearly allied to the true barnacles, and resembling them in general form, the shelly valves almost entirely disappear.

In former times, the B. was supposed to be the embryo of a goose or bird of some kind; a notion which doubtless arose from a fancied resemblance between the convolutions of the fish in its shell and the embryo of a bird in the egg. It was, therefore, believed that the barnacle goose, described in next article, sprung from these marine shells. Hollinshed gravely affirms that such was the case; and the most learned men of their time were weak enough to give credence to the absurdity. Gerard, in his *Herbal* (1597), declares, that after "a thing in form like a lace of silke finely woven, as it were, together"—which he correctly enough states to be "the first thing that appeareth" when "the shell gapeth open"—there next follow "the legs of the bird hanging out;" and at last the bird, increasing in size, "hangeth only by the bill," and "in short space after it cometh to full maturity, and falleth into the sea, where it gathereth feathers, and groweth to a fowl bigger than a mallard, and lesser than a goose," etc. All this was represented as constantly taking place on the coast of Lancashire and the Hebrides, and continental writers of greater name reported in like manner the same fable, against which Ray and other early naturalists were obliged seriously to argue. The B., however, really undergoes transformations not less wonderful than the fabled ones, which have rendered it an object of so much interest. See CIRRHOPODA.

BARNACLE GOOSE, or BERNICLE GOOSE, often also called BARNACLE, or BERNICLE (*anser bernicla* or *leucopsis*), the bird which the fables of former days represented as deriving its origin from the cirrhopod of which it bears the name. It is in size smaller than the common wild goose, being only a little more than 2 ft. long, and about 5 lbs. in weight. It is very prettily marked, having the forehead, cheeks, and throat white, the bill black, and a black stripe extending from it to the eye; the crown of the head, neck, and upper part of the breast black; the rest of the plumage on the upper parts of the body chiefly ash-gray and black, in undulating bars—on the lower parts, white. It is a common winter visitant of the western coasts of Britain and of Ireland, but in the eastern parts of Britain it is rare. It retires in spring to more northern regions, where it breeds, vast numbers passing northward along the coast of Norway to the Arctic ocean. It is highly esteemed for the table.

The brent goose, or brent barnacle (*anser brenta* or *torquatus, A. bernicla* of some naturalists), has frequently received the name of the B. G., and no little confusion has existed concerning them in books of science, although the birds are sufficiently distinct. The bent goose is smaller than the B. G., being only about 21 in. in length. It is also of much darker plumage, the whole head, throat, and neck being black, except a small patch on each side of the neck, which is white, mixed with a few regularly placed black feathers; the upper parts of the body generally almost black, and the lower parts slate-gray, except the vent and under tail-coverts, which are white. It is remarable for length of wing and powerful flight, and for its distant migrations. It is very common in winter on the British shores, but breeds in high northern latitudes. It is a winter-bird of passage in the United States and Canada, as in Britain and on the continent of Europe. It is excellent for the table.

Very nearly allied to these species is the red-breasted goose, or red-breasted barnacle (*anser ruficollis*), a beautiful bird, of which the neck and upper part of the breast are of a rich chestnut red. In size, it resembles the brent goose; it is a very rare visitant of Britain and of the continent of Europe, and is abundant only in the extreme n. of Asia.—Another species, called Hutchins' goose or barnacle (*A. Hutchinsii*), of dark plumage, and with a triangular patch of white on each side of the head and neck, is abundant in Hudson's bay, and the extreme n. of America.

These species are regarded by some naturalists as constituting a genus *bernicla*, distinguished chiefly by a shorter and more slender bill from the ordinary or true geese.

The Egyptian goose or bargander (*anser Egyptiacus*) is sometimes ranked with these, sometimes made the type of a distinct genus, *chenalopex*, upon account of the longer bill, a short spur with which the bend of the wing is armed, and the anatomical peculiarity of a hollow bony enlargement at the bottom of the trachea of the male. It has long been kept in parks and pleasure-grounds in Britain, chiefly on account of the beauty of its plumage, and has become partially naturalized. It is a little smaller than a common goose; its voice more resembles that of a wild-duck. The prevailing colour of the plumage is light chestnut-brown, minutely rayed with darker lines; the neck and part of the wings are white. Large chestnut patches surround the eyes. It is very abundant on the Nile, and is frequently figured in Egyptian sculptures. It is much esteemed for the table, and was kept and fattened for it by the ancient Egyptians. It is the *chenalopex* of Herodotus.

BARNACLES, in heraldry, resembling what are now called twitchers, were instruments used by farriers to curb and command unruly horses. B. are frequently introduced into coats of arms as a charge.—The term BARNACLES, applied to spectacles, is derived from *beryllus*, a transparent stone; dim. *beryllicula, berynicula, bernicula*. Old Fr. has *béricle;* the dialect of Berri, *berniques*. Twitchers resembled the original spectacles that clasped the nose.

BARNARD, FREDERICK AUGUSTUS PORTER, S.T.D., LL.D., L.H.D., b. Mass., 1809; graduated at Yale in 1828; in 1831, teacher in the Hartford deaf and dumb asylum; 1837–48, professor of natural philosophy and mathematics in the university of Alabama, and of chemistry until 1854, when he took orders in the Episcopal church. In 1855, he was professor of astronomy and mathematics in the university of Mississippi, and president of that institution in 1856. He became president of Columbia college, N. Y., in 1864, and is in office now (1880). He was U. S. commissioner to the Paris exposition of 1867, and published a report on machinery and industrial arts, in 1869. He is author of a *Treatise on Arithmetic, Analytical Grammar with Symbolic Illustration, Letters on Collegiate Government, History of the U. S. Coast Survey, Recent Progress of Science, The Metric System*, and various smaller papers. In 1860, he was one of the party sent to Labrador to observe an eclipse of the sun; in 1862, he was at work on the reduction of Gillis's observations of the stars of the southern hemisphere; in 1863, he superintended the publication of maps and charts of the U. S. coast survey; he was president of the American association for the advancement of science in 1860; a member of the board of experts of the bureau of mines in 1865; and a member of the American institute in 1872. He is a member of many distinguished societies in other countries, and also a frequent contributor to home and foreign scientific publications.

BARNARD, HENRY, LL.D., b. Conn., 1811; graduate of Yale; admitted to the bar in 1835; member of the Connecticut legislature, 1837–40, where he labored for common school and prison reform; eight years superintendent of schools, when he improved school buildings, established teachers' institutes, high schools, and a normal school. He was also school commissioner for Rhode Island; in 1857, became president of Wisconsin state university, but soon resigned for ill health; afterwards president of St. John's college, Md.; in 1867–69, U. S. commissioner of education. He is author of six works on schools, and has edited two or more journals in the interest of education.

BARNARD, JOHN, 1681–1770; a graduate of Harvard; chaplain of the Port Royal expedition; was offered appointment as chaplain in England, but refused to conform; ordained at Marblehead, Mass., in 1716, and held that pulpit through his life. He published a version of the Psalms, and was active in promoting the business interests of the town.

BARNARD, Sir JOHN, 1685–1764; an English merchant; represented London in parliament for 40 years; was knighted in 1732, and was lord mayor in 1737. He was the originator of a scheme for reducing the English national debt. There is a statue of him in the royal exchange.

BARNARD, JOHN GROSS, LL.D., b. Mass., 1815; brother of Frederick A. P.; military engineer of West Point, 1833; employed as constructing engineer until 1846, rising to col. of engineers and brevet maj.gen. of the U. S. army. In the Mexican war he fortified Tampico. In 1851, was chief engineer of the Tehuantepec survey; in 1856, superintendent of West Point academy; and for four years in charge of the defense of New York. In the rebellion he superintended the defenses of Washington. On gen. Grant's staff he was chief engineer of the armies in the field, and since the war has been a member of the boards having charge of fortifications and river and harbor obstruc-

tions. He has published *Problems in Rotary Motion, Dangers and Defenses of New York, Notes of Sea Coast Defense, The C. S. A. and the Battle of Bull Run, Artillery Operations of the Army of the Potomac*, etc.

BARNARD CASTLE, an inland t. in the s. of Durham co., on the right bank of the Tees, about 40 m. from its mouth, and 26 m. s.w. of Durham. It stands on the slope of an eminence rising from the river. Its chief manufactures are hats, carpets, shoemakers' thread, leather, plaids, and stockings. It has one of the largest corn-markets in the n. of England. On a rocky height over the river are the ruins (covering 6¾ acres) of a castle, founded about 1180 by Barnard, son of Guy Baliol, a follower of the conqueror, and ancestor of John Baliol, king of Scotland, who was born in the castle, and founded an hospital for the poor in the town. B. C. is the scene of part of sir W. Scott's poem of *Rokeby*. Pop. '71, 4306.

BARNAUL', a t. of w. Siberia, in the government of Tomsk. It is situated at the junction of the Barnaul with the river Oby, and has a pop. of (1867) 12,928, who are chiefly engaged in the mining and smelting of the metals found in the vicinity, which consist of silver, lead, and copper. B. has 120 furnaces at work, is the seat of a mining board, and has a magnetic and meteorological observatory.

BARNAVE, ANTOINE-PIERRE-JOSEPH-MARIE, a distinguished character and victim of the French revolution, was b. at Grenoble in 1761, was the son of an advocate, adopted his father's profession, and early attracted attention in the parliament of Grenoble by the talents which he displayed. A pamphlet which he published against the feudal system led to his being returned as deputy from his province to the states-general in 1789. He zealously advocated the proclamation of the rights of man, was vehement in opposition to the absolute veto, carried through the confiscation of church property to the use of the nation, the emancipation of the Jews, and the abolition of the religious orders, and was mainly instrumental in the liberation of the slaves and reorganization of the colonies. As a leader of the extreme party in the earlier stages of the revolution, he became the idol of the people, and particularly after his victory over Mirabeau, in the question of the power of peace and war, which Mirabeau wished to remain with the king, and B. successfully claimed for the national assembly. He subsequently, however, became inclined to a more moderate course, defended the inviolability of the king's person, and resisted the assertion by the assembly of power to remove ministers. This conduct led to his being regarded as a renegade from the national party, and to his being assailed by the fierce vituperations of the daily press. He retired to his native place on the dissolution of the national assembly; but after the 10th of Aug., 1792, he was impeached, along with Lameth and Duport-Dutertre, on account of correspondence with the court; was brought to Paris, tried before the revolutionary tribunal, condemned, and guillotined on the 29th of Nov., 1793.

BARNBURNERS, a section of the democratic party in New York about 1848, opposed to the extension of slavery, and supported Van Buren for president against Cass, the regular nominee. Their vote, dividing the democratic strength, gave New York, Connecticut, and Massachusetts to Taylor, the whig nominee, and secured his election. The name was suggested by the story of the farmer who burned his barn to clear it of rats. The other section of the democracy in New York was called "Old Hunkers."

BAR'NEGAT, a village in Ocean co., N. J., frequented by sportsmen in search of wild fowl, and peopled chiefly by seamen. It has an academy, and is a good place for sea-bathing

BAR'NEGAT BAY, on the Atlantic, in Ocean co., N. J., 23 m. long and 1 to 4 m. wide, separated from the ocean by Squan beach. At the mouth is a light-house, 39° 45′ 48″ n., 74° 6′ 3″ w., showing a white flashing light.

BARNES, a co. in e. Dakota, crossed by the North Pacific railroad and by the Sheyenne river; 1584 sq.m.; pop. '80, 1615. It is an agricultural region, raising wheat being the chief business. The river affords good water-power. Co. seat, Valley City; pop. 527.

BARNES, ALBERT, an American theologian, b. in the state of New York, in 1798. He was minister of the first Presbyterian church of Philadelphia, from 1830 to 1867. He is best known by his *Notes* on various parts of the Old and New Testaments, specially adapted for the use of Sunday-schools and Bible classes, which have had an extraordinary circulation. Two editions of 18 vols. were published in England, 1860–62. Mr. B. d. at Philadelphia, 1870.

BARNES, ALBERT (*ante*), 1798–1870; b. N.Y.; a theologian; graduate of Hamilton college and of Princeton seminary; licensed to preach in 1823, and after occupying pulpits in several New Jersey towns, was called to the First Presbyterian church in Philadelphia, where he officiated more than 30 years, resigning only because of failing eyesight. He was a thoughtful and spiritual preacher, but is better known for his *Notes* on various books of the Bible, those on the New Testament having at one time a wider circulation than any similar work. Just before he died he had completed a new version of the *Notes*, with many additions, which was published in six vols. in 1871–72. During

the disruption of the Presbyterian church, he was tried for heresy and silenced for a short time, but the accusation failed to command public assent. In the final separation he went with the new school side, and was among the most liberal of their leaders. He was also a firm, though never violent, opponent of slavery. Besides the *Notes*, and many articles in periodicals, B. is author of an introduction to *Butler's Analogy*, *Scriptural Views of Slavery*, *The Way of Salvation*, *The Atonement*, *Claims of Episcopacy*, *Church Manual*, *Lectures on the Evidences of Christianity in the Nineteenth Century*, *Prayers for Family Worship*, several volumes of sermons, and a series of Sunday-school manuals. He was noted for a balanced judgment, and for Christian meekness and fidelity.

BARNES, JAMES, 1806–69; b. Mass.; a graduate of West Point in 1829; a prominent military and civil engineer. In the civil war he was col. and brig. gen. of volunteers, and brevet maj.gen. He was wounded at Gettysburg, and died in Springfield, Mass., from disease contracted in the service.

BARNES, JOSEPH K., b. Philadelphia, 1817, surgeon and brig.gen. in the U. S. army; appointed surgeon in 1856; in 1863, medical inspector; in 1864, surgeon-general.

BARNES, Rev. WILLIAM, poet and philologist, is author of three collections of poems written in the dialect of Dorsetshire, the first entitled *Poems of Rural Life in the Dorset Dialect, with a Dissertation and Glossary* (Lond. 1844); the second, *Hwomely Rhymes*, etc. (Lond. 1859); and the third, *Poems of Rural Life*, etc. (Lond. 1862). The first of these collections reached a second edition in 1847, showing that at least some interest was taken even at that early period in Mr. B.'s "hwomely rhymes." They were not critically noticed, however, so far as has been ascertained, until Nov. 1859, when a highly eulogistic review of them appeared in the *North British Review*, pronouncing Mr. B. to be "the best writer of rustic eclogues since Theocritus." The reviewer also says, speaking of Mr. B.'s poetry, "that it combines in a high degree the special merits of Wordsworth and Burns, but in a way which is so perfectly original, as to bear no trace of even a perusal of those poets by the author." Such praise, although exaggerated, is not altogether without foundation. Mr. B. is a true poet, combining with a genuine love of nature, as seen in the rich grazing-lands of Dorsetshire, a keen sympathy with the rustic population, their hopes and fears, loves, joys, sorrows, and superstitions. It is for this audience that Mr. B. professed to write, and it is only such that can thoroughly appreciate his verse. He has, however, also written a collection of poems, called *Poems of Rural Life in Common English* (1868). Attention was again called to Mr. B.'s poems by a writer in *Macmillan's Magazine* for June, 1862, in an article evidently from the same pen as that in the *North British*, and claiming for Mr. B. a place "at the very head of the properly idyllic poetry of England." In that article, we are informed that in the previous year (1861), the pension-list, which announced a yearly grant of £50 to Mr. Close, in consideration of his deserts *as a poet*, mentioned one scarcely larger in amount conferred on Mr. B. in consideration of his acquirements *as a philologist*. Mr. B. was born of humble parentage at Rush-hay, Bagber, Dorsetshire, in 1810, and was for many years master of the grammar-school at Dorchester. He is B.D. of St. John's college, Cambridge, was ordained in 1847, and was promoted from the curacy of Whitcombe to the rectory of Winterbourn-Came, in Dorset, in 1862. Besides the collections of poems mentioned, Mr. B. is author of *An Investigation of the Laws of Case in Language* (Lond. 1840); *An Arithmetical and Commercial Dictionary* (Lond. 1840); *The Elements of English Grammar* (Lond. 1842); *The Elements of Linear Perspective* (Lond. 1842); *S. Geflysta (the Helper): an Anglo-Saxon Delectus* (Lond. 1849); *Notes on Ancient Britain and the Britons* (Lond. 1858); *Views of Labor and Gold* (Lond. 1859); *The Song of Solomon in the Dorset Dialect, from the authorized English Version* (Lond. 1859)—printed at the expense of prince Louis Lucien Bonaparte; *Tiw, or a View of the Roots and Stems of the English as a Teutonic Tongue* (Lond. 1862); *Early England and Saxon English* (1869). The philological works of Mr. B. show considerable learning and ability.

BARNET, CHIPPING, a t. in the s. of Hertfordshire, on a hill-top, 11 m. n.n.w. of London. Pop. '71, 3720. It was formerly a place of importance on the great northern coach-road. Large cattle-fairs are held here. Here, in 1471, was fought the famous battle of B. between the Yorkists and Lancastrians, in which the latter, after a desperate struggle, were routed, and their leader, Warwick, "the king-maker," killed, by which event Edward IV. was firmly established on the throne. A commemorative obelisk is now erected near the spot.

BARNEVELDT, JAN VAN OLDEN, grand pensionary of Holland, b. 1547, early showed great ardor in the cause of the independence of his country. As advocate-general of the province of Holland, he proved equally his insight into affairs and his address in diplomatic management. Penetrating the secret designs of prince Maurice (q.v.) of Orange, he became the head of the republican party, which aimed at subordinating the stadtholder to the legislature. It was he also who opposed the warlike tendencies of Maurice, concluded (1609) a truce with Spain, and prevented the states-general from taking part in the revolt of the Bohemians. His influence excited the house of Nassau to still greater jealousy, which in the religious controversies between the Remonstrants (see ARMENIUS) and Gomarists degenerated into the bitterest hostility. With the view of obviating a civil war, B. proposed an ecclesiastical assembly, which resulted in agreeing

to a general toleration in respect of the disputed points. The states at first concurred in this wise measure; but the intrigues of the Orange party brought about a change of views by representing the Remonstrants as secret friends of Spain. B., who sympathized with the more tolerant principles of that party, was attacked in scurrilous publications, and was insulted even in the meeting of the states by the mob, with whom Maurice was an idol. The strife between the Remonstrants and Gomarists became hotter every day, and threatened to end in civil war. On Aug. 29, 1618, B. was illegally arrested, along with Grotius and Hoogerbeets, and thrown into prison. In the following Nov., Maurice procured the summoning of the synod of Dort (q.v.), which condemned the Remonstrants with the utmost rigor and injustice. In Mar. 1619, while the synod was still sitting, B. was brought to trial before a special commission of 24 judges, who condemned as a traitor the innocent man to whom his country owed its political existence. It was in vain that his friends and relations raised their voice; equally vain was the interference of the Dowager princess of Orange and of the French ambassador; Maurice was not to be moved. On May 13, 1619, the venerable man of 71 years of age mounted the scaffold, and laid down his head with the same firmness that he had shown through all the events of his life. His sons, Wilhelm and René, were at the same time dismissed from office. Four years after their father's death they took part in a conspiracy against the life of the prince, which, however, was discovered. Wilhelm escaped to Antwerp, but René was seized and beheaded.—See Motley's *Life of B.* (2 vols. Lond. 1874).

BARNEY, Joshua, 1759–1818; b. Baltimore. Before he was 17 years old he was made lieutenant, for gallant service in capturing an English brig in Delaware bay. During the war of the revolution, in which he was three times taken prisoner, but exchanged, he made some important captures, particularly that of the *Gen. Monk*, of 20 guns, off the cape of Delaware in 1782. In that vessel he went to France and brought back a large amount of money, a loan by France to the colonies, and also news that the preliminaries of peace were agreed upon. He was made a captain in the service of France in 1795, but resigned in 1800. In the war of 1812 he commanded the fleet that defended Chesapeake bay, and was wounded in the battle of Bladensburg. In 1818, he started for Kentucky, where he intended to settle, but died on the way.

BARNSLEY, a t. in the West Riding of Yorkshire, 39 m. s.w. of York. It is situated on a hill, has coal and iron mines, linen manufactures, bleaching and dye works, manufactures of iron and steel, wire-works, and glass-works. Besides ample railway communication, it has the advantage of two canals. It has a large number of educational and benevolent institutions, and a public park of about 20 acres. Among the chief buildings are the county court and bank. Pop. '71, 23,021.

BARNSTABLE, a co. in s.e. Massachusetts, including cape Cod and some islands; 290 sq.m.; pop. '80, 31,945. Its surface is low and level. Most of the inhabitants are fishermen and seamen. Co. seat, Barnstable.

BARNSTABLE, a t. and seat of justice of B. co., Mass., on B. bay, 65 m. s.e. of Boston; pop. '80, 4,250. Its inhabitants are mostly fishermen and seamen.

BARNSTAPLE, a t. in n.w. Devonshire, on the right bank of the Taw, 6 m. from its mouth, and 34 n.w. of Exeter. The Taw is here crossed by an ancient bridge of 16 arches, which has been widened by iron-work on each side. In consequence of the river and harbor having become filled up with sand, much of the trade of B. has been transferred to Bideford. It has manufactures of pottery and lace. It sends two members to parliament. B. has existed since the reign of Athelstan, who built a castle here. The poet Gay was born near the town, and educated at its grammar-school. Pop. '71, 11,790.

BARNUM, Phineas Taylor, American showman, was b. at Bethel, Conn., July 5, 1810. His father was a tavern-keeper; and while young B. attended the village school, he traded with and played practical jokes upon his father's customers. At the age of 13, he was employed in a country store; and about five years afterwards, went largely into the lottery business. When only 19, he married clandestinely, and then moved to Danbury, where he edited *The Herald of Freedom*, and was imprisoned 60 days for a libel. In 1834, he removed to New York, where, hearing of Joyce Heth, nurse of gen. Washington, he bought her for $1000, and with the aid of forged documents and puffing, exhibited her to considerable profit. Reduced again to poverty, he sold Bibles, exhibited negro dancers, and wrote for newspapers, until he bought the American Museum in New York, which he raised at once to prosperity by exhibiting a Japanese mermaid, made of a fish and monkey, a white negress, a wooly horse, and finally, a noted dwarf, styled gen. Tom Thumb, whom he exhibited in Europe in 1844. In 1847, he offered Mademoiselle Jenny Lind $1000 a night for 150 nights, and received $700,000 —the concert tickets being sold at auction, in one case for $650 for a single ticket. He built a villa at Bridgeport, in imitation of the Brighton pavilion, and engaged in various speculations, one of which—a clock-factory—made him bankrupt. Settling with his creditors in 1857, he engaged anew in his career of audacious enterprises, and made another fortune. In 1866, he stood as a candidate for a seat in congress, but was unsuccessful. His *Autobiography* (1854, since greatly enlarged) has the merit at least of frankness. In 1865, he published *The Humbugs of the World;* and *Struggles and Triumphs* in

1869. In 1871, he again returned to the business of showman, from which in 1868 he had withdrawn. His exhibition of a "petrified man" in 1878 was not a success.

BARNWELL, a co. in s.w. South Carolina, separated from Georgia by the Savannah river; 1550 sq.m.; pop. '80, 39,858—26,010 colored. The soil is fertile and produces wheat, corn, oats, cotton, rice, etc. Co. seat, B. Court House.

BAROACH', BROACH, or BHARUCH, a large t. of British India, in the province of Bombay. It is situated on an elevated mound, supposed to be artificial, on the n. bank of the Nerbudda. The Nerbudda is here a noble river, 2 m. wide even at ebb tide, but shallow, and the navigable channel winding and difficult even at high water. It abounds in fine fish. B. is a very ancient town; it is supposed to be the *Barygaza* of Arrian. Situated in the midst of a most fertile district, it was formerly a very flourishing town, with a large population; but fell, in consequence of political troubles, into decay. It has of late begun to recover prosperity, and its commerce is increasing. Its present pop. is estimated at 15,000, within the walls; but including the suburbs, which are extensive, the pop. in 1872 was 36,963. B. belonged to the Mussulman kingdom of Guzerat, on the overthrow of which by the emperor Akbar, it was assigned to a petty nawab; and falling under the dominion of the Peishwa, was taken by the British in 1772, ceded to Scindiah in 1783, in acknowledgment of the kind treatment of some British prisoners; and again stormed by a British force in 1803, since which date it has remained in the possession of the British. The heat of B. is often excessive, and the situation is regarded as unhealthy. B. carries on a considerable trade with Bombay and Surat—the principal exports being raw cotton, grain, and seeds. It was long famous for its manufactures of cloth; but that of the finer kinds has fallen off very much, in consequence of the importation of English goods. Many of the weavers of B. are Parsees, of whom also some are of the more opulent classes—as ship-owners and ship-brokers. B. has one remarkable institution—a Brahmanical hospital for sick animals, into which horses, dogs, cats, monkeys, peacocks, and even insects are received. It is ostensibly attended by a number of Brahmans, who derive a good income from lands devoted to it, and from voluntary contributions. Pop. of collectorate (1872) 350,322.

BAROC'CHIO, or BAROZZI GIACOMO DA VIGNOLA, 1507–73; an Italian architect, who succeeded Michael Angelo as the architect of St. Peter's, and constructed other great works in Rome. He also supplied the designs for the Escorial. His *Five Orders of Architecture* is an excellent and useful work.

BAROCHE, PIERRE-JULES, an eminent French politician, was b. at Paris on the 8th Nov., 1802. He passed as an advocate in 1823, and distinguished himself by his talents as a pleader. In 1847, he was sent to the chamber of deputies as representative of Rochefort, took his position among the moderate reform party, and was one of those who signed the accusation drawn up against the Guizot ministry. During the republic, he voted at first along with the democratic party, but subsequently supported gen. Cavaignac, and, after the 10th Dec., the politics of Louis Napoleon. B. was now made procureur-général of the republic at the Paris appeal court. In Mar., 1850, he succeeded Ferdinand Barrot as minister of the interior, after which he became a decided Bonapartist. In April, 1851, he was appointed minister of foreign affairs, with Leon Faucher as colleague. After the *coup d'état* of the 2d Dec., 1851, B. accepted the vice-presidency of the consultative commission, and was authorized to make known officially the result of the *plebiscitum*. He became minister of foreign affairs in 1860, and minister of justice and public worship in 1863. He received the grand cross of the legion of honor in 1855. His death took place on the island of Jersey in 1870.

BARO'DA, a city of Guzerat, and capital of a state of the same name. It is 40 m. from Tunkaria and 231 n. of Bombay, with which it is connected by railway. It stands on the Biswamintri, which is here crossed by a stone bridge of singular construction—an upper range of arches resting on a lower one. B. is the residence of the Guicowar, a protected Mahratta prince. Pop. '72, 112,057; trade considerable. It occupies an important position between the coast and the interior. In 1873, numerous complaints having been made to the British government about the misrule of the Guicowar, Malhar Rao, a commission was appointed to examine into the state of affairs, and as a result the Guicowar was allowed 18 months in which to reform his administration. His misrule, however, continued, and a suspected attempt to poison col. Phayre, the British resident at his court, led to his arraignment before a mixed British and native tribunal in 1875. The court was divided in opinion as to his guilt, but the British government deposed the Guicowar for his obvious misrule.

BAR OF DOWER. Dower, the estate or provision which, by the law of England, a widow is entitled to out of the lands and tenements of her deceased husband, may be barred or defeated by her elopement, her divorce on the ground of her own adultery, the treason of her husband, and other disabilities, and by detaining the title-deeds or evidences of the estate from the heir until she restores them. A woman might also, while fines and recoveries were in force, be barred by these assurances, as she now may by the new method of conveyance appointed by the statute 3 and 4 Will. IV. c. 74, in substitution for a fine or recovery, in the case of a married woman. And another method of barring dower is by jointure, as regulated by the statute 27 Henry VIII. c. 10—Stephen's *Commentaries*, vol. i. p. 273. See DOWER, JOINTURE, WIDOW, and FINE OF LANDS.

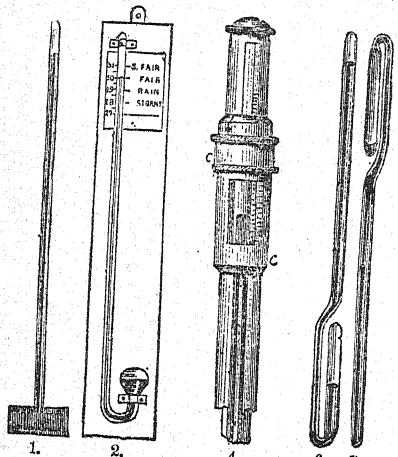
The term corresponding to dower in Scotch law is Terce (q.v.), which may also be barred or excluded in various ways; as, for instance, by the widow's express discharge or renunciation, by the deeds of the husband affecting his real estate, by the husband's conviction for treason, by the wife's express acceptance of a different provision in lieu of the terce, and by her divorce on the ground of adultery.

BAROMETER (Gr. *baros*, weight; *metron*, a measure), an instrument for measuring the weight or pressure of the atmosphere. The term is generally understood to refer to one in which the measure is the height of a column of liquid sustained by atmospheric pressure. The fundamental principle of the construction of the B. is best shown in the experiment which led Torricelli to the first discovery of the pressure of the air. A glass tube, about 33 in. in length, open at one end, is completely filled with mercury, and, being firmly closed by the thumb, is inverted and placed vertically in a cup containing mercury. When the thumb is removed, the mercury sinks in the tube till it stands, generally, about 30 in. above the level of the mercury in the cup, leaving in the upper part a space free of air, which receives the name of the Torricellian vacuum (fig. 1). The mercury within the tube being thus removed from the pressure of the air, while that in the cup is exposed to it, the column falls, till the pressure at the section of the whole, in the same plane as the surface of the mercury in the cup, is the same within and without the tube. A similar experiment is seen when, in a U-shaped tube, having one branch much wider than the other, a column of mercury in the narrow branch balances a column of water nearly 14 times as high in the other. In the Torricellian experiment, we have the air and the space occupied by it taking the place of the wide water branch of the U-shaped tube, and the glass tube and mercury forming the narrow branch, as before; the narrow branch, however, in this case being closed above, to prevent the air from filling, as it were, both branches. In both cases, the heights of the columns are inversely as the specific gravities of the liquids of which they consist; and, as air is about 10,000 times lighter than mercury, we should have the aërial column 10,000 times 30 in. high. It will be found, under ATMOSPHERE, that from the air lessening in density as it ascends, the height is considerably greater. Any changes that take place in the height or density of the aërial column will be met by corresponding changes in the height of the mercurial column, so that as the latter rises or falls, the former increases or diminishes. We have, then, in this simple tube, an infallible index of the varying amount of atmospheric pressure, and, in fact, a perfect barometer. The changes, however, are indicated on a scale at least 10,000 times diminished, so that the variations in the tube show very considerable changes in the weight of the atmosphere. If water be used instead of mercury, the water column would be 14, or, more correctly, 13.6 times as high as the mercurial column, or about 34 ft.; and the scale on which the changes take place would be correspondingly magnified, so that a water B. should be much more delicate than a mercurial one. Water is, however, exposed to this serious objection, that its vapor rises into the empty space above, and causes by its elasticity a depression of the column, the depressions being different for different temperatures. At zero, Fahrenheit, for instance, the depression thus arising would be $\frac{1}{2}$ an inch, and at 77°, more than 1 foot. It would be doubtful, likewise, at the time of any observation, whether the space referred to was filled with vapor of the elasticity corresponding to the observed external temperature or not, so that the necessary correction could not with certainty be made. The vapor of mercury, on the other hand, at 77° F.—a temperature considerably above the average—produces in the B. a depression of only $\frac{1}{1\frac{1}{5}\frac{1}{0}}$ of an inch, an amount practically inappreciable. After 200 years of experience and invention, we have yet no better index of the pressure of the atmosphere than the simple mercurial column of Torricelli, and in all exact observations it is taken as the only reliable standard.

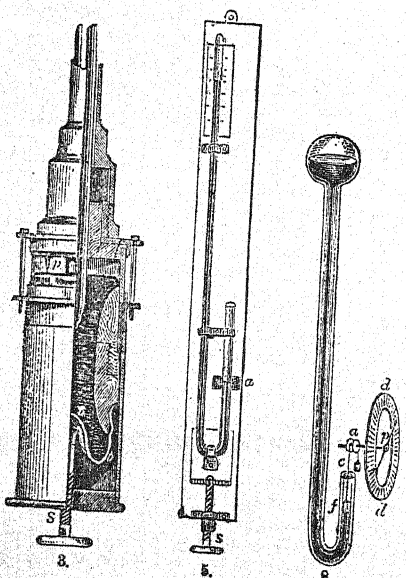
Simple as the B. is, its construction demands considerable care and experience. It is of the first importance that the mercury to be used is chemically pure, otherwise its fluidity is impaired, and the inside of the tube becomes coated with impurities in such a way as to render correct observation impossible. Mercury, as usually sold, is not pure; and before being employed for barometers, must be shaken well with highly dilute but pure nitric acid, to remove extraneous metals and oxides. The same object is effected more thoroughly by keeping it several weeks in contact with the dilute acid, stirring every now and then. After either process, the metal must be thoroughly washed with distilled water, and dried. In filling the tube, it is essentially necessary to get the column free from air and moisture. To effect this, the mercury, after filling, is boiled in the tube, so that air and moisture may be expelled, partly by the heat, and partly by the vapor of the mercury. This process demands great experience and skill, but the same end may be more easily and as effectually attained by boiling the mercury, in the first instance, in an atmosphere of carbonic acid, and then pouring it into the previously heated tube by a filler reaching to the bottom of it. Such care is only expended on the best instruments; ordinary weather-glasses, not needing to be quite accurate, are more simply filled. Notwithstanding all these precautions, minute bubbles of air manage to keep secreted, and creep up in the course of time into the Torricellian vacuum. To obviate this risk of error, an air-trap is recommended by which any air that may accidentally find its way into the tube is arrested in its ascent to the top, and the instrument sustains no damage from the accident.

Barometers are usually divided into two classes—cistern barometers, and siphon barometers. The simplest form of the cistern B. is that shown in fig. 1, which only

requires to be set properly in a frame, and provided with a scale, to make it complete. Fig. 2 presents another form of that class, being that generally seen in weather-glasses or ordinary barometers. The tube is bent at the bottom, and the cistern is merely an expansion of the lower end. Very generally, the cistern is hidden from view, and protected from injury by a wooden cover in front. There are two causes of inaccuracy in cistern barometers—one being the capillarity, which tends to lower the column, and the other being the difference of level in the cistern caused by the fluctuations in the tube, which renders the readings on the fixed scale above at one time too great, and at another too small, according as this level rises above or falls below the original level from which the scale was measured. The effect of capillarity may be avoided by using tubes of more than half an inch in bore, in which the depression becomes so small, that it may be left out of account; and in smaller tubes it may be estimated from tables constructed for the purpose. Wide tubes have the additional advantage, that atmospheric changes are seen earlier in them than in narrow tubes, there being less friction in the former than in the latter. It is worthy of notice that the capillary depression is less in boiled than in unboiled tubes, in consequence of the admixture of a minute quantity of the oxide of mercury, formed in the process of boiling, which lessens the repulsion between the mercury and glass. With reference to the error of level, it must be borne in mind that the height of the column sustained by the atmosphere is always to be reckoned from the lower level. This error becomes all the less the larger the capacity of the cistern is compared with that of the tube, for then a very considerable rise or fall in the tube, when spread over the surface of the cistern, makes only a slight difference of level in it. Care must be taken, then, in ordinary barometers, to make the cistern as large as possible. The only B. in which the error of level is completely obviated, is that invented by Fortin, which, from its being in every respect the most perfect cistern B., deserves particular notice. The cistern, and the lower portion of the tube of this B., is shown in fig. 3. The cistern is made of boxwood, with a movable leather bottom, *bb*, and a glass cylinder is inserted into it above, all except the glass being incased in brass. In the bottom of the brass box a screw works, on the upper end of which the leather rests, so that by the sending in or taking out of the screw, the bottom of the cistern, and with it the cistern level of the mercury, can be raised or depressed at will. A small ivory pin, *p*, ending in a fine point, is fixed to the upper frame of the cistern; and when an observation is made, the surface of the mercury is made to coincide with the point of the pin as the standard level from which the barometric column is to be measured. The tube of the B.—the upper part of which is shown in fig. 4—is inclosed in one of brass, which has two directly opposite slits in it for showing the height of the column, and on the sides of these the graduation is marked. A brass collar, *cc*, slides upon the tube with a vernier (q.v.), *vv*, marked on it for reading the height with the greatest exactness, and in which two oblong holes are cut, a little wider than the slits in the brass tube. When a reading is taken, the collar is so placed that the last streak of light is cut off by the two upper edges of the holes, or until they form a tangent to the convex mercurial curve. By this means, the observer is sure that his eye is on a level with the top of the column, and that the reading is taken exactly for this point. This is the contrivance usually



1. 2. 4. 6. 7.



3. 5. 8.

adopted to prevent the error of parallax, or that caused by the eye being slightly above or below the top of the column, by which the scale and the top of the column are projected too high or too low, the one upon the other, as the case may be. The only other arrangement worthy of mention for effecting the same object is that by Weber, who etches the scale on a piece of silverized glass placed over one side of the tube; and when—the mirror and tube being vertical—the image of the eye appears along with the vertex of the column, the eye is in the same horizontal line with it. Fortin's B. is generally arranged so as to be portable, in which case the screw, *s*, is sent in until the mercury fills the whole cistern, by which the air is kept from entering the tube during transport, the leather yielding sufficiently at the same time to allow for expansion from increase of temperature. It packs in a case, which serves as a tripod when the instrument is mounted for use. On this tripod it is suspended about the middle, swinging upon two axes at right angles to each other, so that the cistern may act the part of a plummet in keeping the tube vertical—the position essential to all correct measurements.

The siphon B. consists of a tube bent in the form of a siphon, having the same diameter at the lower as at the upper end. Fig. 5 represents a simple form of it. The tube travels along the board on which it is placed by passing easily through fixed rings or collars of brass. A scale, divided in inches and parts of an inch, is fixed on the upper part of the board; and when an observation is taken, the tube is adjusted by the screw *s*, working below it, so that the top of the lower mercurial column may be on a level with the fixed mark, *a*, which is the point from which the fixed scale is measured. In the best forms of the siphon B., both tube and scale are fixed, the latter being graduated upwards and downwards from a zero-point near the middle of the tube, and the height of the column is ascertained by adding the distances from it of the upper and lower levels. The siphon B. is in many respects a more perfect instrument than the cistern barometer. In the first place, the bore at the upper and lower ends of the tube being the same, the depression arising from capillarity is alike for both, and the error from this cause disappears in taking the difference of the heights. In the second place, since the final reading is got from a reference to both upper and lower surfaces, the error in the cistern B. produced by the different capacities of the tube and cistern, is effectually avoided. On the other hand, the taking of two readings, one for each column, is a serious addition to the labor of observation. Gay-Lussac's siphon B. (fig. 6) is bent near the bottom, so as to allow of the lower branch being placed in the same straight line as the upper one—a position highly favorable to accurate observation. When constructed for transport, the tube at the bend is narrowed, as in the figure, to a capillary width, which effectually excludes the air; and when the tube is inverted (fig. 7), being the position in which it is carried, the mercury is nearly all held in the longer branch. Such a tube when mounted, like Fortin's B., makes an excellent traveling instrument, and is comparatively light, from the small quantity of mercury it contains. See ANEROID BAROMETER.

The wheel B., originally invented by Hook, and generally seen as a parlor ornament, has little to recommend it as a trustworthy instrument. Fig. 8 shows the main features of its construction. It is essentially an ordinary B. like the siphon B. below, but having a cistern above, to increase the amount of variation in the lower branch. A small piece of iron or glass, *f*, floats on the open surface, and a thread is attached to it, and passed over a small wheel, *a*, fixed to a horizontal axis, to which it is kept tight by a small weight, *c*, hanging at the other end. A pointer, *p*, is fixed to the other extremity of the horizontal axis, which moves to the right or left of the dial, *dd*, according as the mercury falls or rises in the lower branch. The great sweep which the index takes, as compared with the comparatively minute variations of the mercurial column, is the only merit of this instrument. It is easy to see, that with so much intervening between the mercury and the index, the chances of error from friction and other causes are very considerable.

The correction of the B. for temperature is of importance. Mercury expands $\frac{1}{9990}$ of its bulk for every degree of Fahrenheit's thermometer; consequently, a column of 30 in. at 32° F., or the freezing-point, would, at 65° F., for instance, be $\frac{9990+33}{9990}$ times 30 in., or nearly $\frac{1}{10}$ of an inch longer, for $30\frac{1}{10}$ in. of mercury at 60° produce the same pressure as 30 in. of it at 32°. In order, therefore, that all observations may be compared correctly with each other, the observed heights are reduced to what they would be at 32° F. as a standard temperature. The rule for reduction is very simple: Multiply the number of degrees above or below 32° F. by the observed height, divide the product by 9990, and subtract or add the quotient from or to the observed height for the reduced height. Tables for this purpose have been published by the royal society, from which the corrections are found at once.

The variations of the B. are found to be both periodical and irregular. Periodical variations are those taking place at stated and regular intervals, and irregular, such as have no regular period of recurrence. The only truly periodical variation is the daily one, which varies from 0.150 to 0.001 inch. In most regions of the globe there is also a well-marked annual variation, widely different for different regions. Accidental variations have a range of about 3 inches. See ATMOSPHERE.

The uses of the B. may be classified into physical, hypsometrical, and meteorological. It is of essential use in all physical researches where the mechanical, optical, acoustical, and chemical properties of air or other gases are dependent on the pressure of the atmosphere. Its use in hypsometry, or the art of measuring the heights of mountains, is very valuable. When a B. is at the foot of a mountain, the pressure it sustains is

greater than that which it experiences at the top by the weight of the column of air intervening between the top and bottom. A formula of considerable complexity is given by mathematicians for finding very nearly the true height of a mountain from barometrical and thermometrical observations made at its base and summit, the interpretation of which does not come within the compass of this work. The following rules give very nearly the same result: 1. Reduce the mercurial heights at both stations to 32° F. 2. Take the logarithms of the corrected heights, subtract them, and multiply the result by 10,000, to give the approximate height in fathoms of the upper above the lower station. 3. Take the mean of the temperature at both stations, take the difference between this mean and 32, multiply the difference by the approximate height, and divide the product by 435. This last result is to be added to the approximate height if the mean temperature is above 32, and subtracted, if below, to find the true height in fathoms. A Fortin's or Gay-Lussac's B. is employed in measuring heights.

The best known use of the B. is as a meteorological instrument, or as a weather-glass. Opticians have attached to certain heights of the B. certain states of weather, and at certain points of the scale the words "rain," "changeable," "fair," etc., are marked; but the connection thus instituted is very misleading. Those who have observed most carefully the connection of barometric heights with changes of the weather, discard entirely the use of these terms; and state that it is not the actual height of the B. at any place, but this height as compared with that of surrounding regions which indicates the coming weather. Several elaborate codes of rules have been drawn up to serve as a key to the variations, but as these are more or less of a local character, they would be out of place here. Generally speaking, a falling B. indicates rain, a rising B. fair weather. A steady B. foretells a continuance of the weather at the time; when low, this is generally broken or bad, and when high, fair. A sudden fall usually precedes a storm, the violence of which is in proportion to the barometric gradient. An unsteady B. shows an unsettled state of weather; gradual changes, the approach of some permanent condition of it. The variations must also be interpreted with reference to the prevailing winds, each different wind having some peculiar rules. The connection between changes of weather and the pressure of the atmosphere is by no means well understood. One reason is given, which may to some extent account for the B. being lower in wet than in dry weather—viz., since, as has been shown by Dalton, moist air is lighter than dry air, wherever a large amount of aqueous vapor has displaced a part of the drier air, the barometric column will read relatively low. Hence much depends on the nature of the winds. The s. and s.w. winds, which are, in western Europe, more than any other, the rain-bringing winds, are warm and moist winds. Now, a column of such air, to be of the same weight as one of cold dry air, must be higher; but this it cannot well be in the atmosphere, for no sooner does the warm moist column, by its lightness, rise above the surrounding level of the upper surface of the aërial ocean, than it flows over, and becomes nearly of the same height as the cold air around it. The interchange taking place less interruptedly, and consequently less slowly, in the higher strata than in those near the ground, it is some time before the equilibrium thus disturbed is restored, and meanwhile the B. keeps low under the pressure of a rarer atmospheric column. On the other hand, the northerly and easterly winds, being comparatively cold and dry, are accompanied with fair weather and a high barometer. It is thus to the warmth, as well as to the moisture of these winds that the low pressure is to be ascribed. Hence, then, the rain attendant on a low B., as well as the fine weather accompanying a high B., are the necessary concomitants of our geographical position—of our having the land to the e., and the ocean to the w. of us. In Great Britain a high and rising B. frequently accompanies e. winds with a drenching drizzle; and on the La Plata river, things are the reverse of what they are with us; there the cold s.e. wind, coming from the ocean, brings rain with a high barometer, and the land winds, warmed by the plains of South America, maintain fine weather with a low barometer. That the temperature, as well as the moisture of the air, is at least an important cause of the changes of the B., is also shown by the fact, that, in the tropics, where the variations of the temperature are slight compared with the temperate zones, the B. experiences almost no change. In central Asia, the summer pressure is nearly an inch less than that of winter, and at Deniliquin, towards the interior of Australia, it amounts to 0·250 inch.

BAROMETRIC LIGHT, a faint electric light produced in the vacuum of a mercurial barometer by swinging the instrument to and fro, causing friction of the mercury against the inside of the tube.

BAROMETZ, or Tartarian or Scythian lamb, the prostrate stem (rhizome) of a fern (*aspidium barometz*) which grows in the salt-plains near the Caspian sea. It is shaggy with a silky down, and has a sort of general resemblance to an animal. In the days of ignorant credulity, when the story of the phœnix was received as a truth of natural history, and barnacles were believed to grow into geese, and horses' hairs into eels, marvelous tales were told of the B., which was supposed to partake of the natures of a plant and an animal, to grow on a stalk, and eat grass like a lamb, etc. Erman (*Travels in Siberia*) supposes that the fables regarding the B. may have some connection with the cotton plant.

BARON. This term, as to the origin of which much difference of opinion exists, is probably derived from the Latin word *baro* (allied to *vir*, a man, a hero), which originally signified a stupid, brutal man, afterwards came to signify a man simply, and latterly, by one of those strange transmutations which are not uncommon in language, a man pre-eminently, or a person of distinction. Teutonic, Celtic, and even Hebrew derivations have also been assigned to the word; but the fact of its having been introduced into this country by the Normans, seems in favor of a Romanic origin. It is now the title which we apply to the lowest degree of hereditary nobility. The degree of B. forms a species of landing-place, corresponding amongst noblemen, in a certain sense, to that of gentleman, at a lower stage of the social pyramid. It was in this sense that the word was used in former times to include the whole nobility of England, because all noblemen were barons, whatever might be the higher ranks in the peerage which they occupied. The word peer has recently come to be used with the same signification, perhaps because it is no longer necessarily the case that every nobleman should be a B., there being instances in which earldoms and other honors have been given without a barony being attached to them, and in which the barony has been separated from the higher degree by following a different order of descent. The general theory of the constitution, however, still is, that it is as barons that all the peers sit in the upper house; and it is on this ground that the archbishops and bishops are said to sit in virtue of their baronies. The distinction into *greater* and *lesser* barons seems from an early period to have obtained in most of the countries of Europe. The greater barons, who were the king's chief tenants, held their lands directly, or *in capite*, as it was called, of the crown; whilst the lesser held of the greater by the tenure of military service. The greater barons, who corresponded to the *freiherren* (free lords) of Germany, had a perpetual summons to attend the great councils of the nation; whereas the latter were summoned only in case of their lands embracing a certain extent, which in England was thirteen knights' fees and a quarter. See KNIGHT'S FEE. When the representation of the middle class in England came to be confided to the knights of the shire and burgessess of towns, the minor barons ceased to receive the royal summons, and by degrees the title B. came to be applied to the greater barons, or lords of parliament, as they were called, exclusively. For an account of the barons of England immediately after the conquest, and of the lands which they held, see DOOMSDAY-BOOK. The habit of conferring the rank of B. by letters-patent, by which it was converted into a mere title of honor, apart from the possession of landed property or of territorial jurisdiction, was first introduced by king Richard II., who, in 1388, created John Beauchamp, of Holt castle, B. of Kiderminster. In Germany, the old barons of the empire were for the most part raised to the dignity of *grafs* (counts) and princes; whilst the lesser, in place of passing into the ranks of the untitled gentry, as in England, constituted a grade of the lower nobility, to which no duties were assigned, and scarcely any political privileges belonged.

When a B. is summoned to the house of lords by writ, a letter, in the sovereign's name, directs him to repair to the parliament, to be holden at a specified time and place, to advise with his sovereign, the prelates, and nobles, about the weighty affairs of the nation. On the arrival of the new peer, he is presented by two barons to the lord-chancellor, his patent or writ being carried by a king-at-arms. This having been read by the chancellor, he congratulates him on becoming a member of the house of peers, and invests him with his robe. The oaths are then administered by the clerk of parliament, and the new B. is conducted to a seat on the barons' bench. In addition to barons by writ and barons by patent, barons by prescription are usually mentioned, but incorrectly according to Blackstone, who remarks that "those who claim by prescription must suppose either a writ or patent made to their ancestors, though by length of time it is lost." (Kerr's ed., vol. i. p. 406.) There are some distinctions between a creation by writ and by patent which ought to be mentioned. "The creation by writ," says Blackstone, "is the more ancient way, but a man is not ennobled thereby, unless he actually takes his seat in the house of lords; and some are of opinion that there must be at least two writs of summons, and a sitting in two distinct parliaments, to evidence an hereditary barony." In consequence of the inconvenience thus attending it, the creation by writ may now be considered as obsolete, although the eldest son of a peer is still frequently called up to parliament by means of it, there being in that case no danger of the children losing their nobility even should their father never take his seat. But though creation by patent is thus in general the surest way of insuring the hereditary character of the peerage, it labors under one disadvantage as compared with a creation by writ—viz., that whereas in the latter case the dignity once insured by possession passes to the heirs of the holder without any words to that purpose, in the former there must be words to direct the inheritance, else the dignity endures only to the grantee for life. Where the patent, again, in place of being silent as to the succession, expressly sets forth that the dignity is for life merely, it was held, in the Wensleydale case, that it does not make the grantee a lord of parliament at all.

The coronation and parliamentary robes of a B. differ very slightly from those of an earl. The right of wearing a coronet was conferred on barons for the first time by king Charles II.; their head-dress till then having consisted of a cap of crimson velvet, lined with ermine, and having a plain gold band. A baron's coronet is adorned with six

pearls, set at equal distances on the chaplet. Coronets are worn only on great occasions of state ceremonial. In ordinary garb, there is nothing to distinguish a B. from a commoner. A B. has the title of "right honorable lord," etc., and is addressed as "my lord," or "your lordship." His wife has also the title of "right honorable," and is addressed as "madam," or "your ladyship." A B., in signing, sinks his Christian and family surname, and subscribes his titular designation. His children enjoy the prefix of honorable, as the "honorable"—mentioning Christian and surname. In literature and conversation, a deceased B. is referred to by his Christian name, according to his number in the list of peers of the same title, as "Henry, eighth baron."—The barons of exchequer (q.v.) and of the cinque ports (q.v.) are examples still existing of the ancient barons by office.

In the united kingdom, there are persons who possess the title of B. imparted by some foreign power; as, for example, "baron Rothschild." No such honor can be legally enjoyed without the consent of the sovereign; but at best the title is only honorary, and communicates no special privileges. A good article on the baronage will be found in the *Cyclopædia of Political Knowledge*, published by Bohn, London, 1853. See PEER.

BARON, BERNARD, 1700–62; a French engraver of merit, who lived several years in England, where he died. He engraved for Crozat's collection of prints.

BARON AND FEME, or FEMME. These are two Norman-French words used in English law-books to denominate HUSBAND AND WIFE (q.v.); and see MARRIAGE.

BARON AND FEMME, in heraldry, is the expression used to designate the bearing by which the arms of husband and wife are carried per pale or marshalled side by side on the same shield. The husband's arms are always carried on the dexter side. Where the wife is an heiress—i.e., the representative of her father's house—her husband carries her arms, not *per pale*, but in a shield of pretence; and they are quartered with the paternal coat by the issue of the marriage.

BARON, or BAYRON, MICHAEL, 1653–1729; a French actor, instructed by Moliere. He was also a writer of plays. As an actor he was excellent in tragedy and in comedy, but he was inordinately vain of his personal appearance, and very frequently connected with the scandals of the time. He was stricken with apoplexy while on the stage, and died two weeks afterwards.

BARONET. This title, which is the diminutive of baron, is the lowest degree of hereditary honor in the united kingdom. Baronets were instituted, for the first time, by king James I., on the 22d May, 1611. The ostensible object was to promote the plantation of Ulster, in Ireland, with English and Scottish settlers; but the real aim was to raise money. Each B. was bound to maintain 30 soldiers in Ireland for 3 years, at the rate of 8*d.* per diem for each man; the wages of one whole year to be paid into the exchequer on the passing of the patent. The sum thus exacted, with the fees of honor due to the officers, amounted to upwards of £1000 on each patent. It is a striking proof of the passion for hereditary distinction, that 200 persons were willing to accept the honor on such terms. It was part of the bargain that no title should be created between a B. and a baron, and that the number of the former should be permitted to diminish as the families of the original 200 died out, thus enhancing the value of the title to those that remained. But the latter stipulation was very speedily departed from, and a new commission was appointed to fill up the vacant places, and even to treat with new applicants. Such was the origin of English baronets. From the date of the union, in 1707, those created in England and Scotland were baronets of Great Britain. Irish baronets were created until 1800, since which period all baronetcies are of the united kingdom. There is no limit to the creation of baronets but the will of the sovereign. At investiture there is no ceremony. The rank is communicated by patent or writ, issued under authority of the crown; the fees of office being considerable. There are differences in the terms on which the honor descends (suggested, perhaps, by the recipient according to family circumstances). Sometimes, according to the patent, the rank is confined to direct heirs-male; sometimes it embraces heirs-male collateral; and sometimes, in default of direct male heirs, it passes to the husbands of heirs-female. For the style and privileges of baronets, in matters of ceremony, see Burke's *Peerage and Baronetage*. Baronets have precedence of all knights, except those of the garter, bannerets made under the royal banner in open war, and privy-councilors. They are entitled to have *sir* prefixed to their name, along with B. as an affix. The wife of a B. is legally styled *dame;* but in common speech she is called lady, and addressed as "your ladyship." The rank of B. does not raise a person above the degree of commoner; but many baronetcies have, in course of time, been heritably acquired by peers, which lessens the ostensible number.

Baronets of Scotland and Nova Scotia originated in a project of James I.; but were not instituted till 1625, by Charles I. The professed object was to encourage the settlement of Nova Scotia in North America; and a grant of a certain portion of land in that province, to be held of sir William Alexander, afterwards earl of Stirling, who was then his majesty's lieutenant in Nova Scotia, actually accompanied the title—the grants of land being of course illusory, for their very designations were a fiction. The first person who received the honor of a Nova Scotian baronetcy was Robert Gordon of Gordonstone.

a younger son of the earl of Sutherland, whose patent bears date May 28, 1625. There are no new additions to this branch of the baronetage; the latest creation having been in 1707, the year of the union of Scotland and England. In point of title and popular recognition, there is no distinction between these and other baronets.

BARO'NIUS, CÆSAR, an eminent Roman Catholic ecclesiastical historian, b. at Sora, in Naples, on the 30th Oct., 1538, and educated at Naples and Rome. He was one of the first pupils of St. Philip Neri, who founded the congregation of the Oratory, of which B. became superior in 1593. He soon after became father confessor to the pope, apostolical prothonotary, and finally, in 1596, cardinal, and librarian of the vatican library. On the death of Clement VIII., in 1605, 30 voted in conclave for the election of B. as pope; and but for the opposition of the Spaniards, who were indignant at him for his treatise *De Monarchia Siciliæ*, in which he argued against Spain's claim to that country, he might have been elected. The controversy against the work called the *Magdeburg Centuries* (q.v.), which had already been weakly attempted by Muzio in 1570, seemed at that time the most important undertaking for the learning of the church of Rome. B. entered upon this controversy with great energy and in a position most favorable for access to authorities, composing his *Annales Ecclesiastici a Christo nato ad ann.* 1198 (12 vols., Rome, 1588–1607), in which work he labored till his death, 30th May, 1607. As his object was to prove that the church of Rome has not departed in doctrine or constitution from the Christian church of the 1st c., B. has been accused of not using his authorities according to their proper historical sense, but artfully concealing, obscuring, and falsifying many things—sometimes, perhaps, from ignorance of the Greek, but more frequently with design. His *Annals* have been frequently reprinted, but the reprints are often incorrect and incomplete. The most recent, provided with copious notes, etc., and containing Pagi's *Critical Examination* and Rinaldi's continuation, although not yet entirely correct, is the edition of Mansi (43 vols. 1738–57). The *Critica in Annales Ecclesiasticos Baronii* of Anthony Pagi, the Franciscan (4 vols., Antwerp, 1705, improved by Francis Pagi, Antwerp, 1724), corrects B. in many points, especially of chronology. Among the continuation of the *Annals*, all of which are inferior in value to the work itself, the most rich in matter are that of Bzovius, extending to 1572 (9 vols., Rome, 1616–72), and that of Rinaldi (10 vols., Rome, 1646–77), who availed himself of the materials left by B., for the period from 1198 to 1571. Amongst the other works of B., his publication of the *Martyrologium Romanum* deserves to be noticed (Rome, 1586, and repeatedly).

BARON OF BEEF, a large piece of beef, consisting of both sides of the back, or a double sirloin, and weighing, according to the size of the animal, from 50 to 100 lbs. This monstrously large piece of beef, roasted, is served only on particular festive occasions at the English court, and at great public entertainments. When served according to ancient custom at civic feasts in Guildhall, London, the B. is honored with a distinguished place on a kind of elevated rostrum, where it is ceremoniously carved for the assembled guests. The term B. probably originated in a fanciful allusion to the word sirloin; inasmuch as a *baron* is superior in rank to a *sir*.

BARONS OF THE EXCHEQUER. See EXCHEQUER, COURT OF; COMMON LAW; COMMON LAW, COURTS OF; REVENUE.

BARONY is, or, it may rather be said, was a manorial and hereditary right arising out of land, known to the law both of England and Scotland. In England, manors were formerly called baronies. In the Scotch law, a right of B. is a right in relation to lands which have been erected, or at least confirmed by a clause in crown charters making the grant *in liberam baroniam*, as it is called; and by the crown alone could such a right be conferred. It involved a civil and criminal jurisdiction to which, in theory, all the inhabitants of the B. lands were amenable. But such jurisdiction has, by modern legislation, been so limited and obstructed as scarcely ever to be exercised; and, indeed, in regard to the right of B. itself, the clause in crown-charters erecting baronies has, since the abolition of heritable jurisdictions by the 20th Geo. II. c. 43, become obsolete. But by the 35 Geo. III. c. 122, they are permitted on the sea-coast for encouragement of fisheries, and the bailies thereof (see BAILIE) are to have the powers of justices of the peace. In England, the lord or baron of the manor may hold his COURT BARON (q.v.; see also MANOR, JURISDICTION).

BAROS'MA. See BUCKU.

BAROTSE, a valley in s. Africa, 15° 20′ to 16° 30′ s., and 23° to 24° e., traversed by the Zambesi river, and subject to its inundations. The natives build their villages on natural or artificial mounds to escape this overflow. The Barotses reverence the sun, pray to the alligator, which animal abounds in the river, and believe in some future existence. Their chief town is Narile. The soil of this valley is fertile, and will produce two crops in a year, but not much of it is cultivated.

BARQUE, or BARK, is a name frequently given to ships, but with no very definite meaning. Sometimes it denotes a ship of small size; sometimes a broad-sterned vessel without a figure-head; but more technically it applies to three-masted vessels whose mizzen-sails are fore-and-aft instead of being square. An *armed* B. is one variety of a special sort of vessel noticed in another article. See ARMED SHIP.

BARQUESIME'TO, a city of Venezuela, the capital of a province of the same name, situated on an affluent of the Portuguesa, in a high plain, 156 m. w.s.w. from Caraccas. B. was founded by the Spaniards in 1552; and in the beginning of the 19th c. was a flourishing town, with straight wide streets and some fine buildings, the pop. about 15,000; but in 1802 it was almost totally destroyed by an earthquake. The existing town has been mostly built from the ruins. The pop. is supposed to be about 12,000.—The province of B. extends along the coast of the Caribbean sea, contains an area of 9305 sq.m., and a pop. of about 313,000. Wheat, maize, coffee, cacao, indigo, and cattle are its principal products.

BARR, a t. in Alsace, at the foot of the Vosges, 18 m. s.w. of Strassburg; pop. '71, 5651. In 1592 it was destroyed by the cardinal of Lorraine. Near the t. is Mt. Odilia, on which a daughter (canonized as St. Odilia) of duke Attic of Alsace, established a monastery. The building was sold during the revolution of 1789.

BARR, or BARRA, a petty Mandingo kingdom of western Africa, at the mouth of the Gambia, with an estimated area of about 250 sq. leagues, and a pop. of 200,000, the males being remarkable for their fine proportions. The surface, which is fertile, but rather marshy, is well cultivated.

BARRA, a pleasant suburban t. about 3 m. e. of Naples, with a pop. of 9000. It has numerous fine country residences.

BAR'RA, a small island near the s. extremity of the Hebrides, Scotland, belonging to Inverness-shire, and 42 m. w. of Ardnamurchan point; lat. of Barra-head, 56° 48′ n., long. 7° 38′ w. It is 8 m. long, and 2 to 4 broad, with deep inlets of the sea. A low sandy isthmus, over which the sea nearly breaks at high water, connects the two parts into which B. is divided. The s. or larger part contains a rocky mountain, 2000 ft. high, and is divided into small valleys. The island is formed of gneiss. The soil is sandy, but sheep and cattle are fed on the hill and meadow pastures. Pop. '71, 1563, chiefly Roman Catholics, speaking Gaelic with great purity; and among the most industrious of Scottish fishermen. Their boats are sharp fore and aft, and are built by the fishermen themselves, who engage extensively in the cod, ling, herring, and shell-fish fisheries. Two hundred horse-loads of shell-fish (cockles, limpets, mussels, razor-fish, lobsters, crabs) have been taken off the sands in one day during the summer spring-tides. The lighthouse on Barrahead, the loftiest in Britain, is 680 ft. above the sea, and is seen 33 m. off.—The parish includes several smaller islands, the total pop. of the group in 1871 being 1753.

BARRACKPORE', a native t. and military cantonment on the e. bank of the Hoogly, and 16 m. up the stream from Calcutta. Pop. '72, 9591. From the salubrity of its air, B. is a favorite retreat for Europeans from Calcutta, the governor-general having here his country residence. In fact, B. appears to have long enjoyed this kind of distinction; Mr. Job Charnock, the founder of Calcutta, having erected a bungalow here as far back as 1689. In 1857, B. became famous as the cradle of the formidable mutiny or rebellion of that year. Several regiments of native troops were stationed at B. The men objected to bite off the ends of the cartridges for the Enfield rifle, believing the paper to be polluted by animal fat. The troubles connected herewith—a mere prelude to the fatal outbreak at Meerut in May—commenced about the beginning of February, and continued to assume various degrees of intensity, till at last two regiments of Bengal native infantry had to be disbanded—the 19th, on 31st Mar.; and the 34th, on 5th May. It was in the last-named corps that the first blood would appear to have been drawn, an intoxicated sepoy having attacked and wounded his officer, lieut. Baugh, with sword and pistol. This fellow, whose name was Mungal Pandy, would seem to have had the equivocal honor of giving the local designation of Pandies to the entire body of insurgents.

BARRACKS are permanent structures for the accommodation of soldiers, as distinguished from huts and tents. Originally, the word, derived from the Spanish *barracas*, applied to small cabins or huts; but in England, the term is now always considered to relate to structures of brick or stone. Great opposition was made in this country to the introduction of permanent B. during the early part of the last century, on the ground that the liberty of the subject might possibly be endangered by thus separating the soldiery so completely from the citizens, and placing them in the hands of the ruling power. On the other hand, it was contended that the older system of billeting the soldiers on the people is vexatious and burdensome; and that the morals of towns-people and villagers are liable to be vitiated by the constant presence of soldiers. The permanent B. were few in number down to the year 1792, when George III. obtained the consent of parliament for the construction of several new ones, and for the founding of the office of barrack-master-general. Various changes in the arrangements were made from time to time. The expenditure for B., in building, rebuilding, enlarging and repairing, between 1793 and 1804, was £4,100,000; between 1804 and 1819, £3,220,000; and between 1819 and 1859 (including Aldershott B.), upwards of £7,000,000. It was found that in 17 B., constructed between 1832 and 1857, the cost varied from £27 to £209 per soldier accommodated, according to the inclusion or exclusion of officers' quarters, etc. The funds provided for the construction and maintenance of B. in 1879–80 was £436,850.

The condition of British soldiers has, ever since the disasters in the Crimea in the winter of 1854, been an object of much public solicitude. This solicitude was so strongly expressed as to break through the cold formalities of the official departments. Returns were ordered, and commissions and committees appointed, partly to inquire into existing facts, partly to suggest improvements. The barrack-master-general was replaced at the beginning of this century by commissioners for barracks, whose functions were absorbed by the now extinct board of ordnance in 1822. Barracks are now under the supervision of the surveyor general of the ordnance, who provides for their construction and maintenance through the royal engineers; and for their victualling and daily service through commissaries of the control department. Under these commissaries are barrack-clerks and barrack-sergeants, to assist them in the duties. The furniture of the B. is bought by the war office. The French have a singular plan of *hiring* such furniture at 15 fr. per man per annum; the English cost is about 25*s.* per man, and some of our officers are of opinion that it might with advantage be superseded by the French plan. The barrack-rooms have arm and accouterment racks, shelves, and pegs; with a regular order for depositing everything thereon. During the day, all the bedding is placed in exact array; as well as dishes, tins, and canteens. A subaltern officer visits every room every day. The iron bedsteads are turned down every evening, and up every morning. One non-commissioned officer (sergeant or corporal) has control over each room, and is responsible for quiet, cleanliness, etc. Married women, in the ratio of 6 to a company of 100 soldiers, may live in the B. with their husbands, in separate rooms known as "married soldiers' quarters," but not unless the marriage has been with consent of the commanding officer. The married soldier may, however, sleep out of B., and is allowed an extra 2*d.* per day if he does so. Each soldier in a barrack has an iron bedstead, a rug, a paillasse, a bolster, two blankets, and two sheets; he pays nothing for these. Each soldier has his name and number written near his bed and knapsack.

Notwithstanding the order and regularity established in B., committees of inquiry appointed in 1855 and 1857 ascertained the existence of grievous defects. It was found that, out of 252 B., only 20 had separate sleeping-rooms for married soldiers; the wives of such soldiers, in the other 232, being obliged to put up with arrangements repugnant to all decency and propriety, or else sleep away from the B. altogether.

In regard to sanitary arrangements, great efforts have been made at vast cost in recent years to improve all the hygienic conditions, such as drains, ventilation, means of ablution, recreation, circulation of air, etc. The result has been very apparent in the reduced rate of mortality. Army-physicians recommend 600 cubic ft. of room space per soldier; and this is the standard now demanded in all practicable cases by the war office. It has been estimated that a new barrack for 1000 footguards in London would cost £150,000, *besides land*, the cost of which would depend wholly on the particular site selected. The necessity for grounds for exercises, stores, surgery, offices, etc., renders a barrack a very costly congeries of buildings. Twenty acres may be taken as the minimum space needed for 1000 men. In relation to all the various subjects of barrack-life, a committee of military officers has drawn up a most comprehensive scheme of reform; but unfortunately the cost of making these improvements would be so enormous, that nothing better than a very gradual adoption can be expected.

The finest existing B. in this country are perhaps those at Aldershott, attached to the camp noticed in another article. See ALDERSHOTT CAMP. The buildings extend in two long lines, branching out of the Farnborough and Farnham road, with a large parade-ground between them. The infantry and artillery B. are on the n. side of this space, and the cavalry B. on the south. The infantry B. are divided into blocks, forming each a spacious quadrangle, with a court yard in the center. Each block is a complete barrack for a full regiment, with all the men's rooms, store-rooms, school-rooms, offices, etc. The officers' rooms are, however, separate, and occupy open spaces between the blocks of buildings. All the four sides of each quadrangle are occupied by various rooms and buildings; the men's living and sleeping rooms being mostly on the side next to the parade-ground. The sleeping-rooms, each for 24 men, are very large and airy; the washing-rooms are ample and well-fitted; and the cooking-rooms will each cook for 350 men. Dry play-grounds and drill-yards under glass roofs are provided. A broad balcony outside every range of sleeping-rooms enables the soldiers to look out upon these grounds. The married soldiers and their wives are comfortably provided for, in rooms wholly apart from the rest. The artillery and cavalry B. resemble in their general features those for the infantry.

By the military forces localization act of 1872, £3,500,000 is to be raised and expended in building and adapting B. for the 70 sub-district brigades among which the infantry is now divided.

BARRACKS (*ante*). The "Regulations" of the U. S. army prescribe 225 to 226 sq. ft. of space for every six soldiers, with height of 12 ft., giving each one 450 to 512 cubic feet. There are few masonry-built B. in the United States. Most of them are of logs or lighter timber. Of the more permanent are Madison B., at Sackett's Harbor, N. Y.; Citadel, at Charleston; Pensacola, at Pensacola; Jackson, at New Orleans; Jefferson (now an arsenal), at St. Louis; Baton Rouge arsenal, La.; Mt. Vernon arsenal, Miss.; Oglethorp, at Savannah; Benicia, in California; Carlisle, in Penn.; Ft. Leavenworth,

at Omaha; Newport, in Kentucky; San Francisco; Ringgold and Fort Brown, in Texas. There are B. for marines at the various navy yards.

BARRACOON, the appellation given to a depot for newly captured slaves on the coast of Africa, and where they remain under restraint until carried off by vessels in the slave-trade.

BARRA'DA, or BURADA, a river of Syria, which rising in lat. 33° 50′ n., long. 36° e., flows in a s.s.e. direction towards Damascus, above which it divides, one branch being diverted to irrigate the city and its gardens, while the other passes on the n. side. The branches, which it is supposed were the *Pharpar* and *Abana* of scripture, afterwards unite, and flow into the marshes and lake of Bahr-el-Merj.

BARRAFRAN'CA, a t. of Sicily, in the province of Caltanisetta, about 10 m. s.e. of the t. of Caltanisetta, with a pop. of about 9000.

BARRA MANSA, a t. of Brazil, in the province of Rio de Janeiro, and 70 m. n.w. of the city of that name. It is situated on the right bank of the Parahiba. Pop. 6000.

BARRAS, PAUL-JEAN-FRANÇOIS-NICOLAS, Count de, a distinguished character of the French revolution, was b. at Foy, in Provence, 30th June, 1755. In his youth he served as a lieutenant against the British in India, and after his return home, wasted his property in Paris in dissipation. He eagerly joined the revolutionary party, and was a deputy of the *Tiers Etat* in the states-general in 1789. He was actively concerned in the storming of the Tuileries, was appointed administrator of the department of Var, and afterwards of the county of Nice. In the convention, he voted for the execution of the king without delay or appeal, and on the 31st May, 1793, declared against the Girondists. The siege of Toulon, and triumph of the revolutionary party in the s. of France, were in a great measure owing to his activity and energy; and after the victory, he was deeply concerned in all the bloody measures which were adopted. Yet he was hated by Robespierre and the Terrorists, as one of the less decided revolutionists; and their overthrow was accomplished mainly by him, the convention appointing him commander-in-chief, and virtually investing him with the directorship for the time. While holding this high office, in which he acted with great decision and vigor, and on the same day on which Robespierre fell, he paid a visit to the Temple, and provided for the better treatment of the king's son; he hastened also to the Palais de Justice, and suspended the execution of a large number of persons who had been condemned to death. On subsequent occasions, he acted with decision both against the intrigues of the Royalists and the excesses of the Jacobins; and on 13th Vendémiaire (5th Oct., 1795), being again appointed commander-in-chief by the convention, he called his young friend Bonaparte to his aid, and crushed the sections with merciless discharges of artillery. The directory being appointed in Nov., 1795, B. was nominated one of the five members, and in this capacity he procured the nomination of Bonaparte as commander-in-chief of the army in Italy. It was he who arranged the marriage of Bonaparte with the widow Beauharnais. On 18th Fructidor (see FRUCTIDOR, and FRANCE), he was again invested with the dictatorship, and was again victorious. His authority now became preponderant in the directory, and he affected the pomp of a king, and began to give splendid entertainments in the palace of the Luxembourg. This continued for about two years, till the decline of the power of the directory. After 30th Prairial, Sièyes and he had the whole executive power in their hands; and whilst B. secretly negotiated, it is said, with the Bourbon princes, demanding a large reward for their restoration, Sièyes, in secret understanding with Bonaparte, brought about the revolution of 18th Brumaire. Notwithstanding the favors he had formerly conferred on Bonaparte, he was now, perhaps unavoidably, an object of suspicion to him, was compelled to remove from the neighborhood of Paris, resided in Brussels, then in Marseilles, was banished to Rome, and thence sent to Montpellier, being kept under constant surveillance of the police, and actually found to have been engaged in conspiracies for the restoration of the Bourbons. After the restoration, he returned to Paris, and purchased an estate in the neighborhood of it, where he died on 29th Jan., 1829. He had acquired a considerable fortune in the revolution. His memoirs, which must be of historic importance, were seized by the government.

BARRATRY, COMMON, or, as it is called in old English law-books, *barretry*, is the offense of inciting and stirring up suits and quarrels among the queen's subjects. *One* offensive act of the kind is not sufficient in order to maintain an indictment for this offense; but it must be shown that the party accused *frequently*, or at least on more than *one* occasion, conducted himself in the way imputed; and therefore the principle of the law appears to strike at the *habit* or *disposition* of evil-minded persons, who would incite to quarreling, or busybodies, as they are in fact called in old law-reports; who to use a familiar expression, "set people by the ears." This term is supposed by some to be derived from the French word *barrateur*, which signifies a deceiver; by others, from the Latin word *barratro*, a vile knave. Some, again, account for it by the suggestion that it is made up of *barra*, the bars of courts of justice, and *rettum*, an old word signifying an offense; while, by other antiquarian lawyers it is supposed to have been borrowed from the Normans; the Anglo-Norman *baret* signifying a quarrel or contention. In old English indictments, charging this offense, the accused is not only described as

pacis domini regis perturbator, but also *oppressor vicinorum suorum;* that is, he who is guilty of B., is not only a disturber of the public peace, but a nuisance to his neighbors. The punishment for this offense is fine and imprisonment; but if the offender belongs to the profession of the law, as is too frequently the case, he may besides be disabled from practicing his profession for the future. And, indeed, it is the existing statute law of England, that if any one who has been convicted of B. shall practice as an attorney, solicitor, or agent in any suit, the court, upon complaint, shall examine the matter in a summary way; and if the fact of such conviction be proved, may direct such offending attorney, solicitor, or agent to be kept in penal servitude for not more than seven or less than three years.

Akin to this offense is another of equal malignity and mischief; namely, that of suing another in the name of a fictitious plaintiff. If committed in any of the superior courts, this offense is treated as a high contempt, punishable at discretion, and in inferior courts, by six months' imprisonment, and treble damages to the party injured.

B., in the sense above explained, is not a technical term in the law of Scotland. But in that system there is a word *baratry*, which is defined as the crime committed by a judge who is induced by a bribe to pronounce a judgment, or who barters justice for money.

There is also *baratry of mariners*, which signifies—in the law not only of England and Scotland, but also of France and other European states—the fraud of the master or mariners of a ship tending to their own advantage, but to the prejudice of the owners. Such conduct, however, is one of those risks which are usually insured against in marine policies of insurance. See INSURANCE.

BAR'RE, a t. in Massachusetts, on the Ware river, 21 m. n.w. of Worcester; pop. '80, 2,418. B. is a town of farms and dairies, and has important manufactures, but is notable chiefly for an institution which has been very successful in the training of feeble-minded children.

BARRÉ, ISAAC, b. Dublin, 1726–1802. He was in Wolfe's army as lieut.col., was wounded in the capture of Quebec, and was with Wolfe when he died. In 1761, he was chosen to parliament, where he attracted attention by a violent personal attack upon Pitt, who led the opposition to Bute's administration. In 1765, he opposed the stamp act, supported the appeal of the colonies, and continued friendly to the Americans throughout North's administration. B. held various offices of importance, and was in parliament until 1790, when he retired in consequence of loss of sight. The authorship of the *Junius* letters has been attributed to him, but is not known.

BARRÉGES. See BARÉGES, *ante.*

BARREL (It. *barile;* Fr. *baril* = *barrique*), primarily, a large vessel for holding liquids =probably from *bar*, in the sense of to guard, confine, contain—and then a certain *measure*, but varying in every locality, and almost for every liquid. In the old English measures, the barrel contained 31½ gallons of wine, 32 of ale, and 36 of beer—the wine gallon itself differing from that of ale and beer. In imperial gallons, their contents would be: old wine barrel = 26½ gall.; ale do., 31½; beer, 36½. The Italian barile varies from 7 to 31 English gallons; the French barrique of Bordeaux = 228 French litres = 50 English gallons. Four barriques make a tonneau. In many cases, B. signifies a certain *weight* or other quantity of goods usually sold in casks called barrels. In America, flour and beef are sold on the large scale in barrels: a B. of flour must contain 196 lbs.; of beef, 200 lbs. A B. of butter = 224 lbs.; of soft soap, 256 lbs.; of tar, 26¼ gallons.

BARREL, GUN. The relation which the barrels of small-arms bear to the stock, lock, and other parts, is described in such articles as MUSKET, PISTOL, RIFLE, REVOLVER, BREECH-LOADING ARMS, etc.; but the remarkable processes of manufacturing these barrels may be briefly noticed once for all.

The iron for all good musket-barrels contains a portion of steel, or undergoes some kind of steeling process. Horseshoe nails or stubs, after much violent usage, yield a very tough kind of iron when re-heated; and English gun-makers have been accustomed to buy such refuse on the continent; but the foreign makers now use the old nails themselves; and Birmingham has to rely mostly on various home supplies of old tough iron. The best barrels are now made in England of laminated, twisted, and Damascus steel. To prepare *laminated steel*, Mr. Greener, a celebrated Birmingham gunsmith, collects scraps of saws, steel-pens, files, springs, and steel-tools, from the various workshops; cuts them into small and nearly equal pieces; cleans and polishes them by revolving in a cylinder; fuses them into a semi-fluid state; gathers them into a "bloom" or mass; forges this bloom with a three-ton hammer; hardens and solidifies it with a tilt-hammer; rolls it into rods; cuts each rod into pieces 6 in. long; welds these pieces together; repeats the rolling, cutting, and welding, several times; and thus finally brings the metal into a very hard, tough, fibrous, and uniform state. *Twisted steel* for barrels is made by taking thin plates of iron and steel, laying them alternately one on another in a pile, welding them by heat and hammering, and twisting them by very powerful mechanical agency, until there are twelve or fourteen complete turns to an inch; the length becomes reduced one half, and the thickness doubled by this twisting. *Damascus steel* barrels are made of steel which has undergone a still further series of welding and twisting opera-

tions. *Stub Damascus* barrels are made of a mixture of old files with old horse-nails; the files are heated, cooled in water, broken with hammers, and pounded in a mortar into small fragments; three parts of these fragments are mixed with five of stub; and the mixture is fused, forged, rolled, and twisted. An inferior kind of Damascus-twist is made by interlaying scraps of sheet-iron with charcoal, and producing an appearance of twist, but without the proper qualities. *Threepenny-skelp* and *twopenny-skelp* are inferior kinds of barrel-iron; and the worst of all is *sham-dam skelp*, of which gun-barrels are made for hawking at a cheap price at country-fairs, and for barter with the natives in Africa and the backwoods and prairies of America.

The gun-barrel manufacture of England is now almost wholly conducted at Birmingham and at Enfield, very few barrels being made elsewhere. The best barrels are all twisted into form. The skelps, or long strips of prepared steel, are twisted into a close spiral a few inches long; several of these spirals are welded end to end; and the fissures are closed up by heating and hammering. The rough barrel, with a core or mandril temporarily thrust in it, is placed in a groove, and hammered cold until the metal becomes very dense, close, strong, and elastic. The interior is then bored truly cylindrical by a nicely-adjusted rotating cutting-tool. If, on narrow inspection, the interior is found to be straight and regular, the exterior is then ground on a rapidly revolving stone, and finally turned in a lathe. Commoner barrels are not twisted: the skelps are heated, laid in a semi-cylindrical groove, hammered till they assume the form of that groove, placed two and two together, and heated and hammered until one B. is made from the two halves. See PROOF OF FIRE-ARMS; and RIFLED ARMS.

Common barrels are browned externally with some kind of chemical stain; but the best are rubbed with fine files, and polished with steel burnishers.

BARREL-BULK, a term denoting a measurement of 5 cubic ft., used chiefly in the coasting-trade.

BARREL-MAKING MACHINERY. The saw for cutting staves is a cylindrical sheet, having teeth upon one end; the blocks of wood are clamped in the usual manner, and the staves fall within the cylinder. They are then laid upon an endless conveyer, which carries them against two circular saws that cut them a definite length. Each piece is then placed in a pair of clamps, and moved against a rotary wheel provided with cutters, that dress the edge to the required bilge and bevel; the *bilge* is the increased width midway between the ends, which causes the enlarged diameter of the cask at the middle; the *bevel* is the angle given to the edge conforming to the radius of the cask. The surface of the stave is smoothed by passing it under revolving cutters; a late form of machine takes off the surplus wood from riven staves without cutting across the grain, following winding or crooked pieces as they are split from the block. The heads are usually made of several flat pieces jointed and fastened with dowels, or pins of wood. The edge of each piece is pushed against the side of a rotary disk, provided with cutters that instantly straighten it; it is then pushed against bits that bore holes for the pins to be afterwards inserted by hand. Several boards being pinned together, enough to make a head, the whole is first smoothed on one side and dressed to a uniform thickness; then it is clamped between two disks, and as these disks turn, a saw trims the head into a circle with a beveled edge; if the wood is green, an oval form may be given to provide against shrinking.

The barrel has next to be "set up." A sufficient number of staves are set into a frame, their edges refitted if necessary; stout iron hoops, called "truss hoops," pushed up from below grasp the lower ends tightly, and the whole may be lifted from the mold. One end of the barrel is formed, but the other is open and flaring. A rope is passed about the open end and taken to a windlass, and the staves are drawn together by tightening the rope; in this stage the barrel is heated to cause the staves to yield more easily to their required form. The barrel is now leveled by placing it upon a horizontal bed and bringing down upon it a powerful disk that presses upon its ends and forces the staves into their proper position. A machine is devised which trusses and levels the barrel at a single movement. The slack barrel stands in its truss hoops, two on each end; those of the lower end rest on strong supports; those of the upper end are seized by hooks whose handles pass down through the platform to a common lever; when all the parts are in place, powerful machinery pulls the upper trusses down, at once driving the barrel into the lower trusses, drawing together both ends, and leveling the whole. Each end of the shell, thus made, passes under a rotary cutter which forms a *croze*, or groove, to receive the head, and chamfers, or bevels, the ends of the staves. The heads are put in, and the hoops set by hand. The barrel is then made to turn under a smoothing tool and rapidly finished.

BARREL-ORGAN, an organ (q.v.) in which the music is produced by a barrel or cylinder, set with pins and staples, which, when driven round by the hand, opens the valves for admitting the wind to the pipes according to the notes of the music. The number of tunes that any one instrument can play is, of course, very limited. Barrel-organs are generally portable, and mostly used by street-musicians. A street-organ costs from £30 to £70, according to size. The most perfect barrel-organs are those which are driven by a motive-power, of which the best are made in Vienna, and cost from £100 to

£300. The orchestrion, made by Kaufmann in Dresden, is a large self-acting barrel-organ.

BARREN, a co. in s. Kentucky; 500 sq.m.; pop. '80, 22,321—4,940 colored; the soil is fertile, producing cereals and tobacco. Co. seat, Glasgow. The name comes from "barrens," applied to large tracts that are sparsely timbered.

BARRETT, BENJAMIN FISK, b. Me., 1808; a graduate of Bowdoin, and of Cambridge divinity school; pastor of the First New church (Swedenborgian) of New York, 1840–48, and in Cincinnati, 1848–50; subsequently over a Philadelphia society. His works are *Life of Swedenborg, Lectures on the New Dispensation, Letters on the Divine Trinity, The Golden Reed, A New View of Hell*, etc.

BARRHEAD, a t. of recent growth, in the e. part of Renfrewshire, 6 m. s.w. of Glasgow. It has cotton-mills, and bleaching and print works. Pop. '71, 6209.

BARRI, GIRALDE. See GIRALDUS CAMBRENSIS, *ante*.

BARRICADES are defense-works employed both in the military and naval services. Military engineers, and sappers and miners, are instructed in the art of barricading streets and roads with beams, chains, *chevaux-de-frise*, and other obstacles, either in defending a town against besiegers, or in suppressing popular tumults. In a ship, a strong wooden rail, supported on stanchions, and extending across the foremost part of the quarter-deck, is called a barricade; during a naval action, the upper part of this barricade is sometimes stuffed with hammocks in a double rope-netting, to serve as a screen against the enemy's small-shot. B. have been made use of in street-fights since the middle ages, but they are best known in connection with the insurrections in the city of Paris. As early as 1358, the streets of Paris were barricaded against the dauphin, afterwards Charles V. A more noteworthy barricade-fight was that in 1588, when 4000 Swiss soldiers, marched into Paris by Henry III. to overawe the council of sixteen. would have been utterly destroyed by the populace, firing from behind B., had the court not consented to negotiation; and the result was, that the king fled next day. The next barricade-fight of importance in Paris was that of 1830, which resulted in the expulsion of the Bourbons from the throne of France, and the election of the citizen king, Louis Philippe. During the three days which this revolution lasted, the number of B. erected across the streets amounted to several thousands. They were formed of the most heterogeneous materials—overturned vehicles, trees, scaffolding-poles, planks, building-materials, and street paving-stones, men, women, and children taking part in their erection. In Feb., 1848, the insurrection against Louis Philippe commenced with the erection of B.; but the most celebrated and bloody barricade-fight was that between the populace and the provisional government, which, commencing on the night of the 23d June, 1848, lasted throughout the three following days, when the people had to surrender. The national losses by this fight were estimated at 30,000,000 francs; 16,000 persons were killed and wounded, and 8000 taken prisoners. The emperor Napoleon III. has so widened and macadamized the principal streets of Paris since he ascended the throne, as to render the successful erection of B. next to impossible. There was a remarkable barricade-erection in London in 1821. The ministry desired that the body of queen Caroline should be conveyed out of the country to Germany, for interment, without the populace having the opportunity of making any demonstration. On the matter becoming known, a vast barricade was erected at the point where the Hampstead road joins the new road; and as nothing but the use of artillery could have forced the way, the officer in charge of the funeral cortege deemed it prudent to change his course, and pass through a more central part of the metropolis. During the revolutions of 1848, B. were successfully carried in Paris, Berlin, Vienna, and other places, by abandoning the attack in front, and breaking through the houses of contiguous streets, taking their defenders in the rear.

BARRIE, a t. in Canada, capital of Simcoe co., 60 m. n.n.w. of Toronto, at the w. end of lake Simcoe. It has manufactories of woolen goods; pop. '71, 3298.

BARRIER ACT, the name commonly given to an act of the general assembly of the church of Scotland, 8th Jan., 1697, intended as a barrier against innovations, and a hindrance to hasty legislation. It provides that no change can be made in the laws of the church without being submitted, by that general assembly which first approves it, to the consideration of all the presbyteries, and approved by a majority of them; after which it still remains to be considered by the next general assembly, which then may or may not pass it into a law. The B. A. is regarded as of the greatest importance, both in the established church of Scotland and in the Free church. Analogous regulations have been adopted by other Presbyterian churches.

BARRIER REEF, an immense coral-reef extending along the n.e. coast of Australia for nearly 1300 m., at a distance from the shore of from 10 to upwards of 100 miles. The reef is, in general, precipitous, and in many places rises out of great depths, lines of 280 fathoms having failed to reach the bottom on the outer side. Formerly, ignorance of anything like its precise extent and character led to many shipwrecks, but within the last thirty years it has been surveyed, and pretty accurately laid down on charts. In the course of its length there are several breaks or passages in it. In the voyage from Sydney to Torres strait, the inner route is usually taken. It is narrow,

and requires delicate steering; but it is safe, and not so much exposed as the outer route, which enters Torres strait by Flinders entrance.

BARRING OUT, a practice formerly very common in schools, but now almost, if not altogether, abandoned. It consisted in the scholars taking possession of the school, and fastening the doors against the master, at whose helplessness they scoffed from the windows. The usual time for B. O. was immediately prior to the periodical vacation. It seems to have been an understood rule in B. O. that if the scholars could sustain a siege against the master for three days, they were entitled to dictate terms to him regarding the number of holidays, hours of recreation, etc., for the ensuing year. If, on the other hand, the master succeeded in forcing an entry before the expiry of that period, the insurgents were entirely at his mercy. The masters, in most cases, appear to have acquiesced good-humoredly in the custom; but some chafed at it, and exerted their strength and their ingenuity to storm or surprise the garrison. Addison is said to have been the chief actor in a B. O. of the master of Lichfield. One remarkable and fatal case of B. O. occurred at the high school, Edinburgh, in Sept., 1595. The scholars had to complain of an abridgment of their usual holidays by the town-council, who, on being remonstrated with, refused, even though the claim was supported by the master, to grant more than three of the eight days which the boys demanded as their privilege. They, accordingly, took advantage of the master's temporary absence to lay in a store of provisions, and having done so, they barricaded the doors. The magistrates, the patrons of the school, in vain sought admission, the boys saying they would treat with their master only; and after a day and night had passed, it was resolved to force an entrance. The result was, that one of them, Bailie Macmoran, was shot dead on the spot by a scholar named Sinclair. The scholars of Witton school, Cheshire, were directed by the statutes drawn up by the founder, Sir John Deane, to observe the practice: "To the end that the schollars have not any evil opinion of the schoolmaster, nor the schoolmaster should not mistake the schollars for requiring of customs and orders, I will that upon Thursdays and Saturdays in the afternoons, and upon holy-days, they refresh themselves—and a week before Christmas and Easter, *according to the old custom, they bar and keep forth the school the schoolmaster, in such sort as other schollars do in great schools.*" This school was founded in 1558. See Brand's *Popular Antiquities*, Chambers's *Domestic Annals*, and Carlisle's *Endowed Grammar Schools*.

BARRINGTON, Daines, 1727–1800; third son of John Shute; antiquary and naturalist. He followed the law, and wrote *Observations on the Statutes from Magna Charta to 21st James I., being a Proposal for Remodeling them*," a work of high reputation. In 1771, he published *Orosius* in English, with king Alfred's Saxon version; and two years later, *Tracts on the Probability of Reaching the North Pole*. Among his most curious productions is *Experiments and Observations on the Singing and Language of Birds*.

BARRINGTONIA'CEÆ, a natural order of exogenous trees and shrubs, natives of tropical countries, and generally very beautiful both in foliage and flowers. Few plants, indeed, exceed some of them in beauty. The stamens are very numerous, and form a very conspicuous part of the flower. The fruit is fleshy, with bony seeds lodged in pulp. That of some species is eaten, as *careya arborea*, an Indian tree, the stringy bark of which is used in the countries along the foot of the Himalayas as a slow-match for matchlock guns. Humboldt and Bonpland mention that children become quite yellow after eating the fruit of an American species, *gustavia speciosa*, of which, however, they are very fond; but that this color disappears in a day or two. The Moordilla (*barringtonia speciosa*) is described by Sir J. E. Tennent as a tree which much attracts the attention of travelers in Ceylon. It has dark, glossy leaves, and delicate crimson-tipped white flowers. "The stamens, of which there are nearly 100 to each flower, when they fall to the ground, might almost be mistaken for painters' brushes." Some botanists include this order in *myrtaceæ* (q.v.).

BARRISTER, Revising. See Revising Barrister.

BARRISTERS, or Barrasters, as sometimes spelt in old books. This is the distinctive name by which the advocates or pleaders at the English and Irish bars are known; and thus its derivation is perhaps sufficiently accounted for. They are admitted to their office under the rules and regulations of the Inns of Court (q.v.), and they are entitled to exclusive audience in all the superior courts of law and equity, and generally in all courts, civil and criminal, presided over by a superior judge. In the whole of the county courts, attorneys are allowed to practice without the assistance of counsel; also at petty sessions, though at the quarter sessions where four counsel attend, the justices always give them exclusive audience. In Scotland, the same body are styled Advocates (q.v.), and they have the same exclusive privileges that B. enjoy in England and Ireland. These Scotch advocates, however, are members of the faculty of advocates, or Scotch bar, properly so called, and are not to be confounded with the advocates who practice under that name in the town and county of Aberdeen, and who, as explained in a former article, are merely country attorneys. See Attorneys and Solicitors.

Barristers were first styled *apprentices*, who answered to the bachelors of the universities, as the state and degree of a sergeant did to that of a doctor. These apprentices or barristers seem to have been first appointed by an ordinance of king Edward I. in parlia-

ment, in the twentieth year of his reign (Stephen's *Commentaries*, vol. i. p. 17, and authorities there referred to). Of barristers, there are various ranks and degrees, and among each other they take precedence accordingly; the general name, "counsel," being, in the practice of the court, common to them all. But they may be divided into three leading bodies. 1*st*, barristers simply or utter barristers, who occupy the position of junior counsel, wearing a plain stuff-gown and a short wig; 2*d*, *sergeants-at-law*, a legal order of very ancient state and degree, and who are distinguished by the *coif* and other peculiarities (see SERGEANT-AT-LAW); and 3*d queen's counsel*, or her majesty's counsel learned in the law, as they are more formally called, and who may be selected either from the outer or junior bar, or from the sergeants. They may be described as the ordinary leaders of the bar, and are distinguished by a silk gown, and on state-occasions, and always in the house of lords, they wear a full-bottomed wig. For further details, see QUEEN'S COUNSEL. Besides these three orders or gradations of rank at the English bar, the crown sometimes grants letters patent of precedence to such barristers as her majesty may think proper to honor with that mark of distinction, whereby they are entitled to such rank and pre-audience as are assigned to them in their respective patents. See PRECEDENCE.

Thus constituted, the English bar perform their functions, enjoying many professional privileges and immunities, and a high social position. As we have before stated, they have exclusive audience in all the superior courts, whereupon terms and conditions, and according to an etiquette, which are all well understood by attorneys or solicitors, they take upon themselves the protection and defense of any suitor, whether plaintiff or defendant. With the *brief* (q.v.) or other instructions, by means of which their professional services are retained, B. receive a *fee*, or such fee is indorsed on the brief or instructions, and afterwards paid. Such, generally, is the existing practice at the English bar, differing in this respect from the practice of the bar in Scotland—and, we believe, to a great extent in Ireland also—where *pre*-payment of the fee is the rigid etiquette. The amount of this fee in England depends, of course, on the nature of the business to be done, the time to be occupied, and the labor to be bestowed; and it is usually, especially in the case of leading counsel, a liberal sum. The barrister's fee, however, is not a matter of express contract or stipulation, recoverable at law like an attorney's bill of costs, but is regarded as a mere honorary reward—*guiddam honorarium*, as it is called in law-books. There is, therefore, no means of enforcing its payment, and indeed, in this respect, the barrister has nothing to rely upon but the honor and good faith of those who employ him. Where, however, it can be proved that the client or party gave money to the solicitor or attorney, with which to fee the counsel, the latter may maintain an action against the former for the amount in some special cases.

In order to encourage due freedom of speech in the lawful defense of their clients, and, at the same time, to give a check to unseemly licentiousness, it has been held that a counsel is not answerable for any matter by him spoken, relative to the cause in hand, and suggested in his client's instructions, although it should reflect upon the reputation of another, and even prove absolutely groundless;* but if he mentions an untruth of his own invention, or even upon instructions, if it be impertinent to the cause in hand, he is then liable to an action from the party injured; and counsel guilty of deceit or collusion are punishable by the statute Westm. I. (3 Edw. I., c. 28) with imprisonment for a year and a day, and perpetual silence in the courts—a punishment which may be inflicted for gross misdemeanors in practice, although the course usually resorted to is for the benchers of the inn of court, to which the person so offending belongs, to *disbar* him. See Stephen's *Commentary*, and Ker's *Blackstone*, and see BENCHERS and DISBAR.

But besides advocacy and forensic disputation, B. in England have other business to which they have extended their practice, to the great advantage of the public. This additional practice consists in advising on the law by their opinion on a case stated, by means of which harassing and fruitless litigation is often prevented (see OPINION OF COUNSEL); in drawing or preparing the pleadings or statement of facts on which an action or suit is founded (see PLEADING); and in preparing the drafts or scrolls of legal instruments, indentures, deeds, contracts, or other conveyances. See CONVEYANCING and CONVEYANCER. As a correlative privilege of the position in which they stand in respect of their fees, barristers are not personally liable for the injurious consequences of any erroneous advice they may give; and they claim absolute control over the conduct of all litigation in which they may be engaged, even to withdrawing it from court, unless the client expressly dissent; and until lately, it was the opinion of the profession that counsel might at any time, during the progress of a cause, compromise the matter in dispute; but the exercise of such discretion was successfully opposed in a recent case, and it is now admitted that B. have no *ex officio* privilege beyond the guidance and conduct of actual litigation in court.

It is from the body of B. that all the judges in England, superior and inferior, are appointed; and B. are also always chosen for the office of paid magistrate. The only exception to the exclusive appointment of B. to judicial offices, is the case of justices at petty and quarter sessions, chiefly a criminal jurisdiction, but which works well in practice, and has many claims to consideration. See QUARTER SESSIONS.

* But the publication of the counsel's statement by a *third party* may expose such third party to an action.

The bar in Ireland stands on the same footing, and has the same ranks and degrees, and is subject very much to the same rules and regulations, as the English bar; and in that country, barrister also is the name by which the profession of an advocate is distinguished. In Scotland, the same office is simply called by its own name of *advocate*. See ADVOCATES, FACULTY OF.

At the bar of the house of lords, and before parliament generally, before the privy-council, and also, it is believed, in all trials for high treason, whether in England, Ireland, or Scotland, the three bars rank on a footing of equality, taking precedence according to the date of their call and admission to their own respective bars, with the exception of those who are queen's counsel, who recently have also been introduced into Scotland, and now are next in precedence to the lord advocate (see ADVOCATE, LORD), the *solicitor general of Scotland* (q.v.), and the *dean of faculty* (q.v.). It was at one time disputed between the lord advocate of Scotland and the attorney-general of England, which of them should lead the other at the bar of the house of lords; and a case occurred in 1834 in the house of lords, before lord chancellor Brougham, in which very high pretensions were urged on behalf of both functionaries. These were the late lord chancellor Campbell as attorney-general, and the late lord Jeffrey as lord advocate, who contended that as he was not only the first law-officer of the crown in Scotland, but also a high political officer, he was entitled to lead the former. But the house decided that the attorney-general of England has precedency over the lord advocate of Scotland, in all matters in which they may appear as counsel at their lordships' bar; and it is presumed that the same rule would be followed before parliament generally, the privy-council, and in all trials for high treason, whether in England, Ireland, or Scotland. The relative rank of the *Irish* law-officers to English is the same.

It only remains to be added, that as the three bars are on a footing of equality in the house of lords, and the other imperial and supreme tribunals above mentioned, the English bar have no exclusive audience in these, even in English cases; but all causes whatever there, whether English, Irish, Scotch, or colonial, may be equally and indiscriminately taken and advocated by English, Irish, or Scotch counsel.

BARRON, a co. in n.w. Wisconsin, on the upper streams of Red Cedar and Hay rivers; 1080 sq.m.; pop. '75, 3337. It is for the most part covered with forests. Productions, agricultural. Co. seat, Barron.

BARRON, JAMES, 1768–1851; b. Virginia; commodore in the United States navy and son of a commodore of the same name. B. commanded the *Chesapeake* when the British ship *Leopard* undertook to search her for deserters, June 22, 1807. B. resisted, but his vessel was in no condition to fight, and he was compelled to surrender. This act precipitated war with England. B. was suspended and tried on various charges, but not convicted. After some years spent in merchant service, he sought restoration to the navy, but found many of the officers opposed to him, among them Decatur, whom B. challenged, and they fought at Bladensburg, Mar. 22, 1820. At the first shot both fell; Decatur died in a few hours, and B. recovered some months later. In late life B. was in office on shore duty, and was offered but declined the command of the Pacific squadron. At his death he was the oldest naval officer of the United States.

BARRON, SAMUEL, 1763–1810; b. Virginia, brother of James. He was conspicuous in the war with Tripoli, but in consequence of ill health resigned his command in favor of commodore John Rogers. Just before his death B. was made commander of the Gosport navy yard.

BARRON, SAMUEL, b. Virginia; an American naval officer who went over to the confederacy in 1861. He was in the *Brandywine* when she took Lafayette to France in 1825, and became captain in 1855. When Fort Hatteras was taken, Aug. 29, 1861, B. was made a prisoner, but exchanged in 1862, and went to England to fit out privateers. After the war he engaged in farming in Virginia.

BARROS, JOÃO DE, the most distinguished of Portuguese historians, was born of an ancient and noble family at Viseu in 1496; became a page to king Emmanuel, and afterwards companion to the crown Prince. He pursued his classical and other studies with great diligence, and wrote a historical romance in his 24th year, which attracted much admiration by the peculiar beauty of its style. Hereupon the king assigned him the task of writing the history of the Portuguese in India, which he undertook, but of which only the first three decades proceeded from his pen, under the title of *Asia Portugueza* (Lisb. 1552–63); the continuation extending to twelve decades, was the work of Diego de Couto. (A new edition of the whole appeared at Lisbon, in 8 vols., in 1778–88.) B. was for some time governor of the Portuguese settlements in Guinea, and afterwards treasurer and general agent for the Indies. In 1539, the king bestowed on him the province of Maranhao in Brazil, that he might found a colony there; but he was obliged to renounce the enterprise after much loss. He died at his estate of Alitem on the 20th of Oct. 1570.

BARROSA, a village of Spain 16 m. s.s.e. of Cadiz, celebrated in history as the place where gen. Graham (afterwards lord Lynedoch), in Mar. 1811, with a handful of English troops, succeeded in gaining over the French, after his Spanish allies had retreated, one of the most glorious victories of the Peninsular campaign. More than 2000

French were killed and wounded (some authorities give nearly 3000 killed alone), 300 prisoners taken, 6 pieces of cannon, and an eagle—the first captured in the war.

BARROT, CAMILLE HYACINTHE ODILLON, a French jurist and statesman, son of a member of the convention, and afterwards of the council of five hundred, was b. at Villefort, Lozère, 19th July, 1791. In 1814, he became an advocate in the court of cassation, Paris, and soon acquired a high reputation as an eloquent pleader. Entering the chamber of deputies young, he in time came to be regarded as one of the most influential leaders of the liberal opposition. At the revolution of 1830, he was one of the three commissioners appointed by the provisional government to accompany Charles X. from Rambouillet to Cherbourg, on his embarkation to England. Under the new government, he was appointed prefect of the department of the Seine; and in Lafayette's ministry, a member of the council of state. In a few months, however, he resigned his office of prefect, and declined the post of ambassador at Constantinople, offered him by Louis Philippe. After Casimir Périer became minister, he lost also his place in the council of state. He now began his opposition career in the chamber of deputies against the reactionary policy of the government, and became the rallying-point for all who desired the carrying out of the principles of the July revolution. He essentially contributed to the removal of the doctrinaires (q.v.) from office, in Feb. 1836, and energetically opposed the ministry of Molé, even supporting the doctrinaires in accomplishing its overthrow, in Jan. 1839. The same year he visited England and Scotland. When, in Mar. 1840, Thiers was placed at the head of the government, B. for the first time declared himself in favor of the ministerial policy on the oriental question. On the return of Guizot to office in Oct. following, his opposition to the government was renewed. Taking a conspicuous part in the reform movement of 1847, he attended several of the provincial reform banquets, which led to the revolution of 1848. On the outbreak of the struggle of 23d Feb., when Louis Philippe called upon Thiers to form a new ministry, B. was appointed president. His advice to the king to withdraw his troops proved fatal to the throne of July. In the last sitting of the chamber of deputies, B. supported the claim of the count de Paris to the throne, and the regency of the duchess of Orleans. Under the presidency of Louis Napoleon he was for some time a minister, and conducted the government with success till 1851, when he retired from active political life. He, however, took part in the conference in favor of Poland, held at Paris in 1864. In 1872, he was made a councilor of state and vice-president of the council. In his retirement, he wrote a pamphlet, *De la Centralisation et de ses Effets* (1861), etc. He died in 1873.

BARROW, a distinctive term applied to two prominent localities of the Arctic ocean, in honor of the secretary to the admiralty of the same name, the prime mover in the more recent era of northern discovery.—1. *Point B.* in lat. 71° 23′ n., and long. 156° 31′ w., generally received as the most northerly spot on the American mainland; see, however, BELLOT STRAIT. From this circumstance, it has also been called *Cape North*—a designation inconveniently ambiguous, as tending to confound this headland at once with cape North in Asia, and North cape in Europe. 2. *Barrow Strait,* the earliest of Parry's discoveries, leading to the w. out of Lancaster sound, which Parry's immediate predecessor, captain, afterwards sir John Ross, had pronounced to be landlocked in that direction. Besides its main course, B. strait throws off *Prince Regent's Inlet* to the s., and *Wellington Channel* to the north. The passage averages about 40 m. in breadth, extending pretty nearly along the parallel of 74° n., from 84° to 90° west.

The interval between these two localities, thus spanning 66° of long. or at least 2000 m., only one navigator has ever traversed—the indefatigable M'Clure, carrying his good ship, the *Investigator,* round point B. and leaving her behind him only when almost in sight of B. strait.

BARROW, a river in the s.e. of Ireland. Of the Irish rivers, it is in importance next to the Shannon. It rises in the n. of Queen's co., on the n.e. slope of the Slieve Bloom ridge of mountains. It flows first e. past Portarlington to the border of Kildare co., and then s. between Queen's, Kilkenny, and Waterford counties on the w., and Kildare, Carlow, and Wexford counties on the e., passing the towns of Athy, Carlow, and New Ross. It has a course of 100 m. through a carboniferous, granitic, and silurian basin. Two m. above New Ross it receives the Nore (q.v.), and eight m. e. of Waterford, it is joined by the Suir (q.v.). These three rivers (called the Three Sisters, from their rising in the same mountain-ridge, and joining near the sea, after flowing through different counties) form, near the sea, the large and secure estuary of Waterford harbor, 9 m. long. The B. is navigable for ships of 300 tons to New Ross, 25 m. up, and for barges to Athy, 65 m. up, whence the grand canal communicates with Dublin. The B., below Portarlington, falls 227 feet.

BARROW, ISAAC, an eminent English mathematician and divine, was b. in 1630. He received his early education at the Charter-house, where he was distinguished chiefly by his negligence and pugnacity. At Felstead school, in Essex, to which he went next, he greatly improved; and in 1643, he was entered at Peter-house, Cambridge, under his uncle, Isaac Barrow, then a fellow of that college, and finally bishop of St. Asaph. On the ejection of his uncle in 1645, he removed to Trinity college, where he became B.A. in 1648, fellow in 1649, and M.A. in 1652. Finding that to be a good theologian he must know chronology, that chronology implies astronomy, and astronomy mathematics, he

applied himself to the latter science with distinguished success. To the classics he had already devoted much study, and on the vacancy of the Greek chair, he was recommended for the office; but a suspicion of Arminianism interfered with his success. After this disappointment, he went abroad (1655), and traveled during four years through France and Italy, to Smyrna and Constantinople, back to Venice, and home through Germany and Holland. On the voyage from Leghorn to Smyrna, his determined personal courage seems to have been instrumental in scaring away an Algerine pirate, after a brisk exchange of shots. Soon after his return he took orders, and in the following year was appointed professor of Greek. The neglect with which he was treated after the restoration is celebrated in his couplet addressed to the king—

Te magis optavit redditurum, Carole, nemo,
Et nemo sensit te redisse minus.

In 1662, he was appointed to the Gresham professorship of geometry, which, on his being appointed to the Lucasian professorship in 1663, he thought it his duty to resign. The latter also he resigned in 1669, in favor of his pupil Isaac Newton. On quitting his professorship, he obtained from his uncle a small living in Wales, and from Dr. Seth Ward, bishop of Salisbury, a prebend in that cathedral. He devoted the revenues of both to charitable purposes, and resigned them in 1672, on being appointed by the king master of Trinity college. To him, while in this office, is due the foundation of that valuable library, which is one of the chief ornaments of the university. In 1675, he was nominated vice-chancellor of the university; and in 1677, he d. at the early age of 47, having achieved, by his numerous able works, and the force of his noble personal character, a reputation which time has left unimpaired. Of his original mathematical works, the principal are his *Lectiones Geometricæ* and *Lectiones Opticæ*, of which it has been said that they are "a mine of curious interesting propositions, to which geometry is always applied with particular elegance." As a theologian, his fame rests chiefly on his sermons, which are very remarkable as specimens of clear, exhaustive, and vigorous discussion. His sermons, it may be added, were generally of excessive length. One, on charity, lasted three hours and a half; and at Westminster abbey, he once detained the audience so long that they got the organ to play "till they had blowed him down." B.'s English works, consisting of sermons, expositions, etc., have been edited by Dr. Tillotson, dean of Canterbury, and prefaced with a life by Mr. Hill. His works, besides those already mentioned, are very numerous, and include *Euclidis Elementa*, *Euclidis Data*, *Mathematicæ Lectiones*, *Opuscula*, containing Latin sermons, poems, speeches, etc. *Lectiones Mathematicæ* and *L. Geometricæ* have been translated by Kirby and Stone. *Euclidis Elementa* has also been translated.

BARROW, Sir JOHN, Baronet, an English traveler, was b. on the 19th June, 1764, at Drayleybeck, in Lancashire; was early instructed in mathematics; and after having published a small volume on land-surveying, filled a situation in a Liverpool iron-foundry, visited Greenland with a whaler, and after his return taught mathematics in an academy at Greenwich. He received an appointment as private secretary and keeper of accounts to lord Macartney, who went as ambassador to China. He availed himself of his residence in China to learn the Chinese language, and to collect valuable materials for the account of China, which he afterwards gave to the world, partly in articles in the *Quarterly Review*, and partly in his *Travels in China* (Lond., 1804). When lord Macartney afterwards became governor of Cape Colony, Barrow availed himself of his residence in s. Africa to make extensive excursions in the interior of the country, which he described in his still valuable *Travels in the Interior of Southern Africa* (2 vols., Lond., 1801–3). Having returned to London, in the year 1804, he was appointed by lord Melville secretary to the admiralty, which situation he continued to hold till 1845, except for a short time in 1806. Besides the works above mentioned, B. published *A Voyage to Cochin-China in the Years* 1792 *and* 1793 (Lond., 1806), *The Life of Macartney* (2 vols., Lond., 1807), *A Chronological History of Voyages into the Arctic Regions* (Lond., 1818); also a series of lives of English naval worthies. Under Peel's ministry in 1835, he was raised to the baronetcy. In the year 1845, he retired from public service, but afterwards published *An Autobiographical Memoir* (Lond., 1847), and *Sketches of the Royal Society*, and d. at London, 23d Nov., 1848. He rendered many services to geographical science by suggesting and promoting scientific expeditions; with him also originated the idea of the geographical society, founded in 1830, of which he was vice-president till his death.

BARROW-IN-FURNESS, a seaport and rapidly increasing t. of n. Lancashire, England, situated on the south-western coast of the peninsula of Furness, opposite to a small island called Barrow island, which is traditionally reported to have been in former times a burial-place of Norse rovers. It is 8 m. s.w. from Ulverston, and 18 m. w.n.w. from Lancaster. It is connected by railway with Dalton, from which it is not quite 4 m. distant, and so with the whole railway system of England. The growth of B. has of late years been so rapid as to be almost unparalleled in the history of the towns of England. In 1847, it was an insignificant fishing-village of about 300 inhabitants; in 1857, the population was more than 2000, a large proportion being sailors and fishers; in 1871, the population had increased to 18,245; and by 1875, it was above 40,000. This rapid increase is owing to the great quantity of iron ore, of the best

quality—red hematite—which exists in the neighborhood, and the establishment both of mines and smelting-works. A small qantity of iron ore from this neighborhood was, for many years, exported to be smelted elsewhere; but about the year 1859, smelting-works were established at B. by Messrs. Schneider, Hannay, & Co., which soon gave employment to a great number of men, and converted the old fishing-village into a prosperous town. In 1865, these works produced about 160,000 tons of iron. In 1866, the Barrow iron-works were taken over by the Barrow hematite steel company, which has now 12 blast-furnaces in constant operation, and 18 converters for making Bessemer steel. The company partly raise their own ore, employ at their works and mines nearly 5000 men, and utilize about 500,000 tons of ore annually. The amount of pig-iron made weekly is about 5500 tons, of which nearly 1000 tons are taken to the steel-works, and their converted by the Bessemer process into steel. Great quantities of limestone and coke are used in the iron-furnaces and steel-works. The red hematite of B. yields an average of 57 per cent of iron. The B. steel-works are the largest Bessemer steel-works in Britain, producing about 110,000 tons of steel annually. In the B. works, the iron is conveyed in a molten state from the blast-furnaces to the "converters," where it is made into steel. Some of the steam-hammers employed have heads of five tons weight, and some of six tons. Copper as well as iron ore is obtained in considerable quantity near B., and is exported to the amount of about 3000 tons annually. About 20,000 tons of slate are also annually quarried in the neighborhood, and sent by coasters or by rail to other parts of Great Britain.

The town of B. is built on a regular plan, mostly in rectangles. St. George's church is a handsome Gothic building, erected chiefly at the expense of the dukes of Devonshire and Buccleuch, the principal land-owners of the town and neighborhood. There are other places of worship belonging to the church of England and other denominations.

The Furness railway company have recently expended a large sum of money in converting the channel between the mainland and Barrow island into docks. The total cost is estimated at £200,000. There are three principal docks. The Ramsden dock, when completed, will give a water area of 200 acres. Barrow island has become a great seat of iron ship-building. A large jute-work employs 2000 hands. Other branches of industry have also begun to be attracted to Barrow. Its foreign trade is increasing; the imports include timber from Sweden and Canada, coal from Wales, and preserved provisions from New York. The chief exports are ore, steel rails—of which about 20,000 tons are shipped annually—and pig-iron. Steamers ply regularly between Belfast, Glasgow, and Douglas, Isle of Man. The interesting ruins of Furness abbey lie within 2 m. from the town; while on Piel island there are the ruins of a castle built by the abbot of Furness. From the excellence of the harbor, the abundant facilities of railway conveyance, and the mineral wealth of the district, it may confidently be expected that B. will still rapidly increase in importance.

BARROW-ON-SOAR, a village in the n. of Leicestershire, 10 m. n. of Leicester. It is noted for its blue lime or terras, which makes good cement under water. It has manufactures of lace and stockings. It has free schools and several charities; and is the seat of the poor-law union of the district, with a workhouse capable of accommodating 500 persons.

BARROWS, artificial mounds of earth generally believed to have been erected for sepulchral or monumental purposes. They are very numerous in Great Britain, and many of them are supposed to belong to a period long prior to the Roman invasion. The counties of Wilts and Dorset are especially rich in these remains, and the B. of the former have been thoroughly explored, described, and classified by sir R. C. Hoare in his *Ancient Wiltshire* (2 vols. fol. 1810–21). In the sepulchral B., the human remains are buried either in a rude stone "cist" or chest, in which the body was doubled up, or are laid at full length in the earth, accompanied by arms and other utensils. Where the body was burned, the remains were laid on the floor of the barrow, in a cist excavated on the spot, or at a later epoch, in a clay urn. Sir R. Hoare considers the Wiltshire B. as indicating three stages in the progress of society. The first class contains spear and arrow heads of flint and bone; the second of brass; and the third contains arms and instruments made of iron. One of the largest barrows in Europe is Silbury hill, near Marlborough, in Wiltshire, which covers 5 acres, 34 perches of land, and has a slope of 316 ft., with a perpendicular height of 170. According to sir R. Hoare, barrow-burial was practiced down to the 8th c., from a period of unknown antiquity. The practice of erecting sepulchral mounds prevailed among all the principal nations of antiquity both in Europe and Asia, and they are found in great numbers in Central America. Many barrows are only partly artificial; natural mounds having been shaped by human hands into the form, round or oblong, which it was wished they should take.

BARROWS, ELIJAH PORTER, S.T.D.; b. Conn., 1805; a graduate of Yale; pastor of the First Presbyterian church in New York, 1835; professor of sacred literature in Western Reserve college, 1837–52; professor of Hebrew language and literature in Andover theological seminary, and afterward in Oberlin theological seminary. He is the author of *Companion to the Bible, Sacred Geography and Antiquities*, and has published many essays in religious periodicals.

BARRUN'DIA, JOSÉ FRANCISCO, 1780–1854, a Guatemalan statesman, early opposed to Spain, and in 1813 sentenced to death for treason. He escaped, hid for six years in the mountains, headed a party of revolutionists, and continued conspicuous through the war for independence. He was president of Guatemala in 1829, and again in 1852. In 1854, he came to the United States as minister from Honduras, with the purpose of procuring the annexation of that territory to the American union, but died from apoplexy soon after his arrival.

BARRY, a co. in s.w. Michigan, traversed by a branch of the Michigan Central railroad; 576 sq.m.; pop. '74, 22,051; in '80, 25,320. The surface is undulating prairie and woodland, dotted with small lakes. Cereals and dairy produce are the staples. Co. seat, Hastings.

BARRY, a co. in s.w. Missouri, on the Arkansas border; drained by White river; 703 sq.m.; pop. '70, 10,373—53 colored; in '80, 14,434. It produces cereals and tobacco. Co. seat, Cassville.

BARRY, a small island, of about a mile long, in the Bristol channel, off the s. coast of Glamorganshire, 10 m. s.w. of Cardiff. It has the ruins of an ancient castle and of two chapels. On Nell's point, in the s. part of the island, is a fine well, to which great numbers of women resort on Holy Thursday, and having washed their eyes in the spring, each drops a pin into it.

BARRY (in Heraldry), the term applied to a shield which is divided transversely into four, six, or more equal parts, and consisting of two or more tinctures interchangeably disposed.

Barry-bendy is where the shield is divided into four, six, or more equal parts, by diagonal lines, the tincture of which it consists being varied interchangeably.

Barry-pily is where the shield is divided by diagonal lines, the colors being interchanged as in the example.

BARRY, COMTESSE DU. See DU BARRY.

BARRY CORNWALL. See PROCTER, BRYAN WALTER.

BARRY, Sir CHARLES, R.A., architect of the two houses of parliament, son of Walter Barry, esq., Westminster, was b. there in May, 1795. Educated at private schools in Leicestershire and Bedfordshire, he was indentured to Messrs. Middleton and Bailey, architects, Lambeth. In 1817, at the age of 22, he went to Italy. A wealthy countryman of his own, attracted by the beauty of his drawings, took him with him to Egypt as his companion, defraying his expenses. He also visited Greece and Rome. On his return to England after an absence of three and a half years, he became the successful competitor for the design of a church at Brighton. He was also the architect of the Manchester Athenæum, a building in the Grecian style, and of the grammar school of king Edward VI. at Birmingham; the latter esteemed the most beautiful of his works. In London, he designed the traveler's club and the reform club, both in Pall Mall, and the college of surgeons, Lincoln's Inn Fields. After the burning of the old houses of parliament in 1834, on a public competition, B.'s design for the new building was adjudged the best. The work was commenced in 1840, and on 3d Feb., 1852, her majesty opened the Victoria tower and royal gallery in state, and on the occasion knighted the architect. Chosen a royal academician in 1842, sir Charles was also a fellow of the royal society, of the society of arts, and of the institute of British architects. He died May 12, 1869.

BARRY, EDWARD MIDDLETON, b. 1830, an English architect, pupil of his father, whom he succeeded as architect of the houses of parliament. He is the architect of the new Covent Garden theater, the Charing Cross, and Star and Garter hotels, and of the new national gallery.

BARRY, JAMES, a historical painter, b. at Cork, Oct. 11, 1741, and distinguished more by the force of his conception than the excellence of his manipulation or the beauty of his color. Dr. Johnson's criticism on his works was: "Whatever the hand may have done, the mind has done its part. There is a grasp of mind there which you will find nowhere else." The *chef-d'œuvre* of B. is the "Victors at Olympia"—a work, the sight of which, Canova said, was of itself sufficient to repay a journey to England. B. was a protégé of Edmund Burke. He was of irritable temper, which led him into many quarrels, and the result of one with the royal academy was his expulsion from the academy. He died on the 22d Feb., 1806, in poor circumstances, while some friends were engaged in raising subscriptions to purchase him an annuity.

BARRY, JOHN, 1745–1803; b. Ireland; came to America about 1760; one of the earliest American naval officers. In 1776, in command of the *Lexington*, 14 guns, he captured the tender *Edward*, the first ship ever taken by a commissioned officer of the U. S. navy. In 1781, while returning from France in the *Alliance*, he captured two vessels, being severely wounded in the conflict. He was the first senior officer with the rank of commodore on the establishment of the present navy.

BARRY, MARTIN, a physiologist of eminence, was b. at Fratton, Hampshire, in 1802. He studied at the medical schools of London, and also at the university of Edinburgh, where he took his degree of M.D. in 1833. He wrote much on physiological subjects,

and especially on animal development and embryology, for discoveries in which he is best known. Until the publication of his papers in the *Philosophical Transactions* of the royal society of London in 1840–43, it was not known that spermatozoa actually penetrate *within* the ovum, and physiologists are also indebted to him for the knowledge of the segmentation of the yelk in mammals. In his private capacity, B. was amiable and greatly benevolent. His means being ample, he gave his professional services largely to the poor, and he acted as house-surgeon to the Edinburgh royal maternity hospital. He died at Beccles, in Suffolk, in April, 1855.

BARRY, WILLIAM FARQUHAR, b. New York, 1818; col. of artillery and brevet brig.gen. of the U. S. army; was in the Florida Indian war, and aid to gen. Worth in the Mexican war. In the rebellion he was chief of artillery of the army of the Potomac, and participated in a number of battles and in the siege of Yorktown. In 1867, he was made commander of the artillery school at Fortress Monroe, where he remains.

BARS, a province in n.w. Hungary around the head streams of the Danube. It is mountainous, but rich in gold, silver, and other minerals. The mines of Skleno and Vihnye are the most remarkable. The chief towns are Kremnitz and Nuesohl. Pop. '69, 137,191, mainly Roman Catholics.

BARSCH, or BARS, a fortified town of Hungary, capital of the county of the same name. It is situated on the Gran, which divides it into old and new Barsch. It is a mart of some importance for grain and fruit. Pop. '69, 910.

BARSU'MA, or BARSUMAS I., a Nestorian bishop of the 5th c., who induced the king of Persia to expel the Christians who followed the Greek fathers and to put Nestorians in their place. He founded the school at Nisibis, which sent missionaries to various countries. He married a nun, and maintained the right of all priests to marry. In Persia the Nestorians venerate him as the founder of their faith.

BAR-SUR-AUBE, a t. of France, in the department of Aube, situated on the right bank of the river of that name. It is an ill-built ancient town; numerous old coins and urns attesting that the Romans must have had a station here. B. was destroyed by the Huns in the 5th c., but rebuilt again soon after, when it became a place of commercial importance. A chapel built on the bridge which here crosses the Aube, now marks the spot from which the bastard of Bourbon was hurled into the river by command of Charles VII. in 1440. B. is also noteworthy as the place where the council of the allied sovereigns, which decided the plan of the campaign ending in the first fall of the empire, was held on Feb. 25, 1814; and where, two days after, the French were defeated by the allies, under the chief command of Schwarzenberg. B. has a pop. of (1876) 4495; a good trade in wine, wood, hemp, corn, and wool. Its principal industrial products are calicoes, table-covers, brandy, paper, vinegar, and nails.

BAR-SUR-SEINE, an ancient t. of France, in the department of Aube, pleasantly situated on the left bank of the Seine. It has a trade in grain, brandy, wool, and wine. Pop. '76, 2572. It is celebrated as the place where the allies, under the prince of Würtemberg, defeated the French under Macdonald, in Mar., 1814.

BARTAN', a t. of Anatolia, situated near the mouth of the Chati-su (ancient *Parthenius*) on the Black sea. Pop. 10,000, who carry on a brisk trade with Constantinople.

BARTAS, GUILLAUME DE SALLUSTE, a soldier, diplomatist, and man of letters, was b. at Montfort, in Armagnac, about the year 1544. His reputation was great during his life-time, alike in "the court, the camp, the grove." His chief poem is *The Divine Weeks and Works*, which gives an account of the creation, and the history of the Jews as far as the book of Chronicles, and is said to have had a considerable influence on Milton's *Paradise Lost*. Thirty editions of the work passed through the press in six years. Dryden, when a boy, thought his verse incomparably superior to Spenser's; an opinion, however, which he lived to be ashamed of having ever entertained. B.'s name is now quite forgotten, or remembered only in connection with bad taste. It is not to be denied, however, that his fancy, though generally grotesque and lawless, occasionally strikes out most picturesque imagery and epithets. His use of compound words first led to their introduction into England, through his translator Sylvester (q.v.), and to the consequent enrichment of our poetry. He died of wounds received at the battle of Ivry, 1590.

BARTER, in commerce and political economy, a term used to express the exchange of one commodity for another, as contrasted with the sale of commodities for money. It is usual to suppose that in the history of any community B. preceded the other methods of commerce, as people would find the convenience of exchanging one article for another before they were acquainted with money or credit. In point of fact, ships visiting savage countries are generally to some extent freighted with weapons, tools, or ornaments, to be used in B., if it be desirable to carry on a trade with the inhabitants. Under old artificial systems of political economy, there was much useless discussion about the question whether a B. trade or a money-payment trade was more advantageous to the community at large, and which of them should be encouraged while the other is depressed. On the one side, it was maintained that nothing but an export sale for cash was really profitable; on the other, that it was more advantageous to get goods in return,

because thus there was a double transaction and double profit. See BALANCE OF TRADE. But the simple doctrine of the present day, that whatever the merchant finds most profitable to himself will also be most profitable to the community, saves the necessity of making these distinctions, and of acting upon them by interference with commerce. B. is, in reality, one of the commonest forms of trade, taken at large in the present day. The exporter sends goods to his agent, who, without probably ever touching hard cash in the course of the transaction, lays in a cargo of import goods with the value, and these are literally brought home in exchange for those sent out.

In law, BARTER, or EXCHANGE, as it is now more generally called in law-books, is a contract for transferring property, the consideration being some other commodity; or it may be described as a contract for the exchange of two subjects or commodities. It this differs from *sale*, which is a contract for the transference of property in consideration of a price in *money*. See EXCHANGE; SALE OF GOODS.

BARTFA, or BART'FELD, a small but very old free t. of n. Hungary, in the province of Saros, on the Tepla, 155 m. n.e. of Pesth. Its position on the borders of Galicia has frequently made it a place of refuge for Poles and Russians. Its hot baths are much frequented, and a trade in wine, brandy, linen, and earthenware is carried on. Pop. '69, 5303.

BARTH, or BARDT, a t. in Pomerania, on the river B., 17 m. w. of Stralsund; pop. '71, 5774. It was once the residence of the dukes of Pomerania, and from 1630 to 1815 belonged to Sweden.

BARTH, CHRISTIAN GOTTLOB, 1799–1862; a German philanthropist and pastor, especially devoted to missionary work. He founded a school for the training of poor children. His Bible history and Bible stories have had an immense circulation.

BARTH, HEINRICH, PH.D., D.C.L., an enterprising modern African traveler. b. at Hamburg, 19th May, 1821, received his education in his native town, and afterwards went to the university of Berlin. In his youth his favorite studies were the Roman and Greek classics and antiquities, along with the geographical sciences. Hence he imbibed a strong desire to explore the shores and countries of the Mediterranean. After visiting Italy and Sicily, he embarked, in 1845, at Marseilles, and from Gibraltar passed over to Tangier in Africa. Proceeding along the Algerian coast he made excursions into the interior, to Tunis, Tripoli, and Bangazi. On his journey thence to Cairo, he was attacked by a band of Arab robbers, whom he bravely resisted, but was severely wounded, and lost all his effects and papers. He afterwards extended his researches into Egypt, Sinai, Palestine, Asia Minor, and Greece. These travels occupied him for nearly three years, and in 1849 he published, at Berlin, an account of a portion of them in a work entitled *Wanderungen durch die Küstenländer des Mittelmeeres*. On the 8th December of that year he again sailed from Marseilles, having been (along with Dr. Overweg) appointed by the British government scientific companion to Mr. James Richardson, then charged by the foreign office with a political and commercial mission to central Africa. Starting from Tripoli on the 4th Feb., 1850, Dr. B. and his companions crossed the great desert amid much difficulty and danger. B. soon separated from his friends, and pursued his researches for the most part by himself. Both Mr. Richardson and Dr. Overweg succumbed to the climate, and thenceforward B. was quite alone. He did not, however, return disheartened, but continued his explorations, which, when he returned to Tripoli in Sept., 1855, had extended over 24° of lat. and 20° of long., from Tripoli in the n. to Andamawa in the s., and from Bagirmi in the e. to Timbuctoo in the w., upwards of 12,000 miles. The result of his researches was given to the world in his *Travels and Discoveries in Central Africa*, 5 vols. (Lond., 1857–1858). Afterwards, he made several journeys in Greece, Turkey, Asia Minor, and other countries on the Mediterranean. Shortly after returning from one of these, he d. at Dresden, Nov. 25, 1865. In 1858, appeared his *Reise von Trapezunt durch die nördl. Hälfte Kleinasiens nach Skutari;* in 1862, his *Sammlung und Bearbeitung central-afrik. Vocabularien.*

BARTH, JEAN, or BART, a French naval hero, the son of a fisherman, b. in 1651 at Dunkirk, but, according to others, in the Netherlands. At an early age he entered the Dutch navy, but on the commencement of the war with Holland he passed over to the French service. As persons not of noble birth could not then obtain the rank of officer in the navy, he became captain of a privateer. In this capacity he displayed astonishing bravery, so that Louis XIV. dispatched him on a special mission to the Mediterranean. His exploits at last induced the king to appoint him lieutenant of a man-of-war. In an action against a superior English force he was taken prisoner, and carried to Plymouth, from which he made his escape in an open fishing-boat to France, where the king now raised him to the rank of captain. In the year 1696, Louis XIV. received him with distinction at Versailles, but at the same time spoke continually of the mischance which had befallen him the year before. Stung by this, B. hastened to Dunkirk, and in spite of the blockade of the harbor by the English, undertook a cruise, in which he was remarkably successful. Louis XIV., in a personal audience in 1697, appointed him to the command of a squadron, upon which B. exclaimed: "Sire, you have done well in this." The courtiers laughed, as at a piece of gross rudeness; but the king took the answer in good part, and B. very soon showed how well he merited such an appointment. The

peace of Ryswick terminated his active career. He died at Dunkirk in 1702. His rough frankness and coarse wit, in which he spared neither high nor low, made him popular, no less than his boldness and readiness for battle. When the prince de Conti was nominated king of Poland, B. was required, by command of Louis XIV., to convey him to Elsinore, and the ship being attacked by the English on the voyage, was near being taken. After the action, the prince expressed to him his great delight that they had escaped from the enemy. "We had no need," was the reply, "to be afraid of being made prisoners; I had dispatched my son with a match to the powder-magazine, to blow up the ship on the first wink!"

BARTHÉLEMY, AUGUSTE-MARSEILLE, a French poet and politician of some eminence, was b. at Marseilles in 1796. Whilst still very young, he was sent to the college of Juilly; and he had scarcely completed his studies when he began to acquire reputation in his native town as a poet of distinct promise. He was naturally attracted to Paris, where, at first, his verses, published without his name, did not attract much attention. Gradually, however, he became known; and in 1825, in conjunction with his fellow-townsman, M. Méry, he issued a collection of satirical epistles, under the title *Les Sidiennes;* and the year after, a mock-heroic poem, *La Villéliade, ou la Prise du Château de Rivoli.* This vigorous political squib had a great success: in the course of the year, it ran through fifteen editions, and is said to have put into the pocket of the young authors some 24,000 francs. Continuing to work together in opposition to the government of Charles X., and in the interest of Napoleonic ideas, they put forth upwards of 20 pieces of a like satirical cast before 1830. The revolution of July of that year found B. in prison, for an offense done to the government in one of his later publications. His liberation, of course, was immediate; and along with his friend Méry, he celebrated the victory of the people in a poem dedicated to the Parisians, and entitled *L'Insurrection,* which is characterized by the great critic, M. de Sainte-Beuve, as one of the happiest productions of the writers. A pension of 1200 francs, bestowed on him by Louis Philippe, did not deter B. from attacking his ministers with the same asperity he had exercised towards those of the dethroned monarch; and in consequence, it was within a year or two withdrawn. During all the changes which followed, B. was indefatigable as a versifier on the political events of the day; but, except for readers intimately versed in the detail of these, the mere list of his numerous productions could have only the very faintest significance. The force and brilliancy of his satire is on all hands admitted; and though, in his later years, his popularity somewhat declined, his writings throughout exercised considerable influence in determining opinion among the lively population of Paris. He was, from the first, a warm supporter of the second Napoleonic *régime.* His death took place Aug., 1867, at Marseilles, of which city he was librarian.

BARTHÉLEMY, JEAN JACQUES, a historian and antiquary, b. 20th Jan., 1716, at Cassis, near Aubagne, in Provence. He was educated under the Jesuits for the church, but soon abandoned all thought of becoming a priest, and devoted himself to the study of the Greek, Hebrew, Syriac, Arabic, and Chaldee languages, though he retained the dress and title of an abbé. He first acquired distinction by the discovery of the Palmyran alphabet. In 1745, he was appointed assistant-superintendent of the royal cabinet of medals, and in 1747 elected a member of the *Académie des Inscriptions et Belles-lettres.* To complete his studies, he visited Rome in 1754, in the suite of M. de Stainville, afterwards duke of Choiseul, and then French ambassador, where he was courteously received by pope Benedict XIV. After his return, he was again employed in the arrangement of the royal cabinet of medals, which he augmented by a great number of costly specimens. The duc de Choiseul, who became minister in 1758, placed him, by means of a pension and other favors, in a position to devote himself entirely to learned researches, which he quietly pursued till the revolution of 1789 deprived him of his offices. In Sept., 1793, he was imprisoned on charge of being an aristocrat, but almost immediately released. Shortly after, he was offered the situation of national librarian, then vacant, but his age and infirmities compelled him to decline it. He d. April 30, 1795.

His most celebrated and popular work is the *Voyage du jeune Anacharsis en Grèce dans le Milieu du quatrième Siècle avant l'ère Chrétienne,* Paris, 1788, 4 vols. (Travels of the Young Anacharsis in Greece about the Middle of the Fourth Century B.C.). The work (see ANACHARSIS) is a very pleasing and agreeable performance; exhibits an extensive knowledge of the ancient world, especially of Greece and its colonies; and abounds in observations which, if not profound, are at least judicious. Later and more severe criticism has, however, pointed out many deficiencies and anachronisms. It has been translated into almost every European language. Among Barthélemy's other works may be mentioned a romance, entitled *Caryte et Polydore* (Paris, 1760); *Explication de la Mosaïque de Palestrine* (Paris, 1760); *Réflexions sur l'Alphabet et la Langue de Palmyre* (Paris, 1754).

BARTHÉLEMY SAINT-HILAIRE, JULES, a learned Frenchman, member of the institute, and a representative of the people, was b. at Paris on the 19th of Aug., 1805. He first held a subordinate office under the minister of finance. During 1828–30, he was one of the editors of the *Globe,* a Paris paper. After the July revolution, he took part with the society *Aide-toi et le Ciel t'aidera* (q.v.), revised several of its democratic mani-

festoes, established the *Bon Sens*, and continued to attack the government of Louis Philippe in the *Constitutionnel*, the *Courrier-Français*, and the *National*. In 1833, he desisted from political strife, and betook himself to more quiet studies. In 1834, he was named *Repetiteur* for the French literature class in the *Ecole Polytechnique;* and in 1838, professor of Greek and Latin philosophy in the *collége de France*. The revolution of February, however, brought him once more into the political arena. He was appointed secretary to the provisional government, but refused his support to the government of Cavaignac, and even appeared as his accuser, though he failed to establish his charges against the suppressor of the June insurrection. B. was at first in favor of Louis Napoleon, but the *coup d'état* on the 2d of Dec., and the overthrow of the constitution, compelled him to become an oppositionist. He then retired for a time from public life, and resigned his chair, but in 1862 he was reappointed. In 1869, he was returned to the corps législatif by the first circumscription of Seine-et-Oise; and, in 1871, to the assembly for the department of Seine-et-Oise. In 1875, he was elected by the assembly one of the 75 life-members of the new senate.

His principal writings are his translations of Aristotle's works—*Politique d'Aristote* (Paris, 1837); *De la Logique d'Aristote* (1838); *La Logique d'Aristote*, translated into French for the first time (1839–44, 4 vols.); *Psychologie d'Aristote, Traité de l'âme* (1846); *De l'Ecole d'Alexandrie* (1845); *Rapport sur la Comparaison de la Philosophie Morale et Politique de Platon et d'Aristote, avec les Doctrines des plus grands Philosophes Modernes* (1854); *Des Védas* (1854); *Du Bouddhisme* (1855). An enlarged edition of this last, with an account of Buddhism in Ceylon at present, was published in 1860.

BARTHEZ, Paul Joseph, one of the most learned physicians of France, son of a distinguished engineer, b. in Montpellier, 11th Dec., 1734. After serving as an army physician, he founded at Montpellier a medical school, which rose to a high European reputation. His *Nouveaux Elements de la Science de l'Homme* (Montpell. 1778; 2d ed., 2 vols., Par. 1806), in which he set forth a system founded on dynamical principles, was translated into most of the languages of Europe. He became, in 1785, titular chancellor of the university of Montpellier; and consultations with him on serious cases were sought from all parts of the civilized world. The revolution deprived him of the greater part of his property and his places, and compelled him to leave Paris; but Napoleon recalled him, and heaped honors and dignities upon him in his old age. He died in great suffering, after an operation for stone in the bladder, on 15th Oct., 1806. Of his numerous writings, the following deserve special mention: *Nouvelle Mécanique des Mouvements de l'Homme et des Animaux* (Carcassonne, 1798); *Traitement des Maladies Gouteuses* (2 vols., Par. 1802; new ed., 1819;) and *Consultation de Médecine* (2 vols., Par. 1810.—See Lordat, *Exposition de la Doctrine Médicale de Barthez, et Mémoires sur la Vie de ce Médecin* (1818).

BARTHOLIN, the name of a Danish family distinguished for learning and authorship, and the members of which have filled many important offices, especially in the university of Copenhagen. Kasper B., b. 12th Feb., 1585, at Malmö, where his father was a minister, studied theology and philosophy at Rostock and Wittenberg, and afterwards studied medicine. In the year 1610, he was made doctor of medicine at Basle. He practiced for some time in Wittenberg, and in 1613 accepted an invitation to be professor of the Greek language and of medicine at Copenhagen, where, in 1624, he became professor of theology. He died at Sora in 1629. His *Institutiones Anatomicæ* (Wittenb., 1611, and often reprinted), which were translated into the German, French, English, and oriental languages, served in the 17th c., in many universities, as a text-book for prelections. Of his sons, who are all known in the learned world, the following especially deserve to be mentioned: the orientalist, Jacob B., b. 1623, d. at Heidelberg, 1653, known as the editor of the cabalistic works, *Bahir* and *Majan Hachochma;* and Thomas B., equally celebrated as a philologist, naturalist, and physician, who was b. 20th Oct., 1616. He became, in 1647, professor of mathematics, and in 1648 professor of anatomy, at Copenhagen; demitted these offices in 1661, and thereafter lived in retirement upon his estate of Hagestad. In 1670, the king appointed him his physician in ordinary, which situation he filled till his death, 4th Nov., 1680. He enlarged the new edition of his father's anatomy (Leyd., 1641; often reprinted) with a mass of new observations. Besides many other valuable anatomical and medical works, his works on biblical and other antiquities, and on natural philosophy, are particularly worthy of notice. He was one of the most learned and studious of physicians, and warmly defended Harvey's doctrine of the circulation of the blood. His son, Kasper B., b. 1654, d. 1704, was likewise an accomplished anatomist; and another son, Thomas B., b. 1659, d. 1690, is the author of a standard work on northern antiquities—the *Antiquitatum Danicarum Libri Tres* (Copenh., 1689); also of *De Causis Contemptæ a Danis adhuc gentilibus Mortis.*

BARTHOLOMEW, a co. in s.e. Indiana, intersected by the Jeffersonville, Madison, and Indianapolis railroad; 375 sq.m.; pop. '79, 21,133; level in the e. and hilly in the w.; produces cereals, butter, and wool. Co. seat, Columbus.

BARTHOLOMEW, Saint, one of the twelve apostles, supposed to be the same person as Nathaniel. He was a native of Galilee, but nothing authentic is known regarding his life and labors. According to the traditionary record of Eusebius, he carried Christianity

into India; Chrysostom speaks of him as a missionary in Armenia and Asia Minor, while a still later legend declares that he was crucified at Albania Pyla, the modern Derbend, a town on the Caspian sea. The relics of St. B. "appeared" at Rome in 983 A.D., and are preserved there in the church bearing his name. The Roman and Anglo-Catholic churches hold a festival in his memory on the 24th Aug.; the Greek church, on the 11th June. The primitive church possessed an apocryphal gospel under his name, but it is now lost.

BARTHOLOMEW, ST., a Caribbean island, bought by Sweden in 1785 from the French West India company, and acquired again by France through purchase in 1878. It lies about 30 m. to the n. of St. Kitts, in about 17° 40′ n. lat. and 63° e. long. With an area of only 35 sq.m., St. B. contains about 2900 inhabitants. The soil is fertile, though, as is generally the case in the group, fresh water is scarce. Like most of its neighbors, St. B. is difficult of access, its only harbor (Le Carenage) being on its w. side, near the chief town, Gustavia.

BARTHOLOMEW, EDWARD SHEFFIELD, 1822–58; b. Conn. He was first a dentist, then a painter, and lastly a sculptor. Among his productions are "Youth and Age," "The Shepherd Boy," "Ganymede and the Eagle," "Eve after the Fall," and a monument to Charles Carroll.

BARTHOLOMEW BAYOU, a channel or outlet beginning in Arkansas and running in a very crooked course to Washita river in Louisiana; navigable 200 m. for steamboats.

BARTHOLOMEW FAIR, formerly held at West Smithfield, London, but discontinued since 1855. The charter of this fair was granted by Henry I., in 1133, to a monk named Rayer or Rahere, who had been his jester, and had founded the church and priory of St. Bartholomew, with an hospital attached. The fair was held annually at the festival of St. Bartholomew (Aug. 24, old style), and, like all ancient fairs, was originally connected with the church, under whose auspices miracle-plays (q.v.), founded on the legends of saints, were represented, which gave place to mysteries, and these again to moralities; afterwards, profane stories were introduced—the origin of the modern English drama. After the opening of the fair, it was customary anciently for wrestlers to exercise their art. Wild rabbits were hunted for sport by the mob, and the scholars from the different London schools met at the priory for disputations on grammar and logic, and to wrangle together in verse. In the first centuries of its existence, B. F. was one of the great annual markets of the nation, and the chief cloth-fair of the kingdom. The clothiers of England and the drapers of London had their standings, during the fair, in the priory church-yard. A peddler's court, or court of *pie poudre* (see PIEPOWDER COURT), was held within the priory gates, for debts and contracts, before a jury of traders formed on the spot, at which the prior, as lord of the fair, presided by his representative or steward. In 1445, four persons were appointed by the court of aldermen as keepers of the fair and of the court of *pie poudre*, the city being thus in that court represented as joint lord of the fair with the prior. As the fair prospered, its chief articles of traffic were, in the first instance, cloth stuffs, leather, pewter, and live cattle; while it was rendered attractive to the crowds that attended it by a variety of popular amusements. All manner of shows, exhibitions, theatrical booths, etc., thronged the fair; and tumblers, acrobats, stilt-walkers, mummers, mountebanks, and merry-andrews resorted to it in great numbers. On the suppression of the religious houses, the priory was disjoined from the hospital, and the latter, on 27th Dec., 1546, was, by Henry VIII., transferred to the corporation of London, a new hospital being established on the site of the former. The priory was purchased for £1064, 11*s.* 3*d.* by Sir Richard Rich, chancellor of the court of augmentations, afterwards lord chancellor under the title of lord Rich, and became his town-house. Towards the close of the 16th c., streets of houses began to be built on the site of the cloth-fair, a name which is still retained. In 1593, the keeping of the fair was, for the first time, suspended by the raging of the plague. The same thing happened in 1603, in 1625, in 1630, in 1665, and in 1666. At this fair, foreigners were at first licensed for three days, and the city freemen as long as they would, which was six or seven days. In 1661, after the restoration, the fair lasted for 14 days or more. In 1685, it was leased by the city to the sword-bearer. After this period, it began to decay as a place of trade. In 1691, the continuance of the fair was limited to three days, besides the proclamation day. In 1701, it was represented as a nuisance. In 1750, it was again limited to three days. By the alteration of the calendar in 1752, the fair, in the following year, was, for the first time, proclaimed on 3d September. In 1798, the question of abolishing the fair was discussed by the corporation. It had long ceased to be a place of traffic, and was only considered as a haunt of amusement, riot, and dissipation. The fair had latterly been attended only by the keepers of a few gingerbread-stalls; and in 1839, measures were first seriously adopted for its suppression. In 1840, the exhibitions were removed to Islington. Wild-beast shows were allowed, but dwarfs and giants were excluded. In 1850, the last proclamation by the lord mayor took place, and in 1855, the once famous B. F. came to an end. An octavo volume, entitled *Memoirs of Bartholomew Fair,* by Henry Morley, was published in London in 1859.

BARTHOLOMEW'S (ST.) **DAY** (Fr. *La St.-Barthélemy;* Ger. *Bartholomäusnacht*, i.e., Bartholomew's night, or *Bluthochzeit*, i.e., blood-wedding), the appellation given to the massacre of the Protestants in Paris on the night of St. B. D., between 24th and 25th Aug., 1572. After the death of Francis II. in 1560, Catharine de' Medici (q.v.), as regent for her son, Charles IX., a minor, in order to annoy the Catholic party of the duke Francis of Guise (q.v.), had granted an edict of toleration to the Reformed, at whose head was the prince of Condé. Both parties took up arms, and there ensued a war which lasted for eight years, the cruelties of which, through mutual exasperation, are almost incredible. The duke Francis of Guise was murdered by an assassin, and the prince of Condé was taken prisoner in the battle of Jarnac, in 1569, and shot. The young prince Henry of Bearn, afterwards king Henry IV., a nephew of Condé, then became leader of the Reformed, along with admiral Coligny (q.v.). It was not till the strength of both sides was exhausted, that the peace of St. Germain-en-Laye was concluded in 1570, whereby the Reformed obtained the free exercise of their religion. Catharine de' Medici now expressed much friendliness towards the Reformed, and even endeavored to lull them into negligence by the marriage of the youthful Henry of Bearn with her daughter Margaret, 18th Aug., 1572. Admiral Coligny was drawn to Paris, and the king not only made him costly presents, but gave him an important office in the council of state. However, all this was only the basest hypocrisy. When, by means of the marriage of prince Henry, the most eminent of the Reformed had been allured to Paris, admiral Coligny was wounded by a shot from a window of the palace on 22d Aug., 1572. The king, indeed, hastened to him, and swore to avenge him; but, on the very same day, the king was persuaded by his mother that the admiral sought his life. "By God's death!" he exclaimed, "let the admiral be slain, and not him only, but all the Huguenots, till not one remain that can give us trouble!" That night, Catharine held a council, and appointed St. B. D. for carrying into effect the long-contemplated massacre. After Coligny had been murdered, a bell in the tower of the royal palace, at the hour of midnight, gave the signal to the assembled companies of citizens for a general massacre of the Huguenots. The king himself fired from his palace upon those that were fleeing past. The prince of Condé and the king of Navarre only saved their lives by going to mass, and appearing to conform to the Catholic church. The provinces were at the same time summoned to similar slaughter; and although in some of them the officials were ashamed to publish the murderous commands which had been transmitted to them, there were found bloodthirsty fanatics enough, who perpetrated the greatest horrors for several weeks together in almost all the provinces, so that it was reckoned that 30,000 (some authorities make the number 70,000) persons were murdered. The pope celebrated the events of St. B. D. by a procession to the church of St. Louis, a grand *Te Deum*, and the proclamation of a year of jubilee. Many of the Huguenots fled to pathless mountains and to La Rochelle, to which the duke of Anjou laid siege. Upon receiving intelligence, however, that he had been elected king of Poland, he made an arrangement on July 6, 1573, according to which the king granted to the Huguenots an amnesty, and the exercise of their religion in certain towns.

BARTHOLOMEW'S (ST.) **HOSPITAL**, Smithfield, London, was originally a part of the priory of St. Bartholomew, founded in 1102 by Rahere, the first prior. At the dissolution of the religious houses, it was founded anew by Henry VIII., and the endowment has been subsequently enlarged from various sources, public and private. The hospital contains more than 600 beds, and affords relief to 70,000 patients annually. There is a medical school attached. The revenues are large and ample.

BARTIZAN, a small stone closet, thrown out upon corbels over doorways, and on other parts of mediæval castles, generally for defense, but sometimes only for convenience to the inmates and defenders.

BARTLETT, ELISHA, 1805–55; b. R. I.; a physician, graduated at the medial department of Brown university; lecturer on pathological anatomy; professor in Transylvania (Ky.) college, and in the universities of Maryland and New York, and professor of materia medica, etc., in the New York college of physicians and surgeons. He wrote *Essay on the Philosophy of Medical Science*, *Fevers of the United States*, and a volume of verses from subjects in Dickens' novels. He was also editor of the *Monthly Journal of Medical Literature*.

BARTLETT, ICHABOD, 1786–1853; b. N. H.; a lawyer of Portsmouth, N. H., educated at Dartmouth; was in the state legislature and in congress. He was a conspicuous forensic opponent of Daniel Webster and Jeremiah Mason.

BARTLETT, JOSEPH, 1762–1827; b. Mass.; a lawyer of Massachusetts, graduate of Harvard; author of *The New Vicar of Bray*, and other satirical verses. His life was remarkable. He visited England, fell to gambling, was put in prison, wrote a play to secure his release, and went upon the stage. He came back with a great quantity of goods procured on credit, and was wrecked on cape Cod. Then he went into law business and politics, and was elected to the legislature.

BARTLETT, JOSIAH, 1729–95; b. Mass.; a self-educated physician, beginning practice in New Hampshire, where he successfully introduced the use of Peruvian bark. He was in the legislature from 1765 until the revolution. He was a member of the

committee of safety, a justice of the peace, colonel of a regiment, delegate in congress, the first member to vote for the declaration of independence, and the first (after John Hancock, the president) to sign that document. He was judge of the common pleas, justice of the supreme court, and chief justice. He was a member of the state convention called to adopt the federal constitution, and the first governor of New Hampshire under its first constitution. He was president of the New Hampshire medical society, and always the friend and patron of learned men.

BARTLETT, SAMUEL COLCORD, D.D., LL.D.; b. N. H., 1817; graduate of Dartmouth, and of Andover theological seminary; professor of intellectual and moral philosophy in Western Reserve college, and of Biblical literature in Chicago theological seminary; Congregational pastor in various places; at present (1880) president of Dartmouth college. He is known as a vigorous writer in support of the old forms of doctrine. He has traveled in the east, and has published, besides many essays, *Sketches of the Missions of the American Board*, *Life and Death Eternal*, and special articles for Smith's *Dictionary of the Bible*.

BARTLETT, WILLIAM, 1748–1841; b. Mass.; a philanthropist who accumulated a large fortune in trade. He contributed $30,000 toward the founding of Andover theological seminary, and distributed more than a quarter of a million to mission and other benevolent objects.

BARTLETT, WILLIAM FRANCIS, b. Mass., 1840; graduated at Harvard; served with conspicuous honor in the civil war from private to brevet maj.gen. of volunteers; lost a leg at the siege of Yorktown; was wounded at Port Hudson, and the battle of the Wilderness, and once more while leading an assaulting column near Petersburg, when he was taken prisoner. He died, greatly lamented, Dec., 1876.

BARTLETT, WILLIAM HENRY, an artist and popular writer, was born at Kentish Town, London, on the 29th Mar., 1809. He was a pupil of the eminent architectural antiquary, Mr. John Britton, of London, and during his apprenticeship displayed more than ordinary talent for drawing, which was fostered by his master sending him into many of the most interesting counties in England to make sketches from nature. Mr. Britton afterwards employed him to make drawings for his *Cathedral Antiquities* and also for his *Picturesque Antiquities of English Cities*. Subsequently B. visited the continent, the Holy Land, and America several times, on each occasion enriching his portfolio with innumerable interesting scenes. No fewer than 19 quarto volumes, containing about 1000 engravings from his sketches and letterpress from his own pen and those of his fellow-travelers, Dr. W. Beattie, N. P. Willis and Miss Pardoe, were devoted to these countries. Several other volumes, of which he was the sole author as well as artist, have also been published. Some of the books had a wonderful success, especially those on Swizerland, the Holy Land, and Egypt. B. died on the voyage from Malta to Marseilles on Sept. 25, 1854. He had been revisiting Palestine, and the materials he had collected were published under the title *Jerusalem Revisited*.

BARTLETT is also the name of several American authors, the most eminent of whom is John Russell B., born at Providence, R. I. (U. S.), in Oct., 1805. He was employed by the United States government, in 1850–53, as a commissioner for determining the Mexican boundary line, and, in 1854, published an account of his explorations and adventures, etc., in that capacity. In 1855, he became secretary of state of Rhode Island. He is also the author of *The Progress of Ethnology*, a popular *Dictionary of Americanisms*, *Bibliography of Books Relating to the Civil War*, etc.

BARTOL, CYRUS AUGUSTUS, D.D., b. Me., 1813; graduate of Bowdoin college, and of Cambridge divinity school, and became a Unitarian preacher, pastor of the West church, in Boston. In doctrine he ranks among the radicals of his denomination; in style he is clear and picturesque. He has published *Discourses on the Christian Spirit and Life*, *Christian Body and Form*, *Pictures of Europe*, *Radical Problems*, *The Rising Faith*, and many essays.

BARTOLI, DANIELE, 1608–85; a native of Ferrara, educated a Jesuit, and commissioned to write a history of the order, which he did in an elaborate work, treating especially of Christianity in Japan, and other parts of the east. He also wrote a history of the English Roman Catholics, the life of Loyola, several other biographies, books on religion and morals, on physical phenomena, grammar, etc.

BARTOLI'NI, LORENZO, a celebrated Italian sculptor, was b. at Vernio, in the n. of Tuscany, in 1777. Circumstances brought him to Paris while still a young man, where he practiced his art for some time with very little pecuniary success; but at length, having obtained an academy prize for a bass-relief of Cleobis and Biton, he was suddenly ushered into notice and prosperity. Several influential persons patronized him, such as Denon and Regnauld de St. Jean d'Angely. Through the first, he obtained a commission to execute one of the bass-reliefs in the hall of the Vendôme palace, and also the bust of Napoleon over the door of the institute of France. Napoleon himself gave him a multitude of orders, many of which, unfortunately, were never executed. In 1808, the emperor sent him to Carrara, to establish a school of sculpture. Here he remained till 1814, when he accompanied his imperial master to Elba. After the battle of Waterloo, he repaired to Florence, where he was subsequently appointed director of the

sculpture department in the academy of the fine arts, an office he retained till his death in 1850. Bartolini was a very prolific artist. Besides the works already mentioned, Bartolini executed busts of Cherubini, Mehul, Madame Regnauld, a magnificent statue of Napoleon I. (now in America), several exquisite sepulchral monuments, such as that of lady Stratford Canning in the cathedral of Lausanne, and various groups, the most celebrated of which are his "Charity," and "Hercules and Lycus." In England and France, his style is in general greatly esteemed; in Germany, it is less highly thought of. His figures are characterized by their truthfulness of proportion and classic repose, though they also possess a remarkably life-like expression. After Canova, Bartolini is reckoned the most distinguished Italian sculptor of modern times.

BAR'TOLO, or BAR'TOLI, TADDEO DI, 1390–1414; an Italian painter whose works are found at Padua, Pisa, and Volterra, with some remarkable frescoes in the chapel of the plaza at Sienna.

BARTOLOMEʻO, SAN, a t. of Italy, in the province of Benevento, with a pop. of 5400.

BARTOLOMMEʻO, FRA. See BACCIO DELLA PORTA, *ante*.

BARTOLOZ'ZI, FRANCESCO, an eminent engraver, was b. in Florence about 1730. After practicing his art under Wagner of Venice, he went to Rome, where he executed his admired plates from the life of St. Nilus. He was afterwards commissioned by Mr. Dalton, librarian of George III., to engrave a series of drawings by Guercino, and was induced by the same gentleman to settle in England. Here Bartolozzi produced his spirited and highly finished engravings of the "Virgin and Child" after Carlo Dolci, and "Clytie" after Annibale Carracci, which entitle him to occupy the front rank in his profession. He also engraved numerous specimens of the works of his friend Giovanni Cipriani, of Michael Angelo, Cantarini, Cortona, etc., with equal truth and effect. Bartolozzi likewise enriched alderman Boydell's Shakespeare gallery with many fine engravings. In 1802, he received a flattering invitation from the prince regent of Portugal, to take the superintendence of a school of engravers at Lisbon, whither he repaired three years afterwards, in his seventy-fifth year, and there resided until his death in 1818. He was the grandfather of Madame Vestris, the celebrated comedian.

BAR'TOLUS, Osso, or BARTOLUS DE SAXO FERRATO, 1314–57; professor of civil law in the university of Perugia, and the most famous master of the dialectical school of jurists. He won great reputation by his lectures and writings; among the latter, treatises *On Procedure*, *On Evidence*, and *Commentary on the Code of Justinian*. His magnificent monument in the church of San Francisco bears simply his name.

BARTON, a co. in central Kansas; 1322 sq.m.; pop. '78, 8251; in '80, 10,768. The co. is intersected by the Arkansas river, and by the Atchison, Topeka and Santa Fe railroad; surface undulating and soil productive. Co. seat, Great Bend.

BARTON, a co. in Missouri on the Kansas border; 600 sq.m.; pop. '70, 5087; in '80, 10,332. It is chiefly forest and prairie, with fertile soil, producing corn, wheat, and live stock. Coal and limestone are found. Co. seat, Lamar.

BARTON, BENJAMIN SMITH, 1766–1815; a native of Pennsylvania; educated at Philadelphia, and in Germany; graduated at Göttingen; professor of natural history, botany, and materia medica in Pennsylvania college. Besides many papers in the philosophical and medical journals, he published *Observations on Some Parts of Natural History*, *New Views of the Origin of the Tribes of America*, *Elements of Botany*, *Collections towards a Materia Medica of the United States*, and other medical works.

BARTON, BERNARD, an English poet, b. 31st Jan., 1784, in London. His parents were members of the society of Friends, to the tenets of which body B. adhered through life. In 1810, he became clerk to a banking house at Woodbridge, in which situation he continued until within two years of his death. His first poetical efforts, published in 1812 under the title of *Metrical Effusions*, brought him into correspondence with the poet Southey. *Poems by an Amateur* (1818), and *Poems* (Lond., 1820), increased his reputation and gained him the friendship of Lamb and Byron. *Napoleon and other Poems* appeared in 1822, and was followed within five years by several other productions. All the poems of B. are pervaded by pious sentiment, and some passages display much natural tenderness and religious fervor; but he is, on the whole, rather a fluent, pleasant versifier than a poet. So early as 1824, a reading club founded by him in Woodbridge collected the sum of £1200 sterling, and presented it to him. Some years before his death, he received, through sir Robert Peel, a pension of £100 sterling. In addition to the works mentioned, he published *Fisher's Juvenile Scrap-book* (Lond., 1836), *The Reliquary* (Lond., 1836), and *Household Verses* (Lond., 1845). After his death, which took place suddenly, 19th Feb., 1849, his daughter published *Selections from the Poems and Letters of Bernard Barton* (Lond., 1849).

BARTON, CLARA, b. Maine. She was a teacher in early life, and founder of various free schools in New Jersey. In 1854, she had a clerkship in Washington, but resigned at the beginning of the war of the rebellion and went into hospital service. After peace she originated and carried on at her own cost a systematic search for missing soldiers. Going to Europe for her health, she was assistant to the grand duchess of Baden in estab-

lishing hospitals in the Franco-German war, followed the German army, and was honored with the golden cross of Baden and the iron cross of Germany.

BARTON, ELIZABETH, commonly called "the holy maid of Kent," a wretched creature, subject to spasmodic nervous affections, during which she gave utterance to incoherent exclamations and phrases. About the year 1525, she was servant in a tavern at Aldington, in Kent; and the cunning priest of the parish seeing her in her paroxysms, on the strength of her misfortune conceived the idea of presenting her to the world as a prophetess. Under his directions, she played her part so well that not only the common people, but even men of intellect and education like sir Thomas More, and Barham, the archbishop of Canterbury, were deceived by her. The former, however, afterwards recognized her true character. She became a nun, and when, in 1532, Henry VIII. quarreled with the court of Rome, she was induced to denounce loudly the king's separation from his first wife, and his marriage with Anne Boleyn, and even to prophesy his death. Being arrested by the king's command, along with her accomplices, she made before the judges a confession, which was afterwards publicly repeated before the people, of the fraud which had been perpetrated, and was sentenced to ecclesiastical penance and to imprisonment. She was afterwards accused of high treason, and executed along with some of her accomplices in 1534.

BARTON, WILLIAM, 1747–1831; a native of Rhode Island; and a col. in the revolution. On the night of July 20, 1777, he led a small party across Narragansett bay, passed unobserved by three British war vessels, and near Newport captured the English gen. Prescott. For this act congress gave him a sword, a colonel's commission, and a tract of land in Vermont. He was for many years in prison for debt in Vermont, but was released through the influence of gen. Lafayette, who paid the claim on which he was held.

BARTON BEDS, a group of strata, composed of clay and sand, and forming part of the middle eocene formation, included in the Bagshot series (q.v).

BARTON-ON-HUMBER, a t. in n. Lincolnshire, on the s. side of the Humber, 6 m. s.w. of Hull. It is a very ancient place, having been one of the chief ports of the Humber before the foundation of Hull. It was once surrounded by a rampart and fosse, as a protection against the incursions of the Danes and Saxons. The ferry across the Humber, on the great road from London to Hull, used to be here; but the London and Hull inland traffic has now been diverted from B. by the steam ferry at New Holland, 6 m. below Barton. The chief manufactures are ropes, sacking, bricks, tiles, pottery, and whiting. There are quarries of chalk and oolite. The tower of St. Peter's church, which was built about the time of the conquest, has both round and pointed arches; and, with the part of the building to the w., constitutes one of the few existing examples of undoubted Anglo-Saxon architecture. St. Mary's church is a handsome structure of the 14th century. Pop. '71, 4332.

BARTON'S BUTTONS, exceedingly minute lines engraved on metal by a dividing engine, which produce a surface reflecting various colors. These fine lines are stamped from dies on buttons, etc., which rival gems in brilliancy. John Barton was the inventor.

BARTOW, a co. in n.w. Georgia, intersected by the head waters of the Coosa river, and by the Western, and Atlantic and Rome railroads; 550 sq.m.; pop. '76, 16,566—6774 colored; in '80, 18,694. It is hilly, with fertile soil, producing grain, cotton, and wool; has mines of copper, lead, marble, and limestone. Co. seat, Cartersville.

BARTRAM, JOHN, 1701–1777; a Pennsylvanian farmer, who became, according to Linnæus, "the greatest natural botanist in the world." He visited many sections of the present United States, collecting trees and plants for European gardens, for which the botanists of the time repaid him in books and apparatus. On the Schuylkill near Philadelphia he established the first American botanical garden, and was a member of several foreign societies. He published *Description of East Florida, with a journal.*

BARTRAM, WILLIAM, 1739–1823; a native of Pennsylvania, son of John, and like him a botanist, though he declined a professorship on account of imperfect eye-sight. He settled in Florida and wrote *Travels Through North and South Carolina, East and West Florida, and the Cherokee Country,* and *Observations on the Creek and Cherokee Indians.* He made the most comprehensive list of American birds, previous to that of Wilson, with whom he was a co-laborer.

BARTSCH, JOHANN ADAM BERNHARD, VON, 1757–1821; a German engraver of superior acquirements, member of the academy of fine arts, and director of the imperial collection of engravings; author of *La Peintre-graveur,* in 21 vols., a *Catalogue of the works of Rembrandt,* and other catalogues. He produced more than 500 plates of his own.

BA'RU, a fine woolly substance found at the base of the leaves of the *saguerus saccharifer* (also called *arenga saccharifera*), one of the most valuable sago-palms of the Indian archipelago. It is much employed in calking ships, in stuffing cushions, and for other similar purposes.

BA'RUCH (i.e. the blessed), the son of Neriah, was the person to whom the prophet Jeremiah dictated his oracles. During the siege of Jerusalem by Nebuchadnezzar, both he and the prophet were, by their own countrymen, shut up in a narrow prison, but

obtained from the conquerer freedom and permission to choose their own residence. B. remained for some time in Palestine, but afterwards accompanied Jeremiah to Egypt. His subsequent history is unknown. An apocryphal work in the Greek language has come down to us under his name—viz., the book of B., which contains words of comfort for the Israelites, and predicts the rebuilding of Jerusalem. There is usually appended to it, as chapters vi. and vii., a letter—also apocryphal—of the prophet Jeremiah to the exiles in Babylon.

BAR'WOOD. See CAMWOOD.

BARYE', ANTOINE LOUIS, b. 1795; a French sculptor, and teacher of the art of designing subjects in natural history. He produced allegorical, mythological, and historical works; statues of public men; "Amazon" and "Angelica," modeled from his two daughters; and many other figures remarkable for accurate physiological construction. He also produced many figures of animals in action, such as a lion crushing a boar, and a tiger killing a goat. He was a chevalier and officer of the legion of honor, member of the academy, etc.

BARY'TA, or BARY'TES, or Oxide of Barium (q.v.)—symbol BaO—is the earth present in the minerals *witherite* (carbonate of B.) and *heavy spar* (sulphate of B.). It may be prepared in several ways: 1. By acting upon the carbonate of B. ($BaOCO_2$) by nitric acid (NO_5), which causes the disengagement of the carbonic acid (CO_2), and the nitric acid combining with the B. forms the nitrate of baryta ($BaONO_5$). On evaporating the latter substance to dryness, and igniting the residue, the nitric acid volatilizes, and leaves the baryta (BaO). 2. Another mode of preparing the same substance is to act upon a solution of sulphuret of barium (BaS) by the black oxide of copper (CuO), when an interchange of elements occurs, the sulphur uniting with the copper, producing sulphuret of copper (CuS), and the oxygen with the barium, forming B. (BaO), which remains dissolved in the water, and, on evaporation, deposits crystals in the hydrated condition (BaO, HO). B. belongs to the group of alkaline earths, and has the property of acting like an alkali (q.v.) on coloring matters. It has a very harsh taste, is highly caustic, and is very poisonous. A solution of B. is used by the chemist as the best indication of the presence of carbonic acid gas in the atmosphere, for when a plate or other vessel containing the solution is exposed to the air, the carbonic acid floating across the surface combines with the B., and forms a film of white carbonate of baryta (BaO,CO_2). Otherwise, B. possesses little interest, as it is not put to any commercial or medicinal use. The compounds of B. are, however, of considerable importance. The *sulphate of B.* ($BaOSO_3$), otherwise called *ponderous* or *heavy spar*, is found in the mineral kingdom, diffused in fissures or cracks, passing through other rocks, especially in Cumberland, Durham, and Westmoreland, and in the island of Arran. At the latter place, an extensive mine of heavy spar has been worked for many years.

In its native condition, the sulphate of B. occurs of a crystalline texture, is sometimes found pure and white, but generally presents a flesh-red color, from the red oxide of iron (rust) incorporated in it. The rust can be got quit of by reducing the sulphate of B. to a fine powder under rollers or traveling-wheels, and subjecting the pulverized material to the action of dilute sulphuric acid, which dissolves the red oxide of iron, and leaves the sulphate of B. as a white dense powder. The principal use of *heavy spar* is as a pigment under the name of *permanent white;* but having little opacity, it cannot be employed by itself, but only when mixed with ordinary white lead. When added to the latter, however, it must be regarded as an adulteration, for the little opacity it possesses renders it of service only as an increaser of the bulk of the white lead. Several mixtures of sulphate of B. and white lead are manufactured, and are known in commerce. *Venice white* contains 1 part sulphate of B., and 1 part white lead. *Hamburg white* contains 2 parts sulphate of B., and 1 part white lead. *Dutch white* contains 3 parts sulphate of B., and 1 part white lead. The native sulphate of B. has been employed by the celebrated potter Wedgwood in the manufacture of jasper ware, and for the formation of white figures, etc., on colored jars and vessels. The *carbonate of B.* found native as *witherite*, and the *nitrate of B.*, have been previously referred to in this article and that on BARIUM.

BAR'YTON (Viol di Bardoni), an old chamber-instrument, somewhat like the viol di gamba in tone: had a broader finger-board, with 7 gut-strings, while under the neck there were 16 strings of brass wire, which were touched with the point of the thumb, to produce a sound, while the gut-strings were acted on by a bow.

BARYTON, that species of the human voice which lies between the bass and the tenor, the tone-character of which is more allied to the bass. The compass of a B. voice is from but the principal notes of the voice are from ; and these should possess the energetic character of a bass voice, and, above all, be produced from the chest, excepting perhaps the highest. In former times, the music for this species of voice was written on a stave with the F clef placed on the 3d line, thus:

BAS, or **BATZ**, a small island in the English channel, belonging to France, and situated off the n. coast of the department of Finisterre. Its length is about 3 m., and its breadth 2. It has a light-house, in lat. 48° 45′ n., and long. 4° 1½′ w., on an elevation 223 ft. above the sea, and is defended by 2 forts and 4 batteries. Pop. above 1000, whose chief occupation is fishing.

BASALT', strictly a variety of trap rock (q.v.), although some writers use the words as synonymous. It is composed of the same materials as greenstone (q.v.), and other varieties of trap, viz., hornblende and felspar, with a small quantity of iron; but these exist in a state of finer division than in greenstone, showing that the crystalline action has been stopped at its commencement by the more rapid cooling of the mass. To this is owing its sharp conchoidal fracture and its hardness. As the hardness is frequently accompanied with tenacity, it makes B. a valuable material in the making of roads. It is of a more uniform dark-gray color, approaching to black, than the other varieties of trap.

A rock of a similar appearance and structure occurs as a variety of lava, in volcanic districts. This lava B. differs from the older trap B. in the form which the silicates of magnesia and lime assume when crystallizing. In the newer rocks, they appear as augite; in the older, as hornblende. These two minerals can scarcely be distinguished by their chemical composition, the different formulas given by mineralogists being the result of the presence, in the specimen analyzed, of accidental ingredients or impurities. The slightly differing crystallographic angle has been accounted for by the supposed more speedy cooling of the volcanic rocks. Rose, indeed, has shown that the hornblende of melted greenstone, in recooling, crystallizes as augite; and we have observed that the same change has taken place in specimens of recrystallized B., obtained from works which existed lately at Birmingham for converting this rock into an opaque glass for various economic uses.

The remarkable columnar structure which B. frequently assumes, is its most striking characteristic. The columns vary in the number of their angles from three to twelve; but they have most commonly from five to seven sides. They are frequently divided transversely by joints at nearly equal distances. The direction of the columns is always at right angles to the greatest extension of the mass, so that when B. occurs as a bed, either overlying, or interstratified with the regular strata, the columns are perpendicular, while they are horizontal when the B. exists as a dike.

The columnar structure was at first believed to be owing to a modification of the crystalline force. Such a supposition was favored by the external form of the columns; but the total absence of internal structure showed that the explanation must be sought elsewhere. In 1804, Mr Gregory Watt propounded a theory of the origin of the structure, ascribing it to the pressure of numerous spheres on each other, during the process of cooling, such spheres being produced in planes of refrigeration or absorption. They increase by the successive formation of external concentric coats, until their growth is prevented by the contact of neighboring spheres; and as in a layer of equal-sized spheres, each is pressed on by six others, the result is that each sphere will be squeezed into a regular hexagon. Watt published this theory as the result of his celebrated observations on the cooling of a mass of molten basalt, in which he noticed the production of numerous spheroids, having a radiate structure. Many greenstones, in weathering, present such a structure, giving often to the rock the appearance as if it were composed of a mass of cannon-balls, and Watt's experiments satisfactorily explain this phenomenon; but they will not go further. Anxious, however, that they should throw some light on the structure of basaltic columns, he manages it by the following remarkable assumption: "In a stratum composed of an indefinite number in superficial extent, but only one in height, of impenetrable spheroids, with nearly equidistant centers, if their peripheries should come in contact in the same plane, it seems obvious that their mutual action would form them into hexagons; and if these were resisted below, and there was no opposing cause above them, it seems equally clear that they would extend their dimensions upwards, and thus form hexagonal prisms, whose length might be indefinitely greater than their diameters. The further the extremities of the radii were removed from the center, the greater would be their approach to parallelism; and the structure would be finally propagated by nearly parallel fibers, still keeping within the limits of the hexagonal prism with which their incipient formation commenced; and the prisms might thus shoot to an indefinite length into the undisturbed central mass of the fluid, till their structure was deranged by the superior influence of a counteracting cause." Unfortunately, such dreams too often meet with more acceptance than the drier deductions from observed facts; which must, however, in the end, form the only basis of all geologic science. But there is no occasion here to urge even the most imaginative to resort to hypothesis, for the formation of columns in other substances than B. is quite familiar, and their producing causes evident. In starch, columns having the external prismatic appearance, and the internal earthy structure, are produced simply from the escape of vapor, and consequent shrinking of parts. We have seen singularly regular joints produced in the argillaceous ironstone at Wardie, near Edinburgh, on its exposure on the beach, the contractions forming the columns evidently resulting from the escape of the moisture retained by the bed while it was covered by other strata. The same occurs in beds of fine clay that have been recently exposed. But the most

regular series of columns that have been noticed by us, were produced on bricks which formed the bottom of a public oven. The long-continued and powerful heat to which they had been subjected, though it had not caused fusion, had so affected them as to produce a beautiful series of regular hexagonal prisms. The columns had a diameter of nearly half an inch. Their direction was at right angles to the oven floor. The earthy structure of the brick remained. The columns, in short, were in every respect, except the material of which they were formed, true basaltic columns. It is surely better to look for an explanation of this structure in causes similar to those which have produced the examples adduced, than to find it in such groundless assumptions as are at the foundation of the generally received theory of Watt. The columnar structure of B. seems to have been produced subsequently to the cooling of the mass, by changes in the solid rock, probably from the escape of some volatile matter.

The two best known and most beautiful examples of columnar B. are Fingals Cave, in the island of Staffa, on the west coast of Scotland, and the Giants' Causeway, on the n. coast of Ireland.

BASANTGANJ, a walled t. of India, in the chief-commissionership of Oude, 55 m. n.w. from Allahabad. Pop. 6000, of whom one half are Mussulmans.

BASARJIK, HAJEE-OGLOO-BAZARJEEK (Turkish, "market-town"). One in e. Bulgaria, 25 m. n. of Varna, has 5000 inhabitants, and an annual fair. It was twice taken by the Russians, 1774 and 1810. Another, called TARTAR B., is in the government of Adrianople, on the Maritza; pop. about 5000, one fourth Christians. Trade in rice is the main business.

BASCINET. See HELMET.

BASCOM, HENRY BIDLEMAN, D.D., LL.D., 1790–1850; b. N. Y.; bishop of the Methodist church (south). He was licensed to preach before he was 18 years of age, and began in the Ohio conference; was transferred to Tennessee, and in 1823 was chosen chaplain to congress at the solicitation of Henry Clay. In 1827, he was president of Madison college; 1829–31, agent of the American colonization society, and professor of moral science in Augusta college (Ky.), remaining until 1841; the next year becoming president of Transylvania college (Ky.). He was the writer of the protest of the Southern delegates in the general conference against the action of that body in the case of bishop Andrews, and afterwards a leader in the organization of the southern branch of the church. He was prominent in all questions before the church; was editor of the *Quarterly Review*, and published *Methodism and Slavery*, and a great number of sermons. In the pulpit he was eloquent and impassioned.

BASCOM, JOHN, D.D., LL.D., b. N. Y., 1827; a graduate of Williams college and of Andover theological seminary, and professor of rhetoric in the former. He has published *Political Economy, Treatise on Æsthetics, Elements of Psychology, Science, Philosophy, and Religion*, etc. His style is elaborate, though clear, and his thought profound. He is president of the university of Wisconsin, at Madison.

BASE, in heraldry, the lower portion of the shield is called the B.; there is a dexter base, middle base, and sinister base. The *chief* or principal part of the escutcheon is the top. The shield is always supposed to be on the arm of the wearer, and that it is his right and left hands, not those of the spectator, which are kept in view. The *ground* or surface of the shield, on which all the *charges* or figures are depicted, is called the *field*.

IN BASE.—When any figure is placed in the B. part of the shield, it is said to be *in base*.

BASE (Fr. and Ital.), the foot or lower member of a pillar, on which the shaft rests. Of the classical orders, the Doric column alone had no base. The height of the B. is usually about half the lower diameter of the shaft; and it is divided into the *plinth*, or flat projecting square block or blocks, immediately above the ground, and the *mouldings* (q.v.), or fillets, which surround the column, and are usually circular. In the early Norman style, the bases of pillars still retained, from the Romanesque, forms closely resembling the Tuscan order. As Gothic architecture advanced, and emancipated itself from the arbitrary rules by which the classical orders were governed, bases became infinitely varied in detail, though something approaching to the original conception of a strong and firm foundation for the column, adhered to them throughout.

BASE, in chemistry, is a term applied to a compound body, generally consisting of a metal united with oxygen. Thus, the metal potassium (K), when it combines with oxygen (O), forms the B. potash (KO); sodium (Na) and oxygen, the B. soda (NaO); lead (Pb) and oxygen, the B. oxide of lead or litharge (PbO). A distinguishing feature of a B. is that it unites with an oxygen acid, such as sulphuric acid (SO_3) to form a *salt* (q.v.). Thus, the B. potash (KO) combines with sulphuric acid (SO_3) to make the salt sulphate of potash ($KOSO_3$); potash with nitric acid (NO_5) to form the salt nitrate of potash, or niter ($KONO_5$). Occasionally sulphur replaces the oxygen in a base. Thus, the metal potassium (K) unites with sulphur (S) to form the *sulphur* base, sulphuret of potassium (KS), which can unite with a sulphur acid like sulpharsenious acid or orpiment (AsS_3) to make the salt sulpharsenite of potash (KS,AsS_3). The metal half of a B. need not be a simple element, but may be a compound body which, for the time, plays the part of a

simple substance. Thus, the compound ethyl (C_4H_5) can combine with oxygen to form ordinary ether ($[C_4H_5]O$); and the B. thus produced can, in its turn, combine with acids to form salts. A base may be soluble or insoluble in water. Thus, the bases potash (KO), soda (NaO), ammonia (NH_4O), baryta (BaO), strontia (StO), lime (CaO), and magnesia (MgO), are more or less soluble in water; whilst the oxide of iron or rust (Fe_2O_3), the red oxide of lead ($PhbO_3$), the red oxide of mercury (HgO), are insoluble in water, but soluble in acids. See CHEMISTRY.

BASE, or BASS (from *basis*, the foundation), in music, is the deepest or lowest part, by whatever instrument it may be performed. The B., next to the upper part, is the most striking, the freest in its movements, and richest in effect. Its movement downwards is unfettered, unconcealed, and undisturbed, whereas the middle parts are circumscribed and concealed. In respect to harmony, the B. is the most important part in music, containing more frequently the fundamental notes of the chords, while on it is formed that most important and effective figure in music called "organ-point" (q.v.)—B. is also the name of the lowest and deepest quality of the human voice. The compass of a B. voice is generally from , which should all be chest notes, except, perhaps, the highest. The most useful range, however, is from  . In the characteristic use of the B. voice, the old masters were unquestionably the greatest, especially Handel and Bach. The B. voice only begins to show itself at the years of manhood, and is generally a change from the alto voice of a boy.—B. is also the name of an old stringed instrument, with from five to six strings, tuned variously to suit the music, and played with a bow. It was a sort of middle instrument between the contra-bass and violoncello, but is now out of use. Double B. (contra-bass) is the deepest-toned of stringed instruments.

BASE-BALL, GAME OF, is sometimes said to be the national field-game of the United States, holding the same position in this country as cricket in Great Britain; it has, moreover, the advantage of being a more spirited pastime and far more interesting both to players and to spectators. The average time of a base-ball match is from 2 hours to 2½ hours, whereas a cricket match may extend to 3 days, and then remain undecided. Base-ball was founded on the old English game of "rounders," but bears hardly any resemblance to it in its present form. The first regular B. B. society, called the "Knickerbocker club," was founded at New York in 1845. In 1857, the popularity of this game had increased to such an extent that a national association of base-ball players was formed out of the Knickerbocker, Gotham, Eagle, Empire, Baltic, and Harlem clubs of New York; the Putnam, Excelsior, Atlantic, Eckford, and Continental clubs of Brooklyn, and the Union of Morrisania, all of which were founded between 1845 and 1856. Prior to 1857, the club that was the first to score 21 aces, or runs, was declared winner of the game, but the national association decided to award the victory to the club that scored the largest number of runs, after each side had played 9 innings. The war of the rebellion was a serious interruption to all sport of this character, but in 1865, base-ball began to regain its popularity and to be studied as a profession by many who devoted to it their whole time and energy, becoming experts and receiving pay. It naturally followed that base-ball players were classified as either professionals or amateurs, and that the latter could not be expected to play with the same degree of excellence as the former; the amateurs, therefore, broke up the old association and founded, in 1871, the national association of amateur base-ball players. The other class organized the national association of professional base-ball players, which gave way in 1876 to the league association of professional clubs. In the summer of 1874, the Boston base-ball club and the Athletic club of Philadelphia sailed for Europe, to play a series of exhibition matches in England and Ireland, and caused much surprise at their skill in the game of cricket, acquired by their training as base-ball fielders. From 1871 to 1876, the Boston club, called "Red Stockings," held the championship pennant of the league association of professional clubs.

The ground chosen for a game of base-ball should be a clear, level piece of turf, not less than 500 by 300 ft.; a square of 90 ft. is then marked out by locating its diagonals, and a base is placed at each angle; the home base at the upper point, the second base at the lower point; standing on the home base and looking down the ground, the apex of the triangle on the right hand is the center of the first base, and the apex of that on the left hand the center of the third base. Forty-five feet from the front angle of the home base is then to be measured down the diagonal of the square, in order to fix the center of the pitcher's position, which is 6 ft. square. Lastly, the lines which join the home with the first and third bases respectively, are prolonged, and posts, called foul-ball posts, are set on these lines not less than 100 ft. from the centers of the first and third bases. A ball is fairly hit if it first touches the ground, a player's person, or other object, on or in front of the foul-ball lines. There are nine players on a side, and the theory of the game is that one side takes the field and the other side goes to the bat; the positions of those in the field are as follows: The pitcher stands on his square facing the batsman at a distance of 45 ft. from the home base. The catcher stands at an optional distance behind the bats-

man at the home base, and a man is placed near behind each of the other three bases. The short-fielder is between the second and third bases, behind the pitcher, as a general backer up of the in-field. The out-fielders are in the left, center, and right fields, at some distance behind the second base, to catch the balls and return them to the pitcher or the base men. One of the nine generally acts as captain, stationing and giving directions to his men during the game. After the choice of first innings has been settled by a toss, the pitcher delivers the ball to the batsman by a toss, a jerk, or an underhand throw. If the batsman hits the ball and it is not declared a foul by the umpire, he must endeavor to reach the first base, and afterwards, as occasion offers, the second, third, and home bases. But if, before the batsman can reach a base for which he is running, a fielder, holding the ball, touches that base, or the person of the runner; or if the ball, hit by the bat, is caught before touching the ground; or if a foul ball be caught after touching the ground but once; or if, after the batsman has struck at the ball three times in vain, he fails to touch the first base before the ball is legally held there—he is declared out by the umpire. After a batsman has reached the first base he is not compelled to leave it until the next batsman has struck a fair ball. A run is scored when a base-runner reaches the home base after touching the others in numerical order; if three players of the side are out before the runner makes all his bases, he fails to score. The umpire must be thoroughly conversant with the game, and all the minutiæ of the rules. He is the sole arbiter of every point of play; whether pitching, catching, fielding, striking, or running. The catcher's duty is to catch all balls pitched to the batsman. The pitcher holds the most difficult position of the field side. His tactics are to deceive the batsman as to where a ball is coming, and he must be able to catch any balls hit straight at him. The first, second, and third basemen must all be sure catchers, swift and accurate throwers, and good judges of which base to send the ball to, in order to put an opponent out. The right, center, and left fielder must all be sure catchers, good long-distance throwers, and active runners. The ball must weigh not less than 5 or more than 5¼ ozs., avoirdupois; must not be less than 9 or more than 9¼ in. in circumference, and be composed of 1 oz. avoirdupois of vulcanized india-rubber, covered with worsted and leather. The bat must be of wood, a round stick suitable for handling and striking, and 42 in. long. The bases must be 1 ft. square. No game can be scored unless 5 innings have been concluded on each side, and no game can be drawn unless the play is stopped by darkness or the weather when the scores of the two sides are even. A ball which hits the bat without being struck at, or hits the person of the batter or umpire, is a dead ball, and out of play. The foul-ball lines are unlimited in length, and extend in a straight line from the front angle of the home base, through the centers of the first and third bases respectively. A ball is fairly hit if it first touches the ground, a player's person, or other object, on or in front of the foul-ball lines.

The eight clubs which represent the league this year (1880) are Chicago, Cincinnati, Cleveland, Buffalo, Boston, Providence, Worcester, and Troy.

BASE-COURT (*basse-cour*), the outer court of a feudal mansion, which contained the stable-yard and accommodation for servants. It was distinct from the principal quadrangle, and was sometimes constructed of timber.

BASEDOW, JOH. BERNH. (properly, Joh. Berend Bassedau, or Bernh. von Nordalbingen, as he is often called), a remarkable educationist of the 18th c., was b. 8th Sept., 1723, at Hamburg, where his father was a peruke-maker. He attended the Johanneum there from 1741 to 1744, and afterwards studied theology and philosophy at Leipsic, from which he went in 1746 as a private tutor to Holstein. In the year 1753, he was appointed a master in the academy for young noblemen at Soröe. In 1761, he was removed from the gymnasium at Altona on account of heterodox opinions. Rousseau's *Emile* awakened in him, in 1762, the thought of improving the method of education, and of reducing to practice Rousseau's maxims and those of Comenius. Contributions from princes and private persons, amounting to 15,000 thalers (about £2171 sterling), covered the cost of his *Elementarwerk*, which, after the most pompous announcements, appeared as an *orbis pictus*, with 100 copper-plates by Chodowiecki, and was translated into French and Latin. Therein the young receive a large number of representations of the actual world, whereby B. sought at once to delight the eyes and to awaken a sentiment of cosmopolitanism, at which his whole method aimed. As a model school on this method, he established in 1774 the *Philanthropin* at Dessau, to which place he had been called in 1771. His restlessness of disposition, and the quarrels in which he was involved, especially with his active but capricious coadjutor Wolke, caused him to leave the Philanthropin; but he proceeded with as much eagerness as ever in endeavors to give effect to his ideas by educational works, which, however, aimed more at popularity than solidity, until, after many changes of residence, he died at Magdeburg, 25th July, 1790. His influence on the public mind of his age, particularly in Germany, was very great. He has been justly reproached with disparaging the ancients, a consequence chiefly of his own want of sound scholarship, and with a multitude of exaggerations, mistakes, and conceits; yet it cannot be disputed that his numerous philosophical and educational works powerfully awakened attention and interest in the much-neglected subject of education, and that he set many excellent ideas and weighty truths in rapid circulation among men.

BASEDOW'S DISEASE, GRAVES' DISEASE, or EXOPHTHALMIC GOITRE, a disease characterized by palpitation of the heart, enlargement of the thyroid glands, anæmia, and prominence of the eyeballs; caused, according to some authorities, by paralysis of the vasomotor nerves. It is seldom incurable or dangerous.

BA'SEL, or BA'SLE (Fr. *Bâle*), a city and canton of Switzerland. The canton was divided in 1833 into two sovereign half-cantons, called *Basel-city* (Basel-stadt; in French, Basle-ville) and *Basel-country* (Basel-landschaft; in French, Basle-campagne). The half-canton of Basel-city consists only of the city, with its precincts, and three villages on the right bank of the Rhine: the remainder of the canton forms the half-canton of Basel-country. The canton of B. is bounded by France and Baden, and by the cantons of Aargau, Soleure, and Berne, and has, according to different estimates, an extent of from 170 to about 200 sq. miles. Lying on the northern slope of the Jura, it is a country of hills and valleys. The mountains attain an elevation of from 2000 to 3000 feet. The chief rivers of B. are the Rhine (which flows through the n. part of the canton) and its tributaries, the Birz, and Ergloz. The soil is fertile and well cultivated. The climate, except in elevated situations, is very mild. The inhabitants are chiefly employed in agriculture, the cultivation of fruit-trees and of the vine, cattle-husbandry, fishing, salt-works, the manufacture of ribbons (which are manufactured to the value of £400,000 sterling annually), paper, woolens, linens, and leather. The transit trade is very considerable.

The city of B. arose out of the Roman fortified post of Basilia or Basiliana, near Augusta Rauracorum, of which once more important place the little village of Augst, near B., exhibits a few ruins. On the division of the Frank empire, the district of B. fell to Louis or Ludwig the German. The emperor Henry I., in the earlier part of the 10th c., rebuilt the town, which had been destroyed. It then became a place of importance, and belonged for a time to Burgundy, but after 1032 formed part of the German empire. It became at an early period the seat of a bishop, who, from the 11th c., shared in the supreme power with the imperial governor, a number of noble families, and the burgesses. Amidst many internal and external disturbances, the power of the nobility was gradually broken, that of the bishop restricted, and the authority of the burgesses extended. Surrounding towns were also destroyed, or conquered, and purchased, along with their territories, so that the city extended its dominion over a country district which until very recently was kept in a state of dependence and subjection. Involved in many feuds with the house of Hapsburg, B. closely allied itself to the Swiss confederacy; and after the peace between the emperor Maximilian I. and the confederacy, B. formally joined it in 1501. From 1519 onwards, the writings of Luther were printed in B.; and at the end of twenty years from that time, the reformed doctrine had become generally prevalent, the chapter of the cathedral had left the city, and the convents had been suppressed. After the union with Switzerland, the triumph of the burgess party became also more complete, part of the nobility emigrated, and those who remained were placed upon the same level with the freemen of the municipal corporation. Orderly industry, economy, and an external severity of manners, became the characteristics of the citizens; but the peace of the city was not unfrequently disturbed by strifes consequent upon the assertion of what was deemed undue authority by the magistrates. The government of the city, to which the whole canton was subject, was intrusted to a great and a little council, under the presidency of alternate burgomasters and chief wardens of the guilds; but the little council, uniting legislative and judicial functions with the highest executive authority, became gradually more and more preponderant. All parties in the city, however, remained always well combined against the country district; and persons belonging to the city were appointed to all offices, civil and ecclesiastical, whilst the depression of the country district was completed by the neglect of a proper provision for education. This state of things caused great dissatisfaction, which repeatedly broke out in fruitless rebellion. Under the impulse communicated by the French revolution, equality of rights was conceded in 1798; but in 1814, although the equality of rights remained apparently intact, the new constitution of the canton was so framed, and the representation so distributed, as virtually to make the city again supreme. The discontent of the country district became so great that, after unsuccessful attempts to obtain redress of grievances by petition, civil war broke out in 1831, which did not cease till the troops of the Swiss confederation took possession of the canton, and the diet recognized the separation of the city and the country district, as sovereign half-cantons, in 1833. The constitutions of the two half-cantons are in most respects similar, and are framed on the basis of the old constitution, modified in accordance with the principle of universal suffrage. According to the census of 1870, the half-canton of Basel-city contained 47,760 inhabitants, of whom 34,457 were Protestants; and Basel-country, 54,127, of whom 10,245 were Roman Catholics. By the federal constitution, proclaimed May 29, 1874, the half-canton of Basel-city sends two, and the half-canton of Basel-country three, members to the national council. The capital of Basel-country is Liestal. Since its separation from the city, more ample provision has been made for education, and there has been a rapid increase of material prosperity. Both Roman Catholic and Protestant clergy are paid by the state, and the parishes of the reformed church have received the right of choosing their own pastors.

The city of B. was much more populous in the middle ages than it is now. Its population in 1870 was 44,834. In the 14th c., the number of its inhabitants was greatly reduced by the plague, or "black death" (q.v.), which raged in it with terrible severity, and sometimes mentioned as the "death of Basel." It is well-built and clean, but its appearance does not proclaim it the wealthiest city in Switzerland, which, however, it is. Amongst its buildings are a cathedral, founded in the beginning of the 11th c., by the emperor Henry II., and bridge over the Rhine, built in 1226. The Rhine divides the city into two parts—great B., on the s. side, and little B., on the north. B. is connected by railway with Strasburg on the one hand, and Berne, Lucerne, Zurich, etc., on the other. It has many benevolent and educational institutions, among which are an orphan asylum, and an institution for deaf mutes; a university, founded in 1459, which has a library of 120,000 volumes, and a very valuable collection of manuscripts, a numismatological collection, a botanic garden, and a museum of natural history; the new museum, in which there are several pictures of the younger Holbein, who was long resident in B. (some accounts say he was born here); a public library of 70,000 volumes. During the reformation, the university was a central point of spiritual life, and it has numbered among its professors men of great eminence in learning and science, including Erasmus, who died here in 1536, and the mathematicians Euler and Bernouilli, who were natives of B.; but it is now little frequented. The pop. of the whole canton in 1876 was 107,063.

BA'SEL, COUNCIL OF, a memorable and important ecclesiastical council, held in the city of Basel. It was summoned by pope Martin V., and his successor, Eugenius IV., in accordance with an announcement made at the council of Constance, and was opened on 14th Dec., 1431, under the presidency of the cardinal legate Julian Cesarini of St. Angelo. The hall in which it met is still shown at Basel. It addressed itself to the reconciliation of the Hussites with the Roman Catholic church, and to the reform of abuses in the church itself. But the first attempt to conciliate the Hussites, whom an army of crusaders had in vain sought to subjugate, was met with resistance by the pope, who not only refused his sanction, but empowered the cardinal legate to dissolve the council. The council strongly repelled the pope's pretension of right to dissolve it, and proceeded with its business. His injunctions, that it should remove to Italy, were equally disregarded. It renewed the decree of the council of Constance, asserting the right of a general council to exercise authority over the pope himself, and on his persevering to issue bulls for its dissolution, caused a formal process to be commenced against him, and cited him to appear at its bar. It assumed the papal powers, and exercised them in France and Germany, where its authority was acknowledged. It concluded a peace, in name of the church, with the Calixtines, the most powerful section of the Hussites, by the Prague compact of 20th Nov., 1433, granting them the use of the cup in the Lord's supper. By this, the emperor Sigismund was much helped in obtaining possession of Bohemia; and he in return sought to reconcile the council with Eugenius IV., who, being hard pressed by insurrections in the states of the church, and afraid of losing his whole influence in France and Germany, solemnly ratified all its decrees, by a bull dated 15th Dec., 1433. Desirous, however, of limiting the papal prerogatives, the council restored to the chapters of cathedral and collegiate churches the free right of election to stalls and benefices, of which the pope had assumed the right of disposing; and with a view to the reformation of gross abuses, restricted the power of granting interdicts, and prohibited *annats* and other grievous exactions. It left the pope the right to dispose of those benefices only which belonged to the diocese of Rome, and prohibited the bestowal of reversions to ecclesiastical offices. It also appointed punishments for certain immoralities in the clergy; and prohibited festivals of fools, and all the indecencies which had been commonly practised in churches at Christmas. It adopted decrees concerning the election of popes, and for the regulation of the college of cardinals.

Eugenius, exasperated to the utmost, complained loudly to all sovereign princes. At this time, a prospect was opened up of the union of the distressed Greeks with the church of Rome; and both the pope and the council endeavored to make use of this for the advancement of their own interests and influence. Both despatched galleys for the Greek deputies, but through the intrigues of his agents, the pope was successful, and brought the Greek deputies to Ferrara. The archbishop of Tarentum, a papal legate at B., circulated an ordinance in name of the council, and sealed with its seal, recommending Udine or Florence as the place of conference. The ordinance was a forgery, and this proceeding put an end to forbearance on the part of the council, which, on July 31, 1437, again cited the pope to its bar; and not only on his failing to appear, declared him contumacious, but on his opening an opposition council at Ferrara, went so far as, on Jan. 24, 1438, to decree his suspension from the functions of the popedom. His party, however, was so strong that this decree could not be carried into effect; and some of those who had been among the most influential members of the council, the cardinal legate Julian himself, and the greater number of the Italians, left B., and went over to his side. All the more resolutely did cardinal Louis Allemand, archbishop of Arles, a man of most superior understanding, courage, and eloquence, now guide the proceedings of the council, which, on May 16, 1439, declared the pope a heretic, for his obstinate disobedience to its decrees; and in the following session, formally deposed him for simony, perjury, and other offenses. On this occasion, the holy relics which were in B. were deposited in the places from which the Spanish and Italian members of

the council had disappeared; and the sight of them produced much emotion, and reanimated the courage of the assembly, still consisting of 400 prelates, priests, and doctors, mostly French and German. On Nov. 17, 1439, the council, notwithstanding the still further diminution of its numbers, caused by the plague in B., elected duke Amadeus of Savoy to be pope, who then lived as a hermit in Ripaglia, on the lake of Geneva. He accordingly styled himself Felix V., but was recognized only by a few princes, cities, and universities. The emperor Sigismund was dead, and even France and Germany, although they accepted the reforming decrees of the council, thought proper to remain neutral in the question regarding the popedom. The friendship of the emperor Frederick III. strengthened the party of Eugenius; and the council gradually melted away, till careful only for personal security, its members, after three years of inactivity, held its last session at B. on May 16, 1443, and removed its seat to Lausanne. Here a few prelates still remained together under the presidency of cardinal Allemand, till in 1449, after the death of Eugenius, and the resignation of the anti-pope Felix, an amnesty was offered to them by the new pope, Nicholas V., which they joyfully accepted. The B. reforming decrees are contained in no Roman Catholic collection of decrees of councils, and are held to be invalid by the canonists of Rome; yet they are of authority in canon law in France and Germany, where they were included in pragmatic sanctions, although their application has been modified by more recent concordats.

BA'SEL, TREATY OF. Basel gives its name to two important treaties of peace, concluded there on 5th April and 22d July, 1795, between the representatives of the French republic, Prussia, and Spain, by which Prussia withdrew from the coalition against France, took under her protection all the states of northern Germany which should, like herself, relinquish the war in which the German empire was engaged, and also gave up to the victorious republic her possessions beyond the Rhine; whilst Spain gave up her portion of St. Domingo, and prepared the way for that alliance with France which was afterwards productive of consequences so important.

BASEL'LA, a genus of plants, generally regardsd as belonging to the natural order *chenopodiaceæ* (q. v.), but by some botanists as a type of a distinct order, *basellaceæ*. The species are all tropical. *B. alba* and *B. rubra* are known in Britain as stove biennials. They are plants with twining stems, in commn use as pot-herbs in the East Indies, and cultivated in China. In the neighborhood of Paris, they are raised on hotbeds, transplanted into warm borders, and furnish a substitute for spinach in summer. *B. rubra* yields a very rich purple dye. The great flesh root of *B. tuberosa*, a South American species, also with a twining stem, is edible.

BASE OF OPERATIONS, in military maneuvers, is some spot or line which the general of an army relies upon as a stronghold and magazine. An army cannot take with it all the food, forage, and ammunition for a long war; the consumption is enormous, and a constant supply is indispensable. Again, the sick and wounded cannot accompany the army through toilsome marches; the commander endeavors to send them back to some place of safety. Furthermore, fresh troops must have some spot from which they can safely advance through the enemy's country. To secure all these advantages, a *B. of O.* is necessary. It may be a port, a stretch of sea-coast, a river, a mountain-range, according to circumstances; but it must be such as to serve as a magazine of supply, a place of retreat under disaster, and the end of a line of open communication extending to the spot occupied by the army. When lord Raglan and marshal St. Arnaud advanced from the Alma towards Sebastopol, in Sept. 1854, they intended to attack the great fortress on the north side; but the tactics of the Russians prevented this; and the allies, changing their plan, resolved on the celebrated flank-march to Balaklava, by which they secured the whole coast from Balaklava to Kamiesch as a *B. of O.* during the siege of Sebastopol. See BALAKLAVA. In the military contests arising out of the Indian mutiny, in 1857 and 1858, Cawnpore was the chief B. of O. whence Havelock, Outram, and Clyde made those advances toward Lucknow which led ultimately to the suppression of the revolt. In the Italian war of 1859, the Austrian B. of O. was very fluctuating, owing in part to the disaffected state of the Lombard population around the great fortresses of Mantua, Peschiera, etc.; and indeed the only reliable base was furnished by the eastern and Tyrolese Alps. The French and Sardinian base, in the same war, was virtually Genoa, and the line of country extending thence to the great stronghold of Alessandria.

BA'SHAN, or BATANÆA, a country of Palestine, stretching from mount Hermon in the anti-Libanus on the n., to the brook of Jabbok on the s., and bounded on the w. by the Jordan, its eastern limits not being very clearly defined. Ashtaroth and Edrei were its chief cities, and the residence of its kings during the Amoritish dynasty. The last of its Amorite rulers was Og, who with all his sons was killed by the Israelites under Moses, at the battle of Edrei; and the half tribe of Manasseh settled in the land. The men of B. were remarkable for their stature, its pastures for their richness, and its sheep and oxen for their size and fatness. B. belonged to the tetrarchy of Philip, and afterwards to that of Agrippa II.

BASHAW' (Turkish, *basch;* Arabic, *basha;* Persian, *pasha*, the way in which the word is now commonly written) signifies head, or master, a Turkish title of honor given

to viceroys, provincial governors, generals, and other distinguished public men. The term B. is also used to characterize a man of an arrogant and domineering disposition.

BASHEE' or BASHI **ISLANDS**, a small cluster in the line between Luzon, the chief of the Philippine chain, and Formosa, the lat. and long. being respectively 21° n. and 122° east. Politically, they are a dependency of the Philippines, having been colonized by the Spaniards in 1783. Physically, they form a link in the vast archipelago which, from Formosa to Sumatra inclusive, connects the s.e. of China with the w. of Malacca. They were discovered in 1687 by Dampier, who called them the Bashi Islands, on account of the popularity among the islanders of an intoxicating liquor of that name. Pop. about 8000.

BASHI-BAZOUKS' are irregular troopers in the pay of the Sultan. Very few of them are Europeans; they are mostly Asiatics, from some or other of the pashalics in Asiatic Turkey. They are wild turbulent men, ready to enter the Sultan's service under some leader whom they can understand, and still more ready to plunder whenever an opportunity offers. During the Russo-Turkish war of 1854, etc., they had many encounters with the enemy in that kind of irregular warfare which the Russians intrust to Cossack horsemen; but the peaceful villagers had almost as much distrust of the B. B. as of the Russians. When the British government resolved, in 1855, to take into pay a Turkish contingent, to aid in the operations of the war, a corps of B.B. was put in charge of an Indian officer, but the task of reducing them to discipline was not completed when the war ended. Their ferocity was exhibited in the Servian war, but most relentlessly in the massacre of Batak, where, in May 1876, under Achmet Agha, they slew over 1000 defenseless Bulgarians in a church in which they sought refuge.

BASH'KIRS, or BASHKURTS; a people in Orenburg and Perm, Russia, on the slope and plains of the Ural. They are a mixture of Finns, Tartars, and Ostyaks. Until the arrival of the Hungarians, about the middle of the 13th c., the B. were strong and independent, and troublesome to their neighbors. In 1556, they voluntarily accepted the supremacy of Russia, and the city of Upha was founded to defend them from the Kirghiz. Three times they rebelled, in 1676, 1707, and 1735, but were reduced to subjection. They are now divided into 13 cantons, under the jurisdiction of the gov.gen. of Orenburg. They maintain a military cordon, escort caravans through the Kirghiz steppes, and are employed in various other services. They are divided into settled and nomadic, the former chiefly agriculturists, and the latter cattle raisers. They are hospitable, but suspicious, poor, apt to steal, and exceedingly lazy. They have large heads, small foreheads, eyes narrow and flat, ears standing straight out, and black hair; but are muscular and strong, and capable of enduring much labor and privation. They are of limited intellect, and their Mohammedanism is rather a profession than a practice.

BASIDOH', or BASSADORE', the principal station for British ships in the Persian gulf, situated at the w. end of the island of Kishm.

BASIEN'TO, or BASEN'TO, a river of Italy, which, rising in the Apennines, w. of Potenza, flows in an e.s.e. direction through the province of Basilicata to the gulf of Taranto, which it enters 25 m. w.s.w. of Taranto city. Near its mouth are the remains of the once famous city of *Metapontum*, where Pythagoras died.

BA'SIL, *Ocymum*, a genus of plants of the natural order *Labiatæ* (q.v.). The species are all natives of the tropics, or of the warmer temperate parts of the world, and are generally characterized by a pleasant aromatic smell and taste. They are reckoned among *sweet herbs*.—SWEET B. (*O. Basilicum*) is an annual plant, a native of the East Indies, about one foot high, with ovate or oblong leaves, and flowers in whorls of six, which has long been cultivated in Europe for culinary purposes, being used as a seasoning. It has also enjoyed the reputation of being a palliative of the pains of childbirth.—BUSH B. (*O. minimum*), also a native of the East Indies, is cultivated for the same purposes, and possesses the same qualities. It is a plant about 6 in. high, with an orbicular bushy head. In Britain, the seed of both species, obtained from the s. of Europe, is generally sown on a hot-bed, from which the plants are afterwards removed to the open ground.—A native British plant of the same order (*Clinopodium vulgare*) bears the name of WILD B., and another (*Acinos vulgaris*, formerly *Thymus Acinos*) is known as B. THYME. Both are fragrant and aromatic.—B. vinegar is made in the same manner as mint vinegar, by steeping the leaves in vinegar. It is used for seasoning, in winter, when the fresh plant cannot be obtained.

BA'SIL, surnamed THE GREAT, and called St. B., one of the most eminent and eloquent of the Greek fathers, was b. about 329 at Cæsarea, in Cappadocia; studied under the heathen philosophers at Athens, and became an advocate in his native city, but afterwards founded a monastic society; was ordained a presbyter in 362; and succeeded Eusebius as bishop of Cæsarea in 370, in which office he continued till his death in 379. He resolutely resisted invitations to the court of Julian the Apostate, with whom he had contracted an intimacy as a fellow-student at Athens, and displayed great constancy when the emperor Valens began to persecute him, on account of his opposition to Arianism. He was engaged in most of the controversies of his time, but conducted controversy in a peaceful and generous manner. His rules of monastic life are still followed in the Greek and other oriental churches, in which he is highly honored as one of

the greatest of saints. In the Roman Catholic church, also, they are followed in a few convents, styled of the order of *Basilians*. The influence of B. was greatly felt in the promotion of monasticism throughout the west as well as the east, and to him is ascribed the introduction of the three universal monastic vows of obedience, chastity, and poverty. The best editions of his works are that of the Benedictines (3 vols. Par. 1721–30, fol.), and that of the brothers Gaume (3 vols., Par. 1835–40, 8vo); but the authenticity of many of the moral and ascetic pieces is doubtful. His anniversary is celebrated, in the Greek church, on the 1st of Jan.—the day of his death; in the Latin church, on the 14th of June—the day of his ordination.

BA'SIL I., the Macedonian, emperor of the east, was b. in a village of Macedonia, in 813 A.D., or, according to others, in 826. His early life is differently related, but his biographers agree that he came to Constantinople when still a young man, and was appointed chamberlain to the emperor Michael in 861. Subsequently, the emperor made him his colleague in the sovereignty. B. now used his influence to restrain Michael from committing those excesses which rendered him hateful to the people; but when he found his remonstrances unavailing, he headed a conspiracy against him, the result of which was the assassination of the emperor in 867. His first care was to heal the wounds both of the church and the state. He replaced Ignatius upon the patriarchal throne, and dismissed Photius, whom, however, he re-established in his authority the year after. His valor made him the terror of the Saracens, from whom he reconquered Asia Minor. The prodigality of Michael had exhausted the public treasury; by a wise economy, B. refilled it. All extortioners, moreover, were sought out and punished. The profligate companions of the late manarch were condemned to disgorge one-half of the largesses which Michael had showered upon them. B. also entered into a treaty of alliance with the Russians of Kiew, to whom he sent missionaries to preach the gospel, and who, from that time, began to embrace Christianity, and acknowledge the authority of the Greek church. He died in 886, from wounds which he received while hunting a stag. Several letters of his are still extant, besides a book full of wise advice addressed to his son.

BASIL II., 958–1025; emperor of the east. He and his brother Constantine were kept from the throne by their stepfather, Phocas, until 976. Constantine left the government to B., who had a stormy reign and almost constant war. He suppressed a formidable revolt, defeated the attempt of the emperor of Germany to seize certain Italian districts, and had several conflicts with the caliphs of Bagdad and the Sicilian Arabs. In 987 war began with Bulgaria, and continued with brief interruptions nearly 20 years, when Bulgaria became thoroughly subdued. After one of the hard earned victories in this war, B. ordered the eyes of 99 in every 100 of 15,000 prisoners to be put out, the one spared having to guide his blind companions back to Bulgaria. When the cries of those tortured men were heard by the Bulgarian king, he was so shocked that he died three days afterwards.

BASILE'AN MANUSCRIPTS, two valuable MSS. of the Greek Testament now in the public library of Basle. I. A copy of the four gospels entire except that Luke iii. 14–15, and xxiv. 47–53 are wanting, and that Luke i. 69, ii. 4, xii. 58, xiii. 12, and xv. 5–20 are by a different hand. It is written in uncial letters, round and full, with accents and breathings. Each page contains only one column with the Ammonian sections; and, instead of the Eusebian canons, there are references at the foot of each page to the parallel sections of the other gospels. There are indications of its having been used as a church MS. at Constantinople and it is a good specimen of the class of texts derived from that city. It seems to belong to the 8th c., and the additions to the 9th century. It was presented to a monastery at Basle, in the 15th c., by cardinal Ragusio. It has been collated by several of the best critics, but has never been published. II. A MS. of the entire Greek Testament except the Apocalypse, also presented to the monks of Basle by cardinal Ragusio. It is written in the cursive characters and different parts of it are of very unequal value. The text of the acts and epistles is of slight importance, but that of the gospels is very remarkable and adheres closely to the oldest uncials. There are 38 lines on a page; the writing is excellent, with accents, breathings, *iota subscripts*, and some illuminations. It is assigned to the 10th c., and seems to be the source from which codex 118 of the Bodleian library was copied.

BASILIAN MANUSCRIPT, an uncial copy of the Apocalypse found among ancient homilies of Basil and Gregory of Nyssa. It is named from the Basilian monastery at Rome, to which it formerly belonged. It is now deposited in the Vatican library. Tischendorf, in 1843, was allowed to make extracts from it, and having compared its whole text with a Greek Testament, published the result, which Tregelles afterwards had the opportunity to compare again with the manuscript, and to correct. The letters are simple and unornamented, holding a middle place between square and oblong. The breathings and accents are by the first hand. It probably belongs to the early part of the 8th century.

BASILIAN MONKS, or MONKS of ST. BASIL; an order founded by St. Basil in the 4th c.; it grew to 90,000 in number before the death of the founder. The principal monastery now is at St. Saviour, in Messina. They are numerous in Spain, Italy, and

Sicily, and the greater portion of the monks of the Greek church in Russia are of the order. Their records show that the order has furnished 14 popes, many cardinals, and nearly 12,000 martyrs.

BASIL'ICA, a code of laws of the Grecian empire, the compilation of which was begun in the reign of the emperor Basil I., the Macedonian, who died in 886—from whom it is generally supposed to have derived its name; completed by his son Leo, the philosopher; and revised, in 945, by order of Constantine Porphyrogenitus, the son of Leo. There is some doubt whether the work has come down to us as completed by Leo, or as revised by Constantine, and unfortunately we do not possess the whole of the sixty books of which it originally consisted. It was very much an adaptation of the code of Justinian to altered circumstances, and is of great value for the interpretation of the *Corpus Juris*. The principal editions are that of Fabrott (7 vols. fol. Par. 1647), and the recent one of Heimbach (vols. 1–5, Leip. 1833–50), which includes portions discovered since Fabrott's time. The B. has been the subject of many commentaries.

BASIL'ICA (Gr. *basilike*, from *basileus*, a king). Originally, the B. seems to have been the hall or court-room in which the king administered the laws made by himself and the chiefs who formed his council. When monarchy was abolished at Athens, the second of the magistrates who succeeded to the kingly power was called the archon-basileus, the first being styled the archon by pre-eminence; and it is as the court or hall (stoa) in which the archon-basileus administered justice, that the B. first appears in authentic history. But it was amongst the Romans that the B. attained its chief importance; and in addition to its original use as a court of justice, became a market-place, an exchange, a place of meeting for men of business generally. It was not till a comparatively late period, however, that a B. was erected at Rome. The first we hear of is the B. Porcia in 182 B.C. From this period till the time of Constantine, they were constructed in great numbers. Some twenty are known to have existed in Rome, and latterly, every provincial town, even those of small extent, had each its B., as that of Pompeii, which is now the most perfect example, still testifies. The most frequented part of the city was always selected for the site of a B.; and as this was almost always the forum, the words forum and B. are occasionally used as synonymous by ancient writers. The earliest basilicas were entirely open to the external air. It was usual, for this reason, as well as for the convenience of those who might be compelled to frequent them in bad weather, to select for them a sheltered and convenient position. Latterly, an external wall was substituted for the peristyle of columns with which the original basilicas were surrounded; the external columns, if continued at all, being used only as a decoration, and confined generally to the vestibule. It was in this form that the B. suggested the idea of the Christian church, as has already been explained under apse (q.v.); and the readiest mode of explaining the structure of the B. to a modern, is to imagine the process which was then performed reversed, and in place of converting the B. into a church, to convert the church into a basilica. This will be effected by simply removing the roof from the *nave*, the aisles remaining covered, and even being frequently furnished with galleries, as in Protestant churches. The judge's seat was generally in a circular portion of the building which protruded from its further end, in which the altar was afterwards placed (see APSE), the great entrance to the B. fronting it, as the western door of a cathedral fronts the high-altar. The space required by the pretor for his court was separated by a railing from the other portions of the building, which were devoted to the various purposes we have mentioned. It must not be supposed from this description, that the form of the B. was always the same. Sometimes there was no hemicycle or apse, as in the B. at Pompeii, in which case the tribunal was cut off from the nave; sometimes there were two; as in the B. of Trajan. Again, the B. was sometimes entered, not from the end, but from the sides, where the transepts of a modern church are situated; and at the end opposite that in which the tribunal was placed, there was often a row of small chambers, the uses of which do not seem to be very accurately ascertained, and probably were not invariable. In the plan of the B. of Pompeii, there was an outside stair which led to the upper gallery, which in this case passed entirely round the building. The gallery was the place to which loiterers usually resorted for the purpose of watching the business proceedings below; and the one half of it is said to have been devoted to men, the other, to women. Of the vast size of some of these buildings, we may form a conception from the accommodation which must have been required for the tribunal alone, where, in addition to the curule chair of the pretor, and space required by the suitors and their advocates, seats had to be provided for the *judices* or jurymen, who occasionally amounted to as many as 180.

Many of the principal churches in Italy, and particularly in Rome, are still called basiliche.

The term B. was also applied in the middle ages to the large structures erected over the tombs of persons of distinction, probably from their resemblance to small churches; thus, the tomb of Edward the confessor, in Westminster, is called a B. (see chronicle of the mayors of London, quoted by Parker).

BASILICA'TA, or as it is also called, POTENZA, a province in the s. of the kingdom of Italy, includes nearly the same territory as ancient Lucania. Foggio and Avellino bound it on the n.; Bari and Lecce on the n.e. and e.; the gulf of Taranto and Cosenza,

s.e. and e.; and Salerno and the Mediterranean, on the west. Its area is 4000 sq. miles. Pop. '71, 508,880. The capital is Potenza; the other chief towns are Francavilla and Tursi. B. lies mainly on the e. side of the main ridge of the Apennines, between it and the gulf of Taranto. The interior is wild and mountainous, and though there are some large forests in the province, the general aspect is bare and barren. Four considerable rivers—the Basiento, Brandano, Agri, and Sinno—flow through it from the w. in an e.s.e. direction, forming as many valleys, which slope gradually into an exceedingly fertile plain, varying in breadth from 4 to 10 miles. Here corn is raised in abundance, also wine, hemp, tobacco, and liquorice. Swine, sheep, and goats are reared in the mountainous districts, and silk forms a product of the valleys. B. is greatly in need of good roads, and is much subject to earthquakes.

BASIL'ICON (Gr. "royal," or of great virtue), a name given to an ointment composed of yellow wax, black pitch, resin, and olive oil. Hence it was called *unguentum tetrapharmacum* (*tetra pharmaka*, four drugs). The resin, wax, and pitch are melted together over a slow fire; the oil is then added, and the mixture, while hot, strained through linen. The straining is directed in consequence of the impurities which resin often contains. B. ointment, or resin cerate, as it is sometimes called, is much used as a gently stimulant application to blistered surfaces, indolent ulcers, burns, scalds, and chilblains.

BASIL'ICON DO'RON (Gr. royal gift), a celebrated prose work of king James VI. of Scotland, written for the instruction of his son, prince Henry, a short time previous to his accession to the English throne. It consists of three books. The first treats "Of a King's Christian Duty towards God;" the second, "Of a King's Duty in his Office;" and the third, "Of a King's Behavior in Indifferent Things." It was first published in 1599; afterwards in London in 1603, 8vo; and translated into Latin by Henry Peacham, who presented it, richly illuminated, to the prince. This Latin version was published in London in 1604, 8vo. A French edition appeared at Paris in 1603, 8vo, and another in 1604, 16mo. Like the royal author's famous work on *Demonology*, and his *Counterblast to Tobacco*, the *B. D.* is now only considered as a literary curiosity.

BASILI'DES, an Alexandrian Gnostic, who flourished during the reigns of Trajan, Hadrian, and Antoninus Pius. Regarding his life, little is known. He is said to have taught in Antioch; afterwards in Persia; and, finally, in Egypt, where he is supposed to have died shortly before the middle of the 2d century. He was a disciple of one Glaucias, not elsewhere mentioned in history, but whom he terms an interpreter of St. Peter, and from whom he alleges that he had received the esoteric faith of that apostle. B. probably considered himself a Christian, but his fantastic speculations bore a greater resemblance to the doctrines of Zoroaster, and in some points to the Indian philosophy, than to the religion of Christ. According to the system of B., there are two eternal and independent principles—the one, good; the other, evil. Whatever exists, emanates from these. The good principle—i.e., the supreme God, or Father—constitutes, with his seven perfections, viz., the mind, the word, the understanding, power, excellences, princes, and angels, the blessed ogdoad (combination of *eight*). These seven perfections, or powers, in which the supreme God is reflected, are in their turn themselves reflected, but more feebly, in seven other angelic powers, which emanate from them; and so on through the whole circle of emanations, which amount to 365, the mystic number so often inscribed on the symbolic stones in the Gnostic schools (see ABRAXAS STONES). Each of these angelic powers governs a world. There are, consequently, 365 worlds, to each of which B. gave a name. The head of the 365th, or lowest world, rules the material universe, which, along with other angels, he also created. He is the God or Jehovah of the Old Testament, and when the earth was divided among the rulers of the material universe, the Jewish nation fell to the share of himself, who was the prince of the lowest class of angels. But wishing to absorb all power himself, he strove against the other angels, and to make them subject to his "chosen people," the result of which was war, strife, division in the world, together with the loss of the true religion, to restore which the supreme God sent the first Æon (*Nous*, or intelligence), who united himself to the man Jesus at his baptism, and so taught men that the destiny of their rational spirit was to return into God. This *Nous*, however (who was the true Christ), did not really suffer crucifixion, for, changing forms with Simon of Cyrene, he stood by *laughing* while Simon suffered, and afterwards returned to heaven. B. also taught the doctrine of a purgatorial transmigration of souls in the case of the wicked. His disciples (Basilidians) were numerous in Egypt, Syria, Italy, and even in Gaul, where they continued to exist till the 4th century. They were accused by their enemies of Antinomianism and "magic," but whether on good grounds or not, cannot be ascertained.

BASILIS'CUS, d. 477, Emperor of the East. In 468 A.D. he commanded the armament that Leo I. sent against Genseric, who defeated him. B. seized the throne of the east in 474, but was deposed two years later by Zeno.

BASILISK, according to ancient and mediæval authors, a terrible creature, which, however, may be regarded as entirely fabulous—the fables concerning it being so many and so monstrous, that it is vain to seek for any foundation of truth, or to inquire if any of them originally had reference to any particular creature whatever. The ancients, as Dioscorides, Galen, and Pliny, describe it as a serpent: in the middle ages, it was gener-

ally represented as more of a lizard appearance, but provided with eight instead of four feet. It appears to have been at last pretty completely identified with the cockatrice (q.v.), which was believed to be generated in a very wonderful manner, being produced from an egg laid by an extremely old cock, and hatched by a toad; for which reason we find the B. sometimes figured with something like a cock's head. The B. was the king of dragons and serpents, all of which left their prey to it whenever it approached; whence its name, *basiliscus* (Gr.), diminutive of *basileus*, a king—sometimes exactly translated into Latin by *regulus*. It had some prominences on its head, which, when it was figured in books, assumed very exactly the appearance of a crown. It inhabited the deserts of Africa, and, indeed, could only inhabit a desert, for its breath burned up all vegetation; the flesh fell from the bones of any animal with which it came in contact, and its very look was fatal to life; but brave men could venture into cautious contest with it by the use of a mirror, which reflected back its deadly glance upon itself.—These things are still necessary to be mentioned, were it only on account of the allusions to them by poets and other writers.—The blood of the B. was, of course, extremely valuable to magicians. It occupies an important place in some of the legends of the saints, and pope Leo IV. is said to have delivered Rome from a B. whose breath caused a deadly pestilence.

The word B., and its equivalent *regulus*, are sometimes used in the Latin Vulgate, where the authorized English version of the Old Testament sometimes has *adder*, and sometimes *cockatrice;* but no trace of any of the marvels concerning the B. is to be found there.

BASILISK, *Basiliscus*, in modern zoology, a genus of saurian reptiles of the family of *iguanidæ* (see IGUANA), differing from the iguanas in the want of the dewlap or appendage of skin under throat, and of the series of the pores on the inside of each thigh; also in having a continuous elevated crest along the back and tail, capable of being erected or depressed at pleasure, and apparently intended to aid the motions of the animal in water like the corresponding fin of a fish.—The basilisks are remarkably adapted both for climbing trees and for swimming. Their feet are not webbed, their toes rather long. They are perfectly harmless creatures, very active and lively, and it is difficult to say why they should have received the name of the fabulous monster of antiquity, unless because their appearance is far from agreeable to those unaccustomed to it, and perhaps because an appendage at the back of the head may have been thought to represent the crown of the dragon king. This appendage is most conspicuously developed in the mitred or hooded B. (*B. mitratus*), a native of the tropical parts of America, and consists of a hood or membranous bag, capable of being dilated with air, and then about the size of a pullet's egg, which is supposed, notwithstanding its extremely different situation, to have a use somewhat analogous to that of the air-bladder of fishes. The mitred B. is from 25 to 30 in. long, including the long and very tapering tail. Another and larger species, of a generally greenish color (*B. Amboinensis*), inhabits the islands of the Indian archipelago, and is much used there for food. Its flesh is said to be very white and tender. It is often seen on the branches of trees above water, into which it drops when alarmed.

BASILOSAURUS. See ZEUGLODON.

BASIN, a geographical term of considerable importance. The *B.* of a river is the whole tract of country drained by that river, and is, of course, more or less concave. The line of boundary which separates one river-basin from another is called the water-shed. By tracing these water-sheds, the whole of a country or continent may be divided into a number of distinct basins; and this is one of the most instructive elements in the physical geography of a country. The *B.* of a lake or sea, again, is made up of the basins of all the rivers that flow into it.

BASIN, in geology, is a term applied to depressions in the strata, in which beds of a later age have been deposited. Thus, the London B., consisting of tertiary sands and clays, occupies a hollow in the chalk, which is bounded by the North Downs on the s., and by the chalk-hills of Berks, Wilts, Bucks, and Herts on the north. The term has also been applied to synclinal depressions of strata, which have been produced by the elevation or depression of all the strata contained in the B., as the coal-basin of s. Wales.

BASINGSTOKE, a t. in the n. of Hampshire, 46 m. w.s.w. of London. It is a place of much activity, being situated at the junction of five main roads to London from the s. and w. of England. The country around is fertile and wooded. The chief trade is in corn, malt, coal, and timber. Near the town is a tract of 108 acres, on which every householder has the right of pasturage. There is also, not far from the town, an ancient camp, surrounded by an irregular oval embankment, 1100 yards in circumference, with an entrance on the e. and w. sides. Basing House castle, belonging to the marquis of Winchester, long withstood the forces of the commonwealth, but Cromwell at last took it by storm, and burned it to the ground in 1645. Pop. '71, 5574.

BASKERVILLE, JOHN, a celebrated English printer and letter-founder, was b. in 1706 at Wolverley, in Worcestershire. He became a writing-master in Birmingham, and afterwards carried on the business of japanning there with great success. He began about 1750 to make laborious and costly experiments in letter-founding, and succeeded

in making types which have scarcely yet been excelled. He printed an edition of Virgil, at Birmingham, in 1756, which was followed by other Latin classics, a few English and Italian authors, and a New Testament (Oxf. 1763), much admired as specimens of printing, although not otherwise possessing high merit. His services to the art of printing met with little encouragement and no requital. He d. in 1775. He was a man of obliging disposition, but of a gloomy temperament, and condemned all religious service as superstition. Baskerville was buried in a tomb of masonry in the shape of a cone, under a windmill, in his garden; but the ground becoming valuable for building purposes, his remains were exhumed in the summer of 1821, and deposited in the vaults of Christ church, in the neighborhood of the spot where they were originally interred. Baskerville editions of works are now prized by persons of taste.

BASKET (Welsh, *basged*, or *basgawd*, a netting or weaving of splinters), a domestic utensil, usually made of willows, reeds, or chips, interwoven, although sometimes the materials are gold, silver, iron, glass, etc. Baskets have been in use from very early ages. The Israelites were commanded (Deuteronomy xxvi. 2) to offer unto the Lord, as soon as they came into possession of the land of Canaan, "the first of all the fruit of the earth" in a *basket*. The baskets used on such occasions by the rich Jews were made of gold and silver, and were returned to the offerers; but those used by the majority of the people were of barked willow, and were retained by the priests. The ancient Britons were remarkably expert in the manufacture of baskets, which were much prized by the Romans for their neatness and elegance. The process of basket-making is very simple, and appears to be well known among the rudest peoples—even among the aborigines of Van Diemen's land. In this country the willow is chiefly used in the manufacture of baskets. In several parts of England and Scotland, great attention is paid to the cultivation of the willow; and judging from the statements of some of the cultivators, the returns yielded are very satisfactory. One calculates his profits at £18, 10s. per acre, and another at £10 per acre. The tools required being few and inexpensive, a large number of poor persons are engaged in the manufacture of baskets, that are hawked about the streets by their wives and children. Basket-making also forms a part of the industry of almost all blind asylums. Baskets are of all shapes and sizes, and their uses are so well known to all as to obviate the necessity of description here. Baskets to the value of £30,000 or £40,000 are annually imported from the continent.

BASKET FISH, a species of the genus *astrophyton*, or star-fish, having a most remarkable development of arms. Its body is a five-sided disk, surmounted by the numerous arms. The disk (in one specimen measured) has a diameter of 2¾ in.; and one of the arms is, in its entire length, 9 in., but as it lies coiled up, like a basket, it is about 8 in. across the whole. The size varies with age, but the above is about the average, many being less than half as large, and others twice as great. The upper side of the disk has 10 radial ribs bearing short, blunt spines. The mouth is on the under side, and central. It is set with spiniform bristles hiding 24 thorn-like teeth. From around the star-shaped mouth branch 5 stout arms, each of which is divided at the edge of the disk. The animal is wholly covered with an epidermis, granulated above, but smooth beneath, except that it seems to have a double line of stitches under each arm. The general color is light buff; but the inter-brachial spaces in the living animal vary from dark purple to bright pink. The constant division of each arm at regular intervals into 2 smaller ones is a most remarkable peculiarity. Each of the 5 main branches is divided into 2, making 10 in all; each of the 10 is divided, making 20—and so indefinitely down to the least visible filament. Winthrop counted 81,920 of these "small sprouts, twigs, or threads." On capture or disturbance the creature instantly folds its arms closely about its body, shrinking from the touch like a sensitive plant, and assuming the basket shape from which it gets its familiar name. The attempt to untwist these coils generally ends in breaking the delicate, but tenacious threads. The basket fish is a voracious feeder, and its peculiar construction aids it in taking its prey. The microscope shows each arm and spine to terminate in a minute but sharp hook. The animal, in moving, lifts itself on the extreme end of its long arms, standing, as it were, on tiptoe, so that "the ramifications form a kind of trellis-work all around it reaching to the ground, while the disk forms the roof." This latticed bower is but a trap for entangling heedless little fishes and shrimps, whose escape from those coils is as hopeless as the efforts of a fly to break loose from a spider's web.

BASNAGE DE BEAUVAL, JAQUES, the most distinguished of a distinguished French family, mostly supporters of the Protestant cause, was the son of Henry Basnage, an able advocate in the parliament of Normandy, and was born at Rouen, Aug. 8, 1653. Having studied theology at Geneva and Sedan, he became pastor of the Reformed church in Rouen (1676). That church being interdicted in 1685, Basnage obtained leave to retire to Holland, where he finally settled as stipendiary minister of the Walloon church in the Hague, having gained the friendship of the grand pensionary Heinsius. Here, while zealously discharging his religious duties, he was called upon to take an active part in state affairs, particularly in negotiating the defensive alliance concluded between France, England, and the states-general, 14th Feb., 1717. Amid all these duties and distractions, Basnage cultivated literature with ardor, and was no less distinguished for his extensive learning than for the polish of his manners and the integrity of his character.

Basnage, who commanded in a singular degree the esteem both of Protestants and Catholics, died on the 22d Sept., 1723.

His chief works, which have been frequently laid under contribution without being named, are *La Communion Sainte* (Rott., 1688), a work approved even by Catholics, and often reprinted; *Traité de la Conscience* (Amst. 1696, 2 vols.); *Histoire de l'Eglise* (Rott. 1699, 2 vols. fol.); *Histoire des Juifs* (Rott. 1706, 5 vols.), one of Basnage's best productions, and translated into English by Th. Taylor (Lond. 1708); *Dissertation Historique sur les Duels et les Ordres de Chevalerie* (Amst. 1720).

BASQUE PROVINCES, a district of Spain, in lat. 42° 25′ to 43° 28′ n., and long. 1° 44′ to 3° 25′ w., and comprising the three provinces of Biscay, Guipuzcoa, and Alava, which constituted the ancient *Cantabria*. They form a sort of triangle, the base of which is the bay of Biscay on the n., and the apex the town of Logrono in the s.; the boundary-lines of Navarre on the e., and Santander and Burgos on the w., forming the two sides. The total area of the provinces is about 3000 sq.m., and the population in 1870, 471,989. The surface of the B. P. is very mountainous, particularly that of Alava, which is everywhere cut up into deep narrow valleys by offsets from the main chain of mountains. The rivers of Biscay and Guipuzcoa, none of which are important, empty themselves after a short course into the bay of Biscay; those of Alava flow down the opposite slopes into the Ebro, which carries their waters to the Mediterranean. The climate in all the three provinces is, on the whole, mild and salubrious. The general aspect of the country is very picturesque, the hills in most cases being covered with wood to the very summit. The principal trees are oak, beech, and chestnut. The fruit of the chestnut forms an article both for diet and of export. The soil in the valleys and plains, though not very rich, has been rendered productive by the energy of the people, who spare no labor in the cultivation. But as yet, science and machinery have done little or nothing to assist nature and manual exertion. A spade, or prong-fork, is the chief mechanical aid the Basque peasant has. The farms are small, usually only about four or five acres, and rarely more than can be managed by the farmer and his family. Notwithstanding, the roads and agriculture of these provinces contrast very favorably with those of Spain generally. The products are wheat, barley, maize, flax, hemp, etc.; the wheat, however, only ripening in the most favored localities. Iron is found in abundance; also copper and tin, marble, porphyry, and jasper. The fisheries on the coast are productive.

The Basque race is not confined to the B. P., or to the southern side of the Pyrenees. The greater part of the inhabitants of Navarre (q.v.) are pure Basques. And on the French side of the Pyrenees, three cantons of the department Basses Pyrénées, with a pop. of 145,000, are inhabited by Basques, who, though they retain their own tongue, have not so fully preserved the characteristics of the race as their Spanish brethren.

The Spanish Basques are a simple, brave, and independent people, willing to undergo any hardships rather than surrender their mountain-freedom. None of their many invaders were ever able to effectually subdue or expel them. The B. P. retained till 1876 a separate constitution, guaranteeing them many political and fiscal privileges not possessed by the rest of Spain (see FUEROS). But on the suppression of the Carlist insurrection, which had all along its stronghold in the B. P. and in Navarre, the old immunities were abolished. The Basques are even prouder than Spaniards, and the mere fact of being born in their territory secures the privilege of "universal nobility." *Euscalduna* is the name the Basques give themselves; their country they call *Euscaleria;* and their language, which is peculiarly their own, *Euscara*—the prefix *Eusc* being "the old *Osc, Vesc, Vasq* of Italy and Iberia." The origin of the Basques is doubtful. Humboldt considers them descendants of the ancient Iberi, who once occupied the whole of the peninsula, and spoke the language now confined solely to the B. P.; while Mr. Borrow's opinion is, that the language is of Tartar origin. The Basques are fond of music, and on their chief holiday, Sunday, they indulge in singing, dancing, and single-stick, which they enjoy immensely. For a more particular account of the B. P., we would refer to that excellent manual, *Ford's Hand-book of Spain.*

BAS-RELIEF. See ALTO-RILIEVO.

BAS-RHIN, now a part of the German territory of Alsace-Lorraine; but once a department of France.

BASSE, *Labrax*, a genus of sea-fishes of the perch (q.v.) family, distinguished from the true perches (*perca*) by having the tongue covered with small teeth. The species are found on the shores both of Europe and America. The only British one is the common B. (*L. lupus*), a fish which in its fins, scales, etc., much resembles a perch, but has a more elongated and salmon-like form. It is pretty abundant on some parts of the British coasts, and is not unfrequently taken by angling from the rocks, or by small seine-nets on sandy shores; often, also, by the hand-line and by the long line. It is a strong, active fish, and was well known to the ancients; *labrax* is its Greek name; the Romans called it *lupus* (i.e., wolf), from its remarkable voracity. It is much esteemed for the table. It sometimes attains a large size, 15 lbs. or more in weight, but is generally much smaller. It not unfrequently ascends rivers to some distance, and the experiment of keeping it in a fresh-water pond has even been tried with success.—The striped B., or rock-fish of the United States (*L. lineatus*), very nearly resembles the common B., but attains a larger

size, and is marked by seven or eight longitudinal black lines. The name stone B. is given to the *polyprion cernium*, a fish very rare on the coasts of Britain, but abundant in more southern parts of the Atlantic ocean, as far as the cape of Good Hope, and found on the American coasts and in the Mediterranean. In general appearance it resembles the common perch more nearly than the B., but differs from both in having only a single elongated dorsal fin. It sometimes follows ships of which the bottom is covered with barnacles, is easily taken, and is esteemed excellent for the table.

BASS, *Labras*, a family of fresh-water and sea fishes, abundant in the United States. The sea-bass, *centropristis nigricans*, never comes into fresh water. Its general color is blue black, and the black edges of the scales give its surface a netted appearance; fins pale blue, the anal and dorsal spotted with darker. Teeth are set over all the bones of the mouth. Its weight is very rarely as much as 17 lbs. The striped bass, *labras lineatus*, is the rock fish of the Delaware and Potomac. Color, bluish brown above, silvery below, with seven stripes of chocolate brown. This fish in spring pursues the smelt into shallow water, and devours the spawn of the shad. Its weight reaches 50 to 70 lbs.; it is excellent food, and furnishes choice sport for the angler. A variety which has the lateral bars broken into spots is *L. notatus*, or the bar-fish. The black bass of the lakes, *grystes nigricans*, is blue-black, marked with darker bandings. It frequents all western waters from the St. Lawrence to the Mississippi. Its weight runs to 8 lbs. It is a favorite both before and after it is caught. The Oswego bass, *G. megastoma*, often confounded with the black bass, is distinct by the greater size of its mouth. It is taken in the shallow waters of lake Erie. The white bass, *G. multilineatus*, or white perch, abounds in all the upper lakes. The grass bass, *centrarchus hexacanthus*, is found in company with the Oswego bass. Its weight rarely exceeds 2 lbs. The rock bass, *C. æneus*, is dark copper yellow, with darker clouds; fins bluish green. It is common in the St. Lawrence, in the canals, and in the Hudson. The growler, *grystes salmonus*, is the white salmon of the southern states. Color, deep bluish green, with 25 or 30 longitudinal dark bands.

BASS. See BASE.

BASS, or BASSWOOD. See LIME, or LINDEN.

BASS, EDWARD, D.D., 1726-1803; b. Mass.; graduate of Harvard; ordained in England by bishop Sherlock in 1752, and in 1797 consecrated first Protestant Episcopal bishop of Massachusetts, his diocesal functions being afterwards extended over New Hampshire and Rhode Island.

BAS'SA, or BAF'FA, an excellent port on the Grain coast, Guinea, formerly much resorted to by trading vessels for coarse pepper; latterly for slaves. The country around produces lemons, oranges, and bananas in abundance.

BASSA'NO, a t. of Italy, in the province of Vicenza, 19 m. n.e. of the city of Vicenza, on the Brenta; pop. '71, 7769. It is situated on a rising ground in an extensive plain, and has a considerable trade in wine, olives, silk, leather, etc., as well as a great printing establishment. It has 30 churches, and a number of fine palaces. One of its gates, the work of Palladio, is greatly admired. It is famous for a victory of Bonaparte over the Austrian field-marshal, Wurmser, on 8th Sept., 1796, and was the scene of other battles between the French and Austrians in the wars of that period.

BASSA'NO (or, more properly, GIACOMO DA PONTE), an artist of great eminence, was b. at Bassano, in the n. of Italy, in 1510. He was first educated in the principles of his art by his father, Francesco da Ponte, who was himself a painter of considerable merit, and afterwards visited Venice, where he became a pupil of Bonifazio Veneziano. Here he enjoyed opportunities of studying the designs of Parmegiano, Titian, Tintoretto, and others. The earlier stages of his professional career clearly indicate that these great painters had kindled a rich and emulative enthusiasm in B., for his works display a loftier genius, both as regards conception and execution, than at a later period. His principal effort, belonging to this higher epoch, is a fresco painted on the front of the house of the Michelli family. It represents Samson destroying the Philistines; the figure of the mighty Israelite being considered not unworthy of Michael Angelo. After his father's death, he returned to Bassano, where he devoted himself to a simpler style of art. From this time, however, dates his celebrity. He may even be said to have founded a school, whose peculiarity was the delineation of common things, markets, fairs, country inns, farm-yards, etc. He had a passion for introducing cattle into his pictures, even under the most inappropriate circumstances. The special merits of this lower style, into which B. finally lapsed, are its vigorous and picturesque coloring, and its accurate imitation of nature. B.'s landscapes, however, betray a comparative ignorance of perspective. Occasionally, during his later years, B. showed that his early love of the sublime was not wholly extinguished, by painting several altar-pieces, which exhibit a noble grandeur of execution, such as the "Entombing of Christ," in the church of St. Maria. Padua; a "Nativity," now in the Louvre, Paris; "St. Roche interceding with the Virgin for a People infected with the Plague," at Vicenza; "The Wise Men's Offering," and the "Seizure of Christ in the Garden." His rural pictures are abundant in the Italian galleries and in English collections. B. also painted heads of several of his contemporaries, Tasso, Ariosto, etc., and was in high favor with the emperor Rudolph II., for whom he

also executed several works. He d. in 1592. He left four sons, who all followed their father's profession, but were not marked by any special originality of manner.

BASSA'NO, HUGUES BERNARD MARET, Duke of, 1763–1839; a French statesman. At the commencement of the revolution he edited the *Bulletin* (the original of the *Moniteur*), containing the proceedings of the constituent assembly, a position which gave him much political influence. In 1791, he was at the head of a bureau in the ministry of foreign affairs, and was sent to England to re-establish suspended diplomatic relations, but he was unsuccessful. In 1793, he was appointed ambassador to Naples, but while on his way was captured by the Austrians, and kept two years a prisoner, being finally exchanged for the daughter of Louis XVI. In 1797, he was one of the negotiators of peace with England. Bonaparte employed him as his private secretary, and he afterwards became secretary of state, in which position he managed the newspapers and exercised great influence over Napoleon, assisting in all his diplomatic business. In 1811, he had direction of foreign affairs; Napoleon made him duke of B., and retained him as his most intimate adviser. He was in exile during the restoration, but Louis Philippe restored him to the peerage in 1831, and for a short time he acted as president of the cabinet.

BAS'SARIS, a genus of animals in North America representing the civet of Europe. They are about as large as common cats, and may be easily tamed. They live in trees, and catch birds, mice, etc. The tail is bushy, and marked with rings like that of the raccoon.

BASSE-CHANTANTE, in music, the higher of the two basses in a score, partaking of more melody, and performed by the violoncello.

BASSE-CONTRAINTE, a French term in music, meaning a bass melody of a few bars repeated throughout the piece, while the other parts vary.

BASSEIN', the name of two cities in India.—1. B., *in Pegu*, the capital of a district of the same name, stands on the left bank of an arm of the Irrawaddy, which joins the bay of Bengal a few miles to the s. of Cape Negrais. It lies in lat. 16° 45′ n., and long. 94° 50′ e.; and though it is 90 m. from the sea, yet it is easily and safely accessible to the largest ships. In a military view, also, the place is important, as it completely commands the navigation of the stream. It was captured by the British in 1852. Pop. '72, 20,688. The district of B. has an area of 8954 sq.m., and a pop. of (1872) 316,833.—2. B., in the *presidency of Bombay*, is situated on an island of the same name; lat. of the island, 19° 20′ to 19° 28′ n., and long. 72° 48′ to 72° 54′ e. It appears to be the mere wreck of former grandeur, having been found by bishop Heber, in 1825, with many churches and convents, to be altogether uninhabited and desolate. In 1534, it was ceded to the Portuguese; in 1765, after a possession of 231 years, it was wrested from them by the Mahrattas; in 1780, it surrendered to the British, after a regular siege of 12 days. The island, which contains about 35 sq.m., is separated from the continent by a narrow channel, which, as a shelter for shipping, constituted its value in the eyes of the Portuguese. Historically, B. is of some interest, having been promised, though never delivered, as part of the dowry of Charles II.'s Portuguese consort.

BAS'SES, two ledges of rocks to the s.e. of Ceylon, distinguished as *Great* and *Little* —the former group being more to the s.w., and the latter more to the n.e. They lie in n. lat. 6° 11′ to 6° 26′, and in e. long. 81° 40′ to 81° 59′. Their importance arises merely from their position, which is in a great thoroughfare of traffic.

BASSES-ALPES, a department of France on the Italian border, 2685 sq.m.; pop. '76, 136,166. It is sparsely populated, only 20 persons to a square kilo; watered by the Durance; mountainous, with good pasturage, and famed for raising plums. Chief town, Digne.

BASSES-PYRÉNÉES, a department of France bordering on Spain and the bay of Biscay; 2943 sq.m.; pop. '76, 431,525. The rivers are the Nive, the Odour, and the Bidouze. About half the surface is marshy. There are mineral springs of value, and much industrial activity; trade is carried on through the city and port of Bayonne. Capital, Pau.

BASSE-TERRE, a French term, equivalent to the English *lowlands*, or, rather, *lowland*, appropriately applied to several localities in the West Indies.—1. The capital of St. Kitt's, on the w. coast, in lat. 17° 17′ n., and long. 62° 42′ west. It is a low, hot, dusty place, standing at the outlet of a lovely valley of the same name. Its pop. is about 9000, and its trade, as the port of the island, is considerable. The designation of the valley and town is a memorial of the former occupation of the half of St. Kitt's by the French.—2. The capital of Guadeloupe, giving its name to the larger of the two islets into which Guadeloupe is divided by an arm of the sea, known as Salt river. B. stands on the s.w. coast, in lat. 16° n., and long. 61° 44′ w., having nothing worthy of the name of harbor, but merely a roadstead. It contains about 13,000 inhabitants.—3. The chief town of Marie Galante, a dependency of Guadaloupe, which is about 12 m. to the n.w. It is otherwise ambitiously called Grand Bourg.

BAS'SET HORN (corno di basetto), the richest and softest of all wind-instruments, invented in Passau, in 1770, improved by Lotz in Presburg, in 1782. It is similar to a

clarionet in tone and fingering; its compass is two and a half octaves, the notes written for it being from 
, but the instrument sounds a fifth lower than the notes are written.

BAS'SI, LAURA MARIA CATERINA, 1711-78; an Italian lady of Bologna, distinguished for learning. She received a doctor's degree, and was made professor in the philosophical college, where she lectured on experimental philosophy until her death. She was a member of many societies, and conducted an extensive correspondence with eminent men of learning; was well acquainted with the classics, and also with the literature of Italy and France. In 1738 she married Dr. Guiseppe Verrati.

BAS'SIA, a genus of plants of the natural order *sapotaceæ* (q.v.). The species are trees, tropical or sub-tropical, the flowers of which are remarkable for their fleshy corolla, and for the abundance of oil or butyraceous fat which the seeds contain, and which is used for many purposes by the inhabitants of the countries to which they are indigenous. The fruit has a pulpy rind, and three or four one-seeded cells. The ovary has eight cells; but some of them are always abortive. The BUTTER-TREE, described by Mungo Park as growing in the interior of Africa, in the country of Bambarra, has been supposed to belong to this genus, and named *B. Parkii.* According to the eminent botanist, Robert Brown, however, the seed of the butter-tree, as figured by Park, scarcely belongs to the genus B., but rather to the nearly allied genus *vitellaria* or *lucuma.* It produces the *galam butter,* also called *shea butter* (i.e., tree butter), which is highly valued, and forms an important article of internal commerce in the interior of Africa. The seeds of the fruit, which resembles an olive, are dried in the sun, or in a peculiar kind of oven, and the kernels are then boiled in water, in order to obtain the butter from them, which not only keeps for a whole year without salt, but is also whiter, more solid, and more pleasant to the taste than the butter of cows' milk. This butter is used both as an article of food and of medicine. It has been supposed that the introduction of this tree might be of great importance in other tropical countries.—The MADHUCA, MAHWA, or MAHOWA tree of the East Indies (*B. latifolia*) is described as resembling a good oak in size, and is a valuable timber-tree. It is found in the mountainous parts of the Circars, Bahar, Bengal, etc. Its flowers are eaten raw, and a kind of arrack or spirit is distilled from them. The seeds yield, by expression, a considerable quantity of a concrete greenish-yellow oil, which is used for lamps, and occasionally for frying articles of food.—The Indian BUTTER-TREE, or PHULWARA or FULWA TREE (*B. butyracea*), is found in some of the more mountainous parts of India, and attains a height of 50 feet. Its timber is light and of no value. The leaves are 6 to 12 in. long. The fruit is of the size of a pigeon's egg, and although eaten, is not much esteemed; but from the seed, a concrete oil or butter is obtained, by expression, of a delicate white color, much valued for medicinal uses, and as an unguent.—The seeds of the ILLUPIE-TREE, or Indian OIL-TREE (*B. longifolia*), a native of Coromandel, yields a large quantity of oil, which is used for lamps, for soap-making, and in cookery. The flowers are much esteemed for eating; and the wood is almost as hard and durable as teak.

BASSIM, a t. of India in the district of that name in the province of Berar Pop. in 1872, 8531.

BASSINET. See HELMET.

BASSOMPIERRE, FRANÇOIS DE, Marshal of France, was b. in 1579, at Harnel, in Lorraine. Belonging to one of the oldest French families, he came, at the age of 20, to the French court, where he gained the favor of Henry IV. After the murder of Henry IV., he attached himself to the party of the queen, who appointed him col. of the Swiss guards; but on the murder of Concini, he sought to establish himself in the favor of the young king, and when the quarrel broke out betwixt mother and son, he particularly contributed to the overthrow of the former. He was raised to the rank of marshal of France in 1622; was sent on embassies to Spain, Switzerland, and England; was actively employed in the siege of La Rochelle; took the pass of Susa by storm in 1629; and commanded for a little while the troops raised in Languedoc against the Huguenots. He beecame, however, an object of suspicion and dislike to Richelieu, who caused him to be cast into the bastile in Feb., 1631, from which he was not liberated until the death of Richelieu, in 1643, after he had been 12 years imprisoned. He d. in 1646. He was an accomplished courtier, extravagant, and excessively addicted to gallantries. At the time of his arrest, he destroyed 6000 love-letters. His *Mémoires* (2 vols., Cologne, 1665; 4 vols., Amst., 1723), written in the bastile, are rendered interesting by their spirited style.

BASSOON (Ital. *fagotto*), a well-known wind-instrument of the reed species, made of maple-wood or plane-tree. The B. is an Italian invention; its name fagotto, meaning *a bundle,* probably from its being made in different pieces laid one against the other. The French call it *basson de hautbois;* the Germans retain its Italian name. Its invention is attributed to Canonicus Afranio, in Ferrara, in 1539. In the middle of the 16th c., it had already reached great perfection. Sigmund Schnitzer, in Nuremberg, who d. in 1578, was a celebrated maker. The B. consists of a bored-out tube of wood in several pieces,

fixed together alongside each other, so as to bring the holes and keys within the reach of the fingers of each hand. The B. has, in general, not less than 8 holes and 10 keys. In the narrow end of the wooden tube is fixed a small tapering brass tube in the form of an S, on the end of which is placed the reed for producing the tone. The compass of the B. is from , but the best tones are those from . The lowest C sharp, and B natural, are wanting. The notes for the B. are written on the bass clef for the lower part, and on the tenor clef for the higher. The best keys for the B. are E flat, B flat, F, C, G, D, and A; all the other keys are more or less difficult. For military bands there are different sizes of bassoons—one a fourth lower; another, the contra B, an octave lower; and a third, the tenor B, a fifth higher—all of the same construction. The best instruction books for the B. are by Almenräder, Fröhlich, Ozi, and by the Paris conservatorium. B. is also the name of an organ-stop, the pipes of which are made to imitate the tones of the instrument.

BASSORA, Bussora, or Basrah, a t. of Asiatic Turkey, pashalic of Bagdad, is situated on the western bank of the Euphrates, here called the Shat-el-Arab, about midway between the mouth of the Tigris and the Persian gulf, from which it is 70 m. distant. Lat. 30° 30′ n., long. 47° 34′ e. There are many gardens within the walls of the city, and many plantations of roses around it, but it is very dirty. The river, which is navigable up to B. for ships of 500 tons, is there divided into a number of channels, and by evaporation and frequent overflowing makes the climate very unhealthy. The inhabitants, once 150,000, now only 5000 in number, are for the most part poor Arabs and Persians; the officials and military alone are Turks. Commerce is in the hands of Armenians. Most of the houses are low huts, built of unburned bricks. An extensive trade is carried on in the exchange of the productions of Turkey and Persia with those of India, and also in European goods, particularly articles of British manufacture. Amongst the exports are strong and beautiful horses, and dates, which are grown in great abundance. Caravans travel to Persia, and also by Bagdad and Aleppo to Constantinople. It has steam communication with Bombay and Bagdad. To guard against the incursions of the Arabs, a wall of about 9¼ m. in length has been erected in the neighboring desert, at all the gates of which a watch is maintained. B. was founded in 626 by the caliph Omar, and soon became one of the most famous and opulent cities of the east. The possession of it has been the subject of many contests between the Turks and the Persians. It is a place of great note in the history of Arabic literature.

BASSORA GUM, a whitish or yellowish-opaque substance resembling gum-arabic, but differing from it by being mostly insoluble in water. Its source has not been satisfactorily ascertained.

BASSO-RILIE'VO. See Alto-rilievo.

BASS ROCK, a remarkable island-rock near the mouth of the firth of Forth, about 2 m. from Canty bay, Haddingtonshire, opposite the ruined castle of Tantallon. It is composed of hard granular greenstone or clinkstone, and is about a mile in circumference, nearly round, and 400 ft. high. It is inaccessible on all sides except the s.w., where it shelves down to the water, and there the landing is difficult, and almost impossible, when there is any swell. On the w., n., and e., the precipices rise perpendicularly out of the sea, to a great elevation. These are the abode of immense numbers of solan geese (it is estimated that 10,000 to 15,000 of these fowls resort here annually) and other aquatic birds, which give to the surface of the precipices a snowy appearance in the distance. A cavern traverses the rock from w. to e., and is accessible at low tide. There is a spring on the island, and a few sheep are pastured on it, the mutton of which is much prized. How early the Bass was tenanted, is doubtful; but there is a tradition to the effect that St. Baldred resided on it as early as the 7th century. It is also not very certainly known when the Bass was first fortified, but it formed a retreat for the son of Robert III., afterwards James I. of Scotland, before his nineteen years' captivity in England. James VI. visited the Bass in 1581, and was anxious to obtain it for state purposes; but its owner, "Lauder of the Bass," refused to part with it. The registers of the church of Scotland were sent to the Bass in 1651, for preservation from Cromwell; but the protector forced their surrender in the following year. In 1671, Charles II. purchased the rock for £4000, and within its dreary dungeons many of the most eminent of the Covenanters were confined during that and the following reign. It is a somewhat curious fact that the Bass was the last spot in the British islands which held out for the Stuarts. A mere handful of adventurers in the Jacobite interest, 24 in number, had the address to capture the island, and to retain it in name of king James, from June, 1691, till April, 1694, against all the forces which the government of William III. sent against them; at last, the spirited little garrison surrendered on honorable terms, and only from a consciousness of failing provisions. For an account of this romantic incident, see *Pictorial History of England*, vol. iv. p. 16, new edition. In 1701, the fortifications were demolished by order of William III. Five years afterwards, the Bass passed into the possession of Sir Hew Dalrymple, to whose lineal descendant it now belongs.

The king of the Belgians (then prince Leopold) visited the rock in 1819, and three years afterwards, George IV., on passing it on his voyage to Scotland, was honored with a royal salute from some guns then on it. It has also been visited by the prince of Wales. The Bass is let to a "keeper," who pays a considerable sum for it annually, the rent being made up by young geese, which are used as food; by eggs, feathers, and oil; also by fees exacted from visitors to the rock. There is an interesting volume on the Bass, historical, geological, and botanical, the joint production of Dr. M'Crie, jun., Hugh Miller, and professors Fleming and Balfour.

BASS ROCK, an island of stone near the firth of Forth, Scotland, about a mile in circumference, and 400 ft. high, traversed by a cavern. The rock is accessible only on the s.w. side. It is a favorite haunt of aquatic birds. Charles II. bought the B.R. for a prison for Covenanters; and a few partisans of James II. held it nearly three years against frequent attempts at capture by large bodies of Protestants.

BASS'S STRAIT separates Tasmania from Australia. It contains many islands, chiefly in its southern section, and is greatly beset by coral-reefs. It runs almost due e. and w., has an average breadth of about 200 m., and is pretty nearly bisected by the parallel of 40°.

B. S. deservedly bears the name of its explorer, who, without having been professionally a seaman, is entitled to a very high place among maritime discoveries. After having made shorter excursions from Port Jackson, in a mere wherry of 8 ft. in length, Mr. Surgeon Bass resolved to settle, in a whaling-boat, the question as to the connection or separation of New Holland and Tasmania. In his frail craft, he penetrated as far as Western Port, near the entrance of Port Phillip, where, from the trending of the land and the swell of the sea, he inferred that he had most probably reached the open ocean. He did not rest contented, however, until, in a tiny bark of 25 tons, he actually circumnavigated Tasmania. The discovery, so deliberately prosecuted, and so satisfactorily completed, soon proved to be fertile of results; for in 1802, only four years after the exploration of Bass, Port Philip was entered; in 1804, Tasmania was colonized; and now the strait is the highway for a trade of more than a million sterling between Victoria and Tasmania—a trade which has very recently received an additional impetus from the laying of a telegraphic cable between the two colonies at their joint expense.

BASSUTOS, a tribe of the Bechuanas in s. Africa, estimated 100,000 in number. They have made some progress in agriculture and civilization under the influence of French missionaries. In 1836, the B. were obliged to cede a part of their territory to Orange Free state, and in 1868 the remainder was united with Natal.

BAST, or BASS, also called *inner bark*, *liber*, or *endophlœum* (see BARK), the fibrous inferior layer of the bark in the stems of exogenous plants, which is particularly conspicuous in exogenous trees, as a peculiar substance interposed between the true bark and the wood. It consists in great part of sap-vessels (laticiferous vessels, see LATEX and SAP) lying close together, and assuming the appearance of tough fibers. In a fresh state, it has generally a whitish color; and it is often composed of several layers, to which, however, the collective name of bast-layer is very often applied. The uses of this part of plants in the arts are very numerous; the fibers of hemp, flax, jute, etc., are nothing else than bast. The name B., however, is more commonly applied to the inner bark of trees, and is originally Russian, designating the inner bark of the lime-tree (q.v.) or linden-tree, which is employed for making a coarse kind of ropes, mats well known as bast-mats, and a kind of shoes much worn by the Russian peasantry. The trees are cut when full of sap in spring. For B. to be plaited into shoes, young stems of about three years old are preferred; and it is said that two or three are required to make a single pair of shoes. Trees of six or eight years old are cut down for the better kind of mats, which are exported in large quantities from Russia, and particularly from the port of Archangel, and so much used for packing furniture, for covering tender plants in gardens, supplying strands with which plants are tied, etc. The trees from which the B. is taken are very generally burned for charcoal. After the bark is dried, its layers are easily separated by steeping in water. The finest layers are the inner, and the coarser are the outer ones.—The manufacture of bast-mats is nearly confined to Russia and Sweden. Not fewer than 3,500,000 are annually exported from Russia, and from 500,000 to 800,000 are annually imported into Britain. A few are made in Monmouthshire. Lime-tree B. is used in the s. of Europe for making hats. The name bast-hat is, however, very often given to a hat made of willow-wood planed off in thin ribbons, and plaited in the same manner as straw-hats. The inner bark of *grewia didyma*, a tree of the same natural order with the lime-tree, is used for making ropes in the Himalaya mountains.

BASTARD BAR. In popular speech we frequently hear of a *bar-sinister*, as a mark of bastardy. But a bar-sinister, strictly speaking, is an impossibility, inasmuch as the bar (q.v.) is not formed of diagonal but of horizontal lines. A bend-sinister (q.v.), which, by the French, is called a bar, has with more reason been confused with the true mark of illegitimacy, and has on that account been avoided even by heralds. But the real B. B. differs very essentially from the bend-sinister, being half of the scarp, which again it half of the bend-sinister. "The half of the scarp," says Nisbet, "with the English, is

called a baton-sinister; by the French, baston-sinister; it is never carried in arms but as a mark of illegitimation, commonly called the bastard bar." In modern practice, the baton does not touch the extremities of the shield, or of the quarter in which the paternal arms are placed, but is *couped*—that is, cut short at the ends. In this form the baton, when used as a mark of illegitimacy, is placed over the paternal coat of the bastard, whether used singly or in a quartered shield. Nisbet informs us that the baton-sinister, both in England and Scotland, is comparatively of modern invention, natural children in earlier times not having been permitted to assume the arms or even the names of their fathers. "The unlawful children of John of Gaunt, duke of Lancaster, begot on Katharine, daughter of sir Payen Roat Guyn, king of arms, did not carry the arms of their father the king, though nobilitate, with a baton-sinister, as now used; . . . but after the legitimation of these three natural sons by act of parliament, they then assumed the sovereign ensigns of England, within a bordure gobbonated (q.v.), argent and azure."

According to the practice of France, which probably was followed in England also, the bastard could not cancel or alter the baton without the consent of the chief of the family, or the authority of the sovereign. Even where the baton was not removed, it was common for the sovereign to grant his permission to carry it *dexter*, in place of sinister. Charles VII. of France allowed John, the bastard of Orleans, for his valor against the English, to turn his sinister traverse to the dexter, with which he and his issue afterwards *bruised* the arms of Orleans, as dukes of Longueville. The same privilege was granted to James, earl of Murray, natural son of king James V. of Scotland, by his sister queen Mary, and he thenceforth carried the lion and tressure of Scotland thus bruised, quartered with the feudal arms of the earldom of Murray. The general practice of the milder heraldry of our own day is to substitute the gobbonated bordure for the B. B., not only in the case of the legitimate children of bastards, but of bastards themselves.

BASTARD EIGNÉ is the name given in English law-books to an eldest son illegitimate by birth, but whose father and mother were subsequently married, and had other children born in wedlock. See BASTARDS AND BASTARDY.

BASTARDS and **BASTARDY.** Bastards, as described by Blackstone, are such children as are not born either in lawful wedlock, or within a competent time after its determination. The Scotch lawyers, again, true to their peculiar law of marriage, define a bastard as a child born of a woman, who was not married to the father at the time of conception, *and who was never thereafter married to him.* It was at one time the law of England, when divorces *a mensa et thoro* were adjudged by the ecclesiastical courts, that if the wife had children during the legal separation occasioned by the former kind of divorce, such children were *primâ facie* bastards—for the law presumed the parties to live conformably to the sentence of separation. But in modern times, the presumption has changed, and now always favors legitimacy.

Bastards are incapable of inheriting real property; nor can they claim any share of personal estate as next of kin to a party dying intestate. They are said to be *filii nullius*, or *filii populi*, the sons of nobody, or the sons of the people, having no inheritable blood in them. As laid down, however, in many authorities, and among others in the last (4th) edition of Stephen's *Commentaries*, there is an exception to this rule in the case of a bastard *eigné* and *mulier puisné*, and where, it may be observed, the principle of the Scotch law of legitimation appears to some extent to be admitted. Thus, where a man has a bastard son, called a *bastard eigné* (q.v.), and afterwards marries the mother, and by her has a legitimate son, who, in the language of the law, is called a *mulier puisné*—if the father dies, and the *bastard eigné* enters upon his land, and enjoys it to his death, and dies seized thereof, whereby the inheritance descends to his issue, the *mulier puisné* and all other heirs are totally barred of their right, because the laws of England pay such a regard to a person in the situation of the *bastard eigné*, that after the land had descended to his issue, they would not unravel the matter again, and suffer his estate to be shaken. But this indulgence was shown to no other kind of bastard; for if the mother was never married to the father, such bastard could have no colorable title at all. And the above exception would almost appear to be the law of England at the present day. But a recent statute renders this opinion somewhat doubtful, for by the 3 and 4 Will. IV. c. 27, s. 39, it is enacted that no *descent cast*, after the 31st day of December 1833, shall defeat any right of entry or action for the recovery of land. By descent cast is meant an heir of a party who had contrived illegally to enjoy the land without challenge during his life, and was thereby enabled to transmit it to his heir, who thenceforward had a title which could not be impeached either by the original rightful owner, or by any of his descendants. The above statute, however, has cut off the rights in this behalf of all such descents cast, and the true owner can now, under the provisions of the act, always recover. But is the son of a *bastard eigné* such a "descent cast" as is contemplated by the 3 and 4 Will. IV. c. 27? It may be doubted whether he is. The expression "descent cast" is generally applied in law-books to the case of a *stranger* who, under a forcible, wrongful, and illegal entry on the land, had succeeded in diverting the inheritance from the direct and original channel. But such is not the position of a *bastard eigné*. He is not, in any sense of the word,

a stranger; nor is the above privilege or favor allowed him and his family at all in respect of his position towards, or of anything that can be called his title to the *land*, but such privilege and favor are given him solely because of his *peculiar bastardy*. In fact, it is just because he is *not* a stranger, but his father's eldest son by birth, that the law from ancient times decided that he should not be altogether deprived of what otherwise would have been his natural rights. The rule, as we have suggested, appears to be founded on the principle of the Scotch law of subsequent legitimation; and the intention probably was to give effect to the good feeling of the second or other legitimate son, who, from a regard to his mother's character, as well as his brother's position, might find himself excused from asserting his claims. Whether the above statute can, by its general terms, be understood arbitrarily to alter such a reasonable and natural law of family succession, is a question for lawyers and law-courts. The point, however, is important for popular explanation. In all other cases, the law of England appears to be as distinct as it is severe. It has even been decided that a child born before wedlock in a foreign country, and according to whose law such child was legitimate, could not inherit land in England where his bastardy was indelible.

There can be no collateral succession through bastards; for as they cannot be heirs themselves, so neither can they have any heirs but those of their own bodies. A bastard is not entitled to the name either of his reputed father or of that of his mother, though he may acquire for himself a surname by reputation; nor can he take property by the mere description of *child* of his reputed parent, until he has acquired the reputation of standing in that relation to him. Nor does a bastard follow, as legitimate children do, his father's place of parochial settlement under the poor-laws, but he has and follows the settlement of his mother until he attains the age of 16, or until he acquires a settlement in his own right, and after that age his primary settlement is in the parish where he was born. Another peculiarity of the status of bastardy is, that a bastard being *filius nullius*, the consent of his father or mother to his marriage is not required, and is of no avail; but a guardian may be appointed by the court of chancery for the purpose, or a license may be granted upon oath made that there is no person authorized to give consent. To this may be added, that although in general a father may by deed or will appoint a guardian for his infant child, in the event of his decease, he has no such privilege if the child be illegitimate.

Such may be stated to be the principal peculiarities attaching to bastardy in the law of England. In other respects, a bastard is very much in the same position as a legitimate person. Thus, he can hold land in fee-simple, and can dispose of it as he may think proper, making an unlimited alienation of it; and of course he can make a will bequeathing his whole estate; a simple and reasonable privilege, however, which, strange to say, was not conceded to bastards in Scotland dying without lawful issue, till the year 1836, when an act of parliament was passed, the 6 Will. IV. c. 22, which, on the preamble that "it was just, humane, and expedient," empowered bastards in that country to dispose of their personal property by testament or will in like manner as other persons might do, any law or practice to the contrary notwithstanding! In regard to his whole estate, although the crown is entitled to such in the case of a bastard dying intestate, the royal claim is not strictly enforced; but upon petition, the crown's right will be transferred to the nearest member of the deceased bastard's family. In the Scotch law, also, the crown may, by what is called a *gift of bastardy*, grant not only the personal, but the real estate of an intestate bastard to the "donatory," or person similarly entitled, as in the case of personal property in England. It is also to be observed, that the prohibitions as to marriage which extend to collaterals, and to those related by the half-blood only, also apply although one of the parties be a bastard. Again, the laws relative to incest apply to a bastard with equal force as to others; the principle of the two latter points being that, although the bastard be *filius nullius* as to many civil consequences, his relationship to his natural parent is recognized for moral purposes. Of course, it need not be added that a bastard may be made legitimate by an act of parliament for all purposes, even for that of inheriting land, "as was done," says Blackstone, "in the case of John of Gaunt's bastard children by a statute of Richard II."

The paternity of a bastard or illegitimate child in England is ascertained by several statutes—7 and 8 Vict. c. 101, 35 and 36 Vict. c. 65, 36 and 37 Vict. c. 9; and the father is bound to make a proper allowance for the child's support till 16. But it is on the mother herself that the maintenance of the child in the first instance devolves. She is for this purpose entitled to its custody in preference to its father; and she is bound to maintain it as part of her family while she remains unmarried, or until the child attains the age of 16, or gains a settlement in its own right, or (being a female) is married; and in the event of the mother's marriage, the same liability attaches to her husband. If the mother be of sufficient ability to maintain the bastard, while he is so dependent on her, and neglect that duty, so that he becomes chargable to a parish, she is liable, by 7 and 8 Vict. c. 101 s. 6, to be punished under the provisions of the *vagrant act*. Whether the mother is of sufficient ability or not, she can, by affiliation proceedings, compel the father to pay a sum not exceeding five shillings a week till the child is 16 (35 and 36 Vict. c. 65).

Besides the points in the Scotch law to which we have adverted, it is to be observed

that in that system, the maintenance, or "aliment," as it is called, of illegitimate children, is a joint burden upon both parents. The mother is entitled to the custody of the child, but it does not appear whether she is to have such custody for any fixed time. It is in the discretion of the court of session to determine this, and it would seem that the period may vary according to circumstances, from 7 to 14 years. During this time, the father is bound to contribute his proportion of the expense; and if neither the father nor the mother can support the child, it must be maintained by the parish in which the mother has a settlement.

There is a nice and curious difference in the laws of England and Scotland as to the mode of ascertaining the paternity of a bastard child. According to the statutes we have referred to, that fact may be proved in England by the evidence of the mother, provided her statement is supported in "some material particular" by other testimony. But in Scotland, the order of the inquiry is reversed; the woman's evidence in that country being taken *last*, and only where the other and independent evidence amounts to what is called a *semiplena probatio*—that is, such evidence as induces a reasonable belief, although not complete evidence, in which case she is admitted to give what is called her *oath in supplement*.

Both in England and Scotland, the widow of a bastard, whether there be issue or not of the marriage, is entitled to dower, terce, *jus relictæ*, and all the other legal rights of widows. See LEGITIMACY, SEPARATION, DIVORCE, MARRIAGE, INHERITANCE, FEE-SIMPLE, SUCCESSION, ULTIMUS HÆRES, VAGRANTS, and SEMIPLENA PROBATIO.

BASTARDY, GIFT OF. See under the preceding article.

BASTARDY, DECLARATOR OF. This is a suit which may be instituted in the court of session in Scotland, for having it declared that the lands or effects which belonged to the deceased bastard, belonged to the donatory in virtue of the gift from the crown. The "defender," or person against whom the suit is formally brought, is the party who would have succeeded to the bastard, had he been legitimate. B. can also be judicially declared by a similar mode of proceeding at the suit of a party who has any other interest, or, indeed, any interest whatever, to have such illegitimacy determined.

By a recent act of parliament, the 21 and 22 Vict. c. 93, the same conclusion may be substantially obtained by the English proceeding, directed by the act in the court for divorce and matrimonial causes. The act in question, it is declared, may be cited for all purposes, as the "legitimacy declaration act, 1858."

BASTI'A, the former capital of Corsica, is picturesquely situated on the slope of a mountain, rising from the sea in the form of an amphitheater, in the north-eastern part of the island, in lat. 42° 42′ n., and long. 9° 27′ east. It has (1872) 15,580 inhabitants. The streets are narrow and crooked. It has a harbor suitable for small vessels, defended by a mole, at the mouth of which is a rock resembling a lion couchant, and designated "Il Leone." There is a considerable trade in leather, skins, wine, oil, figs, and pulse; and many stilettos and daggers are manufactured here, which are principally exported to Italy. Until recently, the printing-presses of B. were actively employed in the production of Italian publications that would not have been permitted to appear in that country itself. B. was founded in 1380 by the Genoese Leonel Lomellino. During last century it was oftener than once taken by the British. It was made, in 1791, the capital of the French department of Corsica, which rank was afterwards transferred to Ajaccio. It is the seat of the highest courts of the island.

BASTIAN, HENRY CHARLTON, b. England, 1837; an eminent physician and physiologist. He was admitted to the royal college of surgeons in 1860; was assistant curator in the museum of university college, London, 1860–63; professor of pathological anatomy in the same college, 1867, and in 1871 physician to the university college hospital. He has published *The Modes of Origin of Lowest Organisms*, *The Beginnings of Life*, and many contributions to medical and philosophical journals. He is recognized as an authority in the pathology of the nervous system. He has carefully studied the modes of origin of the lowest forms of life, and is now foremost in the school of heterogenists, or believers in the theory of spontaneous generation.

BASTIAT, FRÉDÉRIC, an eminent political economist, was b. at Bayonne on the 29th of June, 1801. His father was a merchant, and educated his son with a view to the same profession. After completing his studies, B. entered the commercial house of one of his uncles, established at Bayonne, and employed his leisure hours in the study of political economy. Circumstances called him into Spain and Portugal in 1840, where he took advantage of the opportunity afforded him to study the customs and institutions of these two countries, which have still much to learn before they can be on a footing of equality with other nations in matters of finance and political economy. His first appearance as an author was in 1844, when he published, in the *Journal des Economistes*, an article "On the Influence of French and English Tariffs on the Respective Futures of the two Peoples." It contained in germ B.'s theory of political economy, who, from that moment, was a decided opponent of the system of protection. Subsequently, in the same journal, he combated the economic fallacies of socialism and the rights of labor. During a visit to England, he made the acquaintance of Cobden, and on his return to

France, he translated, 1845, the speeches of the free-traders, which he published with an introductory preface, entitled *Cobden and the League, or the English Agitation in Favor of Free Trade*, in which he gathered up into one solid mass the inconveniences of the protective system. B. now went to reside in Paris, where he continued to propagate his views with considerable success; he became secretary of the societies, and chief editor of the journal established to vindicate the principles of free trade. After the revolution of 1848, he was elected successively a member of the constituent and legislative assemblies. In 1850, he came forward as the antagonist of the socialist writer, Prudhon. Suffering from pulmonary disease, he repaired to Italy for change of climate, but died at Rome on the 24th Dec. 1850.

Besides the writings mentioned, B. published *Sophismes Economiques—Propriété et Loi, Justice et Fraternité—Protectionisme et Communisme, Harmonies Economiques*, and several other important tractates, all of which exhibit extensive knowledge of the subjects discussed, convincing logic, and a power of sprightly and biting satire. The *Harmonies Economiques* has been translated into English by P. J. Stirling (*Harmonies of Political Economy*, Murray, Lond. 1860). The soundness of the principles which the writings of B. uphold, notwithstanding the protectionist tendencies of the government, is now generally acknowledged in France.

BASTIDE, JULES, a French journalist and politician, minister of foreign affairs in 1848, and member of the constituent assembly, was born at Paris in 1800. In 1821, he became one of the first members of the French Carbonari; and after the July revolution, he was conspicuous among the writers of the radical opposition. On the reconstitution of the national guard, B. was elected commandant-in-chief of the legion of artillery, in which the republicans were grouped, and took part in the two insurrectionary movements, for the second of which—the *émeute* at Paris, 5th June, 1832—he was condemned to death, but escaped to London. Pardoned in 1834, he returned to Paris, and again devoted himself to politics in the columns of the *National*. B., however, being one of those Neo-catholic republicans who regarded the church of Rome as the religious synonym of democracy, could not heartily sympathize with the tone of that newspaper on religious topics, and in 1847 he founded the *Revue Nationale*, in which he advocated his peculiar opinions. During the revolution of 1848, he was a supporter of gen. Cavaignac, and an opponent of socialism. In 1858, he published *La République Française et l'Italie en* 1848; and in 1859 *Guerres de Religion en France*.

BASTILLE was, in France, a general term for a strong fortress, defended by towers or bastions (q.v.), and in this sense it was used in England also after the Norman conquest. The famous prison to which the name latterly was appropriated, was originally the castle of Paris, and was built by order of Charles V., between 1370 and 1383, by Hugo Aubriot, prévôt or provost of Paris, at the porte St. Antoine, as a defense against the English. Afterwards, when it came to be used as a state-prison, it was provided, during the 16th and 17th c., with vast bulwarks and ditches. On each of its longer sides the B. had four towers, of five stories each, over which there ran a gallery, which was armed with cannon. It was partly in these towers, and partly in cellars under the level of the ground, that the prisons were situated. The unfortunate inmates of these abodes were so effectually removed from the world without as often to be entirely forgotten, and in some cases it was found impossible to discover either their origin or the cause of their incarceration. The B. was capable of containing 70 to 80 prisoners, a number frequently reached during the reigns of Louis XIV. and Louis XV. Though small compared to the number which an ordinary prison contains, these numbers were considerable, when we reflect that they rarely consisted of persons of the lower ranks, or such as were guilty of actual crimes, but of those who were sacrificed to political despotism, court intrigue, ecclesiastical tyranny, or had fallen victims to family quarrels—and were lodged here in virtue of *lettres de cachet* (q.v.)—noblemen, authors, savans, priests, and publishers. On the 14th of July, 1789, the fortress was surrounded by an armed mob, which the reactionary policy of the court had driven into fury, and to the number of which every moment added. The garrison consisted of 82 old soldiers and 32 Swiss. The negotiations which were entered into with the governor led to no other result than the removal of the cannon pointed on the faubourg St. Antoine, which by no means contented the exasperated multitude. Some cut the chains of the first drawbridge, and a contest took place, in which one of the besieged and 150 of the people were killed, or severely wounded; but the arrival of a portion of the troops which had already joined the people with four field-pieces, turned the fortune of the conflict in favor of the besiegers. Delaunay, the governor—who had been prevented by one of his officers, when on the point of blowing the fortress into the air—permitted the second drawbridge to be lowered, and the people rushed in, killing Delaunay himself and several of his officers. The destruction of the B. commenced on the following day, amid the thunder of cannon, and the pealing of the Te Deum. This event, in itself apparently of no great moment, leading only to the release of three unknown prisoners—one of whom had been its tenant for thirty years—and four forgers, and in which it is said only the 654 persons whose names now appear on the column in the Place de la Bastille, took part, nevertheless finally broke the spirit of the court-party, and changed the current of events in France.

BASTINA'DO (from the Fr. *baston* or *bâton*, a cudgel), the name given by Europeans to the punishment in use over the whole east, which consists in blows with a stick, generally upon the soles of the feet, but sometimes upon the back.

BASTION, in fortification, is one of the principal defense-works in a fortified place. It is a kind of tower, very broad in relation to its height. The plain wall, called the *curtain*, which often surrounds a fortified town, is usually a polygon of many sides; and in that case, bastions occupy all, or nearly all, the salient angles. Bastions are mostly five-sided: the two outermost sides are the *faces*, meeting in an angle towards the enemy; the two on either side of these are the *flanks*, meeting two curtains or portions of wall; and the fifth side, open to the interior of the fortified place, is the *gorge*. Bastions may be regarded as projections, which enable the defenders to watch the approach of the enemy to the foot of the wall, and to frustrate them by a flanking fire. Taking the average range of modern ordnance and muskets as a basis, engineers decide on a distance of 300 to 400 yards between B. and B.; but if Armstrong or Napoleon guns, and Martini-Henry or Minié rifles, should hereafter be employed in attacking and defending fortified places, these figures will probably need modification. The length of each face and flank of a B. is so regulated, that two bastions can defend each other and the intermediate portion of wall. This principle was partly acted upon in the middle ages; but some of the Italian military engineers of the 16th c. first constructed the B. proper. The main substance of a B. is an immense mound of earth, capable of supporting heavy guns, and of receiving the fire of the enemy; but it is faced and strengthened in many parts with brick and stone. The top is broad enough to allow room for the large guns, and for infantry and artillery soldiers. A *hollow* B. has the space within it kept down to the level of the town or natural ground; but a *solid* B., filled up to the top with firm materials, is considered to be the best defensive construction. Vauban, the great French engineer, devised the plan of having large *detached* bastions opposite the chief angles of the place, with a ditch behind each: a tower or small B. being placed at the real angle of the wall behind. This was intended to enable the besieged to hold out for some time, even after the great bastions were taken.

The relation which bastions bear to the general system of attack and defense, is noticed under FORTIFICATION and SIEGE; while various details on the subject will be found under BATTERY, CASEMATE, CURTAIN, DITCH, EMBRASURE, ESCARP, PARAPET, RAMPART, etc. In woodcuts illustrating many of these articles, the relative position of the B. will be better shown than by any diagram in this place.

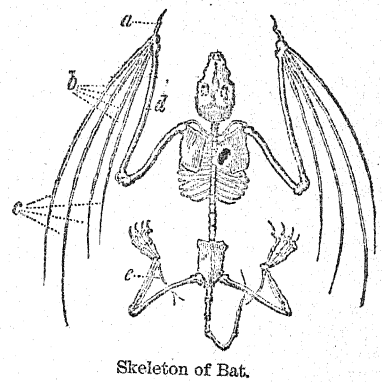
BASTROP, a co. in central Texas, intersected by the Colorado river and the Houston and Central Texas railroad; 880 sq.m.; pop. '70, 12,290—5233 colored; in '80, 17,135. The surface is undulating and fertile; corn and cotton are the principal crops. There is abundance of lignite coal. Co. seat, Bastrop.

BA'SYLE is the name given by chemists to a simple or compound substance which can unite with oxygen to produce a base (q.v.). Thus, all the metals are examples of simple basyles, and ammonium (NH_4), ethyle (C_2H_5), methyle (C_2H_3), etc., represent compound basyles. Another property which a B. possesses is, that it can unite with a salt radical (q.v.), like chlorine or cyanogen, to form salts. Thus, the B. sodium (Na) combines with chlorine to produce a salt—in fact, common salt (NaCl); and mercury (Hg) unites with cyanogen (Cy) to form the salt cyanide of mercury (HgCy).

BAT, the common name of all animals of the class *Mammalia* which are furnished with true wings, and so are capable of really flying or propelling themselves in the air. They were all included by Linnæus in the genus *vespertilio* (old Latin name), now subdivided and forming the family *vespertilionidæ*, which is very generally regarded as of precisely equal extent with the sub-order *cheiroptera* (Gr. hand-winged), although some naturalists still follow Cuvier in regarding the *galeopithecidæ* (colugos or flying lemurs) as another family of cheiroptera. But besides other characters which connect the colugos with lemurs rather than with bats, they greatly differ from bats in having a mere extension of the skin of the flanks attached to the limbs—as in the flying squirrels and petaurists or flying phalangers, and in the flying dragon among saurian reptiles—capable of sustaining them in the air like a parachute in a very extended leap, but not of being expanded and closed by a succession of strokes for true flight. The power of true flight, bats, on the contrary, possess; and some of them not only fly rapidly, but wheel about very nimbly in the air, in pursuit of their insect prey.

It is very interesting to compare the organs of flight in bats with those of birds, both as to the points in which they agree, and those in which they differ. They beat the air, as birds do, with their anterior members; but the requisite extension of surface is not obtained by quills, but by a great elongation of the arms and fingers, upon which a thin membrane is stretched, folding close to the body by means of their joints, when the wing is not in use. A little attention to the accompanying figures of the skeleton of a bat and of a bat flying, will make plainer than mere words can the relation of the bones of a bat's wing to the bones of the human arm and hand, or to the ordinary bones of the anterior extremities in quadrupeds which have fingers or toes. The thumb, *a* (in figure of skeleton), is short, armed with a strong nail, and not at all included in the wing-membrane, nor used in flight. The bones most elongated of all are the metacarpal bones, or bones of the hand, *b*; the true finger-bones, *c*, are not so much so. The fore-arm, *d*, has

not two bones (radius and ulna), but only one (the ulna), with a sort of rudiment of the other; the rotatory motion, of which these two bones afford the means, being not only unnecessary to bats, but at variance with the purpose chiefly designed in this part of their structure, of a powerful stroke in one particular direction. For a similar reason, "the fingers of this strange hand are incapable of closing towards the palm, as ours do, when grasping an object: their only movements are such as fold up the wing against the side of the body, by laying the fingers close along the side of the fore-arm, as in closing a fan." Great strength, however, was requisite in the shoulder; and, accordingly, we find an analogy to birds in the size and solidity of the bones in this part, as well as in the thickness of the muscles by which the wings are moved, and still more in the great dimensions of the sternum, or breast-bone, to which they are attached. The sternum is also furnished with a medial ridge, as in birds, for the better attachment of the muscles. The ribs are large; but the other bones generally, as those of the head and of the pelvis, are delicate, and appear designed for lightness.—The winged membrane of bats extends along the flanks to the hind-legs, although these aid little in flight; but it is attached to them so as to leave the feet free, which are much like the feet of ordinary small quadrupeds with toes and claws, and are employed along with the thumbs of the anterior limbs in creeping upon the ground, in climbing perpendicular rough surfaces, or for hanging with the head downward in that remarkable posture of repose in which bats pass great part of their lives, and in which they differ from all other animals.



Skeleton of Bat.

In the greater number of species of B., the wing-membrane extends not only to the hind-legs, but beyond them to the tail, which is included in it, a peculiar bone (*e* in fig. of skeleton) also arising from each heel to afford further support to this part of it, which seems to serve purposes analogous to the tail of birds, acting as a rudder, and enabling the animal to make those rapid evolutions in the air, which it is so pleasing to see as bats flit about in the summer evening. The fruit-eating bats of tropical regions, which have no need to perform such evolutions, are destitute of this interfemoral part of the membrane; and according to the habits for which each species has been designed, the tails are long or short, entirely included in the membrane, or only for part of their length, or produced a very little beyond it, and terminating in a hard tip, so that the tail is capable of being used to aid in creeping or climbing, evidently possessing considerable power, and being curved and moved in a manner which suggests a slight analogy to the prehensile tails of monkeys.

Bats were placed by Linnæus in his order *primates*, along with monkeys and lemurs, with which they agree in their pectoral teats and in other characters, particularly of the organs of reproduction. In one genus (*dysopus*), there is an additional resemblance to the primates in the partially opposable thumbs of the hind-feet, and a trace of this character is to be found in the fore-thumbs already noticed. Bats are now, however, generally placed by naturalists in the order *feræ* or *carnaria*, although, like many other animals of that great order, most of them are by no means exclusively carnivorous. The greater part of them feed chiefly on insects, some chiefly on fruits. They exhibit considerable variety both in the number and character of their teeth, as might be expected in animals which differ so much in their food. All of them have four rather large canine teeth; the incisors vary much in size and form, as well as in number. The digestive apparatus exhibits a variety corresponding with that of the teeth; the intestinal canal of the vampires (q.v.), which live by sucking the blood of animals, proceeding almost in a straight line from one extremity of the body to the other, whilst that of some of the frugivorous bats, as the kalong (q.v.) (*pteropus*) of Java, is seven times as long as the body.

Except in the power of flight and things essential to it, bats present no resemblance to birds. The old English name *flittermouse*, and the German *fledermaus*, indicate an early popular recognition of their true place in creation. They are generally nocturnal animals, or, at least, prefer the twilight, although one of the British species may occasionally be seen pursuing insects during winter at midday. They generally spend the day in caves, hollow trees, and other dark recesses, often under roofs of houses, and in crannies of ruined or deserted buildings. They are found in almost all parts of the world, except the very coldest, but are most numerous and of greatest size within the tropics. Those of temperate climates generally spend the winter in a state of torpidity, in which, although circulation continues very languidly, respiration does not ordinarily take place. The whole number known to Linnæus amounted to a very few species, not half so many as are now known to inhabit Great Britain alone. Upwards of 130 species have been described, and there is great probability that the actual number existing is

very much greater. It is not unlikely that some exaggerated accounts of the great bats of warm climates gave rise to the fable of the Harpies, which Virgil introduced into the *Æneid*. The bats of Europe are all small; the body of the largest British one is not so large as a mouse, and the fullest stretch of its wings about 15 in., whilst the common British species are much smaller; but in the kalong, already mentioned, the stretch of wing is 5 feet. Of British species, the largest is the noctule B. (*vespertilio noctula*), a very local species, found chiefly in the s. of England; the pipistrelle B. (*V. pipistrellus*) is perhaps the most common. It was long confounded by British naturalists with the common B. of the continent of Europe (*V. murinus*), which is much larger and very rare in Britain. In some parts of the country, the long-eared B. (*plecotus auritus*) is very common. It is distinguished by its enormously large and very beautiful ears, which, when it is asleep, are folded up in a remarkable manner under the arm, the long *tragus* then resembling a slender ear. This great development of the ears is characteristic of certain genera of B., that part of the ear called the *tragus* attaining also a remarkable size, so that it seems like a smaller ear in front of each large one. In many species, only two of which are found in Britain, there is a still more remarkable membranous or leaf-like appendage on the nose, which in some is simple, in some complex, and often of large size, giving an extraordinary appearance to the face. Some of the larger species, having a nasal crest, are called specter bats (q.v.). Only two species of B. (*rhinolophus*), possessing such an appendage, are found in Britain, both of them very rare; from the form which it assumes, they are called horseshoe bats. It is supposed that this nasal appendage is of use as a very delicate organ of touch, perhaps also of smell; as the great ears may be of use both for touch and hearing. These senses must often guide bats when that of sight cannot be employed; and the sense of touch appears to be possessed in no ordinary degree even by the winged membrane. By supposing it to be affected by the pulsations of the air, Cuvier accounted for the power displayed by bats which had been cruelly deprived of sight, of avoiding objects amongst which they flew, without the necessity of ascribing to them, as Spallanzani had done, the possession of a sixth sense.

It deserves to be here noticed that amongst the peculiarities which distinguish certain genera of bats, is the absence not only of the upper cutting teeth in the East Indian and African genius *megaderma*, but even of the bone in which these teeth are usually placed; and that another tropical genius, *nycteris*, of which the species are found in Africa and Java, have the skin attached to the body only at a few points, and capable of being blown up like a bladder, at the pleasure of the animal, by means of air, which is inhaled through the nostrils into cheek-pouches communicating by small apertures with the general skin-bag. The use of this is wholly unknown.

Bats walk or creep awkwardly upon the ground, one side of the body being jerked forward, and then the other, yet they run with considerable celerity. There is a common notion that they cannot rise easily from a level surface, but must find some eminence from which to throw themselves. Of the fallacy of this, any one will soon be convinced who gets a B. and places it upon the floor.—Bats commonly produce one or two young at a birth.—Some of the species are very gregarious; others often fly about in pairs; great numbers, and of different species, are often found congregated in their places of hybernation or repose.—Some of the species are easily tamed, and become very familiar; but their odor is disagreeable, and it is generally found difficult to keep them long alive.

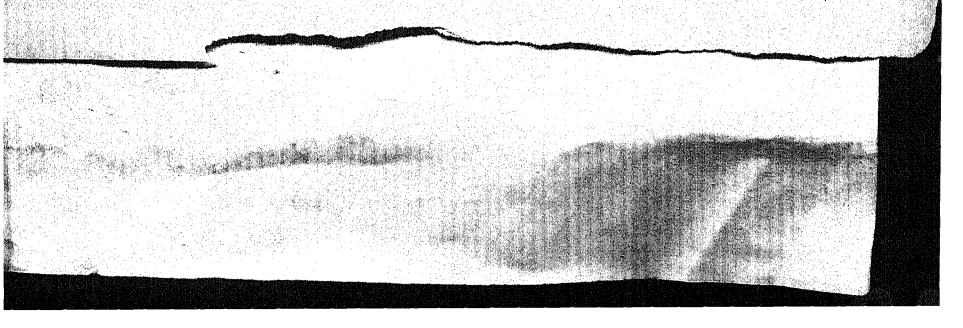
Fossil remains of *cheiroptera* are occasionally found in eocene rocks, but owing to the delicacy of the bones, great difficulty has been experienced in the determination of the genera and species.

BAT, or BÂT (Fr.) in military matters, was originally the name of a kind of pack-saddle; and hence a bat-horse was a baggage-horse bearing a bat or pack, and a bat-man was a servant in charge of the horse and bat. By a modification of meaning, a bat-man is now any soldier allowed to act as servant to an officer. When British troops are sent on foreign service, bat-horses or mules are provided (if carriages are not forthcoming) for carrying the regimental books, the kettles, and tents, the medicine-chest, the veterinary medicine-chest, intrenching tools, armorers' stores, saddlers' stores, etc.—about 20 such horses or mules to each battalion. Bat-horses and bat-men are also provided for carrying officers' camp-equipage. An allowance for procuring these accommodations is usually called bat-money.

BATAK. See BATTAS, *ante*.

BATAN'GAS, a seaport t. of the Philippines, island of Luzon, and capital of the province of the same name. Lat. 13° 45′ n., long. 121° 5′ east. Distance from Manilla, 50 m. s.; founded 1581. Pop. of town and district, 17,000. B., which is well built, and has an elegant appearance, is finely situated on an extensive bay which opens into the strait of Mindoro. Considerable advantage is taken of its facilities for commerce.

BATARDEAU', a strong wall of masonry, built across the outer ditch of a fortress, to sustain the pressure of water when one part of the ditch is dry and the rest wet. It is built up to an angle at the top, and is armed with spikes, to prevent the enemy from crossing; and sometimes a stone tower is provided to strengthen the defense. There is a sluice-gate to regulate the admission of water.



BATA'TAS, or SWEET POTATO (*Convolvulus batatas*, or *batatas edulis*, the genus *batatas* having recently been separated from *convolvulus* (q.v.), chiefly upon account of the four-celled ovary), a perennial plant with long creeping stems, heart-shaped leaves on long stalks, and variously lobed, large purple flowers much resembling those of the best known species of convolvulus, and very large oblong acuminated tubers. It is a native of the East Indies, but is now cultivated in all tropical and sub-tropical countries for its tubers, which are highly esteemed as an article of food, and are eaten either roasted or boiled; they are sweet, wholesome, and nutritious, but somewhat laxative. The B. forms, next to maize, the principal food of the poorer classes in some parts of America. Its cultivation is very easy; it is readily propagated by tubers or by cuttings of the stem, requires little attention, and soon produces its tubers. In hot-houses in Britain, these are without difficulty obtained at 1 lb. or 2 lbs. weight. The cultivation of the B. has been introduced into the s. of Europe. In America, it is little cultivated to the n. of New Jersey, and even there is inferior. The leaves are used as a boiled vegetable. It is the B., or sweet potato, which is usually meant by the older English writers, when they mention potatoes. Its tubers were imported into England by way of Spain, and sold as a delicacy, before the potato was known—*batatas paniculata*, or *convolvulus paniculatus*, a nearly allied species, is cultivated in the same way as the common B., and its tubers are similar in quality.—To the new genus *batatas*, has been referred also the plant formerly known as *ipomœa macrorhiza*, now *batatas jalapa*, so called from supposed purgative qualities of the root, which, however, it is found not to possess, being white, insipid, saccharine, and farinaceous, and of great size, 50 to 60 lbs. in weight. The plant inhabits sandy soils in Georgia and Carolina.

BATA'VI (or, according to some MSS., VATAVI), the name of a German people, who anciently inhabited a part of the present Holland, particularly the island which was called after them, Batavia, formed by the branch of the Rhine which falls into the sea at Leyden, the Waal, and the Meuse. Their country, however, extended across the Waal, but its boundaries cannot now be precisely determined. According to Tacitus they were originally a branch of the Chatti, who emigrated across the Rhine. They were conquered by Germanicus; became subject to the Romans, and served them so well, that they obtained the honorary title of friends and brothers of the Roman people; were exempted from taxes and assessments, being only required to provide a proportion of troops; and were permitted to choose their commanders from amongst themselves. Their cavalry were particularly good, and were often employed by the Romans. The first who terms the insular district inhabited by these Gauls, Batavia, is Zosimus, who also informs us that in the time of Constantius (358 A.D.) it had fallen into the hands of the Salii, a Frankish tribe.

BATA'VIA, properly the name of the island occupied by the ancient Batavi, became at a later date the Latin name for Holland and the whole kingdom of the Netherlands. The name BATAVIAN REPUBLIC was given to the Netherlands on their new organization of 16th May, 1795, and they continued to bear it till they were converted into the kingdom of Holland, under Louis Bonaparte, 5th June, 1806.

BATA'VIA, the capital of the empire of the Netherlands in the East Indies, stands on the n.w. coast of Java, at the mouth of the Tjiliwong, frequently called the Jaccatra, from the former native town, on the ruins of which the present city was built. There is good anchorage for large ships in the offing, and it is navigable for smaller vessels towards the interior. The influence of a vertical sun on this Holland in miniature led it to become proverbial as the grave of Europeans. Latterly, however, the climate has been greatly improved by draining. The temperature, though not extreme, is oppressive from its uniformity, the mean of winter being 78.1° F., and that of summer only 78.6°. The lat. is 6° 7′ 40″ s., and the long. 106° 52′ east. Pop. 65,000. Notwithstanding the growing prosperity of Singapore, B. continues to be the commercial emporium of the far east. Its markets present at once all the productions of Asia, and all the manufactures of Europe. In 1811, while Holland was under France, B. was taken by the English, but was restored to its former owners in 1816. Latterly, B. has found Singapore a formidable competitor for the trade between east and west. The Dutch government has laid a telegraphic cable of 600 m. from B. to Singapore. There is a railway from B. to Buitenzorg, 36 miles.

The province of B. is low, but rises gently towards the south. The forests have all been cut down for the use of the sugar factories. It is well adapted for fruit-trees and vegetables, which are cultivated by Chinese gardeners. B., including Buitenzorg, had a pop. (1st Jan., 1874) of 983,868, consisting of 6081 Europeans, 69,397 Chinese, 907,426 natives, and 964 other orientals. The peculiar character of the people has been lost by the influx of and intermarriage with strangers from all districts of the Indian archipelago. The language is a mixture of Sundanese, Malay, and other tongues, and is called low Malay. The largest estates are held by Europeans, the smaller by Chinese and natives. The religion is chiefly Mohammedan. There are good post-roads and some canals. The industries continue to increase, and chiefly consist of factories for making machinery for distilling and for sugar works; distilling arrack, copper and tin work, dyeing, etc. The nutmeg, cacao, and cocoanut tree are successfully grown. The stock consists of buffaloes, horses, and cattle.

BATA'VIA, a village and township in Kane co., Ill., 39 m. w. of Chicago, with which it is connected by the Chicago, Burlington and Quincy, and the Chicago and Northwestern railroads; pop. '70, 3018. It has a private insane asylum, manufactories, and valuable quarries.

BATA'VIA, a village and seat of justice of Genesee co., N. Y., 36 m. e. of Buffalo; with railroad connections to all points; pop. of village and township '75, 7067. It has the state institution for the blind, a ladies' seminary, a library, and several manufactories.

BATCHIAN, or BATJAN. See BATSHIAN, *ante*.

BATEMAN, KATE JOSEPHINE, an American actress, b. Maryland, 1843. With her sister Ellen she appeared on the stage almost in infancy, and exhibited unusual talent. In 1861, she began her adult career in New York in *Julia*, *Pauline*, *Juliet*, etc., and in the next year made a remarkable success in *Leah*. She played in several American cities and then in England, having the management of a theater in London, and accumulating fame and fortune. In 1866, she became the wife of George Crowe, an English physician.

BA'TENBURG, a t. of the Netherlands, in the province of Gelderland, situated on the right bank of the Maas, 9 m. w. of Nymegen. It is worthy of notice only on account of its association with the Romans, whose *oppidum batavorum* it was.

BATES, a co. in w. Missouri, on the Kansas border; traversed by the Missouri, Kansas, and Texas railroad, and intersected by Osage river; 900 sq.m.; pop. '70, 15,960 —320 colored; in '80, 25,080. It is a prairie region, producing grain, tobacco, and cattle. There are beds of coal and carboniferous limestone, and plenty of timber. Co. seat, Butler.

BATES, BARNABAS, 1785–1853; b. England; advocate of cheap postage in the United States; Baptist minister in Rhode Island; established the *Christian Inquirer* in New York, and while assistant in the post-office there, he became interested in the reduction of postage. After many years of writing and speaking, his object was achieved in respect to land postage.

BATES, EDWARD, LL.D., 1793–1869; b. Virginia; an early settler and lawyer in Missouri, member of the legislature, of the constitutional convention, and representative in congress. He was an unsuccessful candidate for president in the convention that nominated Lincoln in 1860, and was attorney-gen. in Lincoln's first cabinet.

BATES, JOSHUA, 1788–1864; an English banker, b. in Massachusetts. He established a house in London in connection with John Baring, son of sir Thomas Baring, and subsequently went into the firm of Baring Brothers. He gave $50,000 towards founding the Boston public library. His only child is Madame Van de Weyer, the wife of a Belgian diplomatist.

BATES, WILLIAM, D.D., 1625–99; an English non-conformist divine, one of the commissioners for reviewing the public liturgy, and one of those concerned in drawing up the exceptions to the book of common prayer. He was appointed chaplain to Charles II., and became minister of St. Dustan's, but was deprived of his benefice for non-conformity. He published in Latin, *Select Lives of Illustrious and Pious Persons;* other works appeared after his death.

BATH, the chief city in Somersetshire, England, is beautifully situated in a wooded valley in the n.e. part of the co., on the Avon, 20 m. from its mouth, and 106 m. s.w. of London. The houses are built wholly of white freestone—"bathoolite," worked in the neighboring quarries—bricks being entirely discarded. The city has a finer appearance than any other in England, the variety of level giving very commanding sites for its fine and regular streets, crescents, and public buildings. The beauty and sheltered character of its situation, the mildness of its climate, and especially the curative efficacy of its hot chalybeate springs, have long rendered B. a favorite fashionable resort. The springs, which are four in number, were known to the Romans, who built baths on the spot in the 1st c., of which extensive remains were discovered in 1775. The temperature of the springs varies from 97° to 117° F.; they rise near the river bank, in the center of the city, and discharge 184,320 gallons of water daily. The water is most useful in bilious, nervous, and scrofulous complaints, palsy, rheumatism, gout, and cutaneous diseases. Though the gayety of B. has greatly waned since the days of the prince regent, there has been a great general improvement in the city, but the pop somewhat diminished during the twenty years 1851–71. It has two parks, and many public walks and open places; theater, concert-rooms, and other places of amusement; subscription library, museum, club-house, educational institutions, etc. The abbey church is a cruciform structure in the latest perpendicular style, with a fine roof in the style of Henry VII.'s chapel, and a central tower 150 ft. high. About a mile to the n.w. is Beckford's tower, built by the eccentric author of *Vathek*, but now a cemetery chapel. It is 154 ft. high. B. returns two members to parliament. Pop. '71, 53,704, at times much increased by visitors. B. has no manufactures of any note. Coal is found in the neighborhood. The Great Western railway from London to the w. passes through the city. B. is of great antiquity; it was a Roman station called *Aquæ Solis*, at the inter-

section of the great Roman ways from London to Wales, and from Lincoln to the s. coast of England. Richard I. granted B. its earliest extant charter, which was subsequently confirmed by Henry III. and greatly extended by George III. A greater number of Roman remains have been found in and near B. than elsewhere in Britain; they form a collection unrivaled in extent and value.

BATH, KNIGHTS OF THE. The name of this order is derived from the ceremony of bathing, which used to be practiced at the inauguration of a knight, as an emblem of the purity henceforth required of him by the laws of chivalry. The ceremony is of unknown antiquity, and is spoken of by writers of the 13th c. as an ancient custom. See KNIGHT. The earliest authentic instance of its observance which we have in this country, is in the time of Henry IV., who, in preparing for his coronation, made forty-six knights at the tower of London, who had watched all the night before, and bathed themselves. The last knights of the B. created in the ancient form were at the coronation of Charles II. in 1661. From that period till the accession of the house of Hanover, the order fell into oblivion. It was revived by George I. in 1725, and is now the second order in rank in England, the first being the Garter. By the statutes then framed for the government of the order, it was declared that, besides the sovereign, a prince of the blood, and a great master, there should be thirty-five knights. At the conclusion of the great war, it was thought expedient, with a view to rewarding the merits of many distinguished officers, both military and naval, to extend the limits of the order, which was effected on the 2d Jan., 1815. But the order was still purely military, and it was not till 1847 that it was placed on its present footing by the admission of civil knights, commanders, and companions. The following is its present organization.

First Class.—Knights grand cross (K.G.C.); the number not to exceed, for the military service, 50, exclusive of the royal family and foreigners; and for the civil service, 25.

Second Class.—Knights commanders (K.C.B.); military, 102, and civil, 50, exclusive of foreigners. These, like the first, have the title *sir*, and take precedence of knights bachelors.

Third Class.—Companions (C.B.); military, 525, and civil, 200. They take precedence of esquires, but are not entitled to the distinctive appellation of knighthood. No officer can be nominated to the military division of this class unless his name has been mentioned in the *London Gazette* for distinguished services in action; and the order has never been conferred on an officer below the rank of a major, or commander in the navy.

BATH, a co. in n.e. Kentucky, on the Licking river; 220 sq.m.; pop. '80, 1,982—2,014 colored. It has abundance of iron and coal, and several medicinal springs, and produces cereals and wool. Co. seat, Owingsville.

BATH, a co. in Virginia in the Alleghanies, on the West Virginia border; 725 sq.m.; pop. '70, 3795—889 colored. Its surface is hilly, with fertile valleys, producing wheat, corn, oats, and cattle, and there are medicinal springs of value. Co. seat, Warm Springs.

BATH, a city and port of entry in Maine, on the Kennebec, 4 m. below the junction with the Androscoggin, 12 m. from the sea and 35 m. s. of Augusta; the seat of justice of Sagadahoc co.; pop. '70, 7371. Ship-building is the main business, in which it ranks next after Baltimore. The harbor is never frozen, and being easily accessible it renders B. an important commercial place. It was incorporated as a town in 1780, and as a city in 1850. There is ample railroad connection in all directions.

BATH, a village in Steuben co., N. Y., 74 m. s.s.e. of Rochester on Conhocton creek; pop. of township, '75, 6704; in '80, 6779. It is the co. seat, and has an orphan asylum, court-house, and the New York state soldiers' home.

BATH, EARL OF. See PULTENEY, WILLIAM.

BATH—BATHING. By bathing is usually understood the immersion of the body, or a part of it, in water. In a more extended signification, it means the surrounding of the body with any medium differing in nature or temperture from its usual medium; thus, we speak of a blood-bath, a vapor-bath, a cold-air bath, a compressed-air bath (q.v.), an earth-bath. A fourfold division may be made of baths: 1. According to the substance with which the body is surrounded—into water, oil, milk, gas, sand, and other baths; 2. According to the manner of application—into river, slipper, plunge, shower, dropping, vapor, and douche baths; 3. According to the parts of the body subjected to the application—into whole, half, sitz, foot, hand, and eye baths; and 4. According to the temperature of the substance applied—into cold, tepid, warm, and hot baths.

The practice of bathing undoubtedly reaches back to the earliest times in the existence of the human race, and the most ancient historical accounts as well as popular myths make mention of it. Among the Egyptians, the bath was practiced as a religious rite; and, in general, we find the opinion prevailing throughout antiquity, that purification of the body induced or signified moral purity. Man, it was thought, ought to present himself pure in body and soul, when he engaged in the service of his god, or in any transaction that brought him into immediate contact with that being. In making the bath a religious ordinance, Moses may have had in view the prevention or more

speedy cure of those skin-diseases so prevalent in the east. The Mosaic law prescribes expressly, in some cases, the use of running water, which has given rise, through a misunderstanding, to the deleterious cellar-baths of the Jews. In Palestine, the wealthier Jews had private baths in their houses, and ponds in their gardens, an arrangement which prevailed in all the civilized parts of the east, and which does so still. There were, besides, public bath-houses among the Jews, as among other nations. Among the Greeks, also, bathing was very early in use. The practice is often alluded to in Homer. Bathing among the Greeks, as among other nations, was counted a religious rite, and was connected with the preparations for sacrifice, for the reception of oracles, for marriage, etc. We possess, however, no detailed accounts of the construction and arrangements either of private or of public baths in Greece, which last were mostly connected with the gymnasia. The men bathed together; that there were public baths for women, appears probable from various indications.

Among the Romans, although warm-baths (*thermæ*) were in use from the earliest times, yet it was only at a late period that they were so extensively adopted; and then the increased and universal spread of luxury had driven the primitive object of bathing into the background, so that the public baths were looked upon as places of general resort for pleasure. The most of these public baths were built under the emperors. They were numerous in Rome and in the provincial cities. Their construction may be gathered from their numerous remains, and from the description of them given by Roman writers; they resembled the Turkish and Russian baths.

The essential parts of a Roman bath were as follows: 1. The *hypocaust*, or stove, in the basement-story, for heating both the bath-rooms and the water. The water was contained in three receptacles or boilers, so arranged that the undermost, immediately over the fire, contained the hot water; the one in the middle, the tepid water; and the uppermost, the cold water. These vessels were so connected by pipes, both with the bath-rooms and with one another, that the hot water that flowed from the lowest boiler was replaced by tepid water from the one above; and that, again, by cold from the uppermost.—2. The *apodyterium*, or room for undressing.—3. The *frigidarium*, a room with a basin for cold bathing.—4. The *tepidarium*, the purpose of which cannot be exactly determined, but which seems to have been intended for bathing in tepid water, and also for allowing the body to cool down in a mild temperature.—5. The *caldarium*, in which sometimes the *sudatio*, or sweating-bath, and sometimes the real hot-water bath, were taken. This room had hollow walls, and the floor rested on low pillars over the hypocaust, so that it was surrounded on all sides with heated air. The *laconicum*, which is spoken of as a part of the caldarium, was probably a kind of stove that was heated from the hypocaust, and contributed to raise the temperature. In the bath-rooms there were basins (*alvei*) for holding the water, and round the walls were benches or seats, which, in the caldarium, were raised as in an amphitheater, in order to give the bathers the choice of the higher temperature of the upper part of the room, or of the more moderate of the lower. The caldarium contained also a *labrum* or vase of several feet diameter, filled with cold water, into which the bathers dipped after the hot bath. With these essential parts of a bath, there were usually connected an *unctuarium* or *elæothesium*—i.e., an anointing-room, and often gardens, covered walks, rooms for games, etc.

The processs of bathing was this: After undressing in the apodyterium, the bather was anointed in the elæothesium with a cheap coarse oil, and then proceeded to a spacious apartment devoted to exercises of various kinds, among which games at ball held a prominent place (hence the hall was called *sphæristerium*). After exercise, he went into the caldarium, either merely to sweat or to take the hot bath; and during this part of the process, the body was scraped with instruments called *strigiles*. Being now dried with cloths, and slightly anointed all over with perfumed oils, he resumed his dress, and then passed a short time successively in the tepidarium and the frigidarium, which softened the transition from the great heat of the caldarium into the open air.

The public baths for women were of similar construction, and were much frequented even by the most respectable. The women bathed in company, like the men. The irregularity of men and women bathing together is also alluded to by ancient writers; and in later times, the baths in general became the scenes of all sorts of debauchery, as was the case at Baiæ.

The most remarkable remains of Roman baths are those of the baths of Titus, of Caracalla, and of Diocletian in Rome, and the recently excavated thermæ at Pompeii: remains of the kind are also to be found in Germany, France, and England. The extent and magnificence of those edifices it is difficult for us now to conceive. Speaking of the baths of Caracalla, Mr. Fergusson, in his *Hand-book of Architecture*, says: "St. George's hall, at Liverpool, is the most exact copy, in modern times, of a part of these baths. The hall itself is a reproduction, both in scale and design, of the central hall of Caracalla's baths, but improved in detail and design, having five bays instead of only three. With the two courts at each end, it makes up a suite of apartments very similar to those found in the Roman examples. The whole building, however, is less than one fourth of the size of the central mass of a Roman bath, and therefore gives but little idea of the magnificence of the whole."

The ancient Germans seem, according to Tacitus and other writers, to have been

fondest of the cold river-bath. When Roman luxury was driven out by German-habits, and the n. of Europe got the upper-hand of the s., baths ceased to be of public importance, and amid the tempestuous irruptions and fluctuations of the different nations, those splendid edifices fell into ruins. Christianity, however, by the institution of baptism, had preserved for the bath its religious signification; and in the middle ages, among the ceremonies preceding the solemnity of conferring the honor of knighthood, the bath was held essential. The Arabians and the Mohammedans generally had more completely adopted bathing into their manners and customs. Islam enjoins on the believer the careful preservation of corporal purity; and for this purpose, prescribes repeated daily ablutions. Besides these, certain circumstances and times make the use of the B. ritually obligatory on both men and women. For this end, not only did the rich erect splendid baths in their houses and gardens, but bath-houses for the people in general were established in every town in which there was a mosque. The public baths of the Turks of the present day are a copy of those ancient Arabian baths. The construction of those oriental baths, imitations of which are now to be found in some European cities, is as follows: The building is of stone, the bath-rooms have a floor of marble, which is heated from below, and tubes in the walls conduct the heat in all directions. The bather undresses, wraps himself in a blanket, puts on wooden slippers, to protect him from the heat of the floor, and enters the bath-room. Here a general perspiration soon breaks through the skin, which is washed off with cold water. The body is then rubbed with woolen cloths, and smeared with a soap or salve beneficial to the skin. This is generally accompanied by the operation of "kneading." The bath-attendant stretches the bather on a table, pours warm water over him, and then begins to press, squeeze, and twist his whole body with wonderful dexterity. Every limb is straightened and stretched, and when he has finished one side, he begins on the other. He kneels upon the bather; he seizes him by the shoulders, makes his backbone crack, and every vertebra quiver, or applies soft blows to the fleshy parts. He then takes a hair-cloth, and rubs the whole body, rubs off the hard skin of the feet with pumice-stone, anoints the bather with soap and perfumes, and finishes by cutting his hair and beard. This treatment lasts some three quarters of an hour; and the feeling after it is as of being born anew. An inexpressibly delicious sensation of comfort pervades the body, and soon ends in a sweet sleep. After bathing, people repose in a cooler room, stretched on couches, and finally partake of coffee, sherbet, or lemonade.

In England, France, and Germany, public establishments for bathing were long unknown. It was during the crusades, which brought the east and west into contact, that Europeans first became acquainted with the baths of the Asiatics; and the want of such institutions came to be more sensibly felt from the leprosy and other skin-diseases which intercourse with Asia introduced into western Europe. The evil was at first sought to be met by establishing hospitals; but as these were found insufficient, baths and bath-rooms were erected, which gradually became public establishments.

Besides the kinds of baths already described, there are now to be found in the larger cities of Europe, generally in connection with water-baths, imitations of the vapor-baths which have been long in common use in Russia. The Russian bath consists of a small apartment built of wood, with broad benches running round it, on which the people lie undressed. By throwing water upon glowing hot pebbles, a dense hot steam is produced, which envelops the bathers, and throws them into such a heat, that the perspiration breaks out over the whole body. In this atmosphere of steam, the thermometer often rises to 112°–140° F. After they have sweated for some time, and from time to time cooled themselves again, by having cold water poured over them, the skin is rubbed with soap, and with towels made of inner bark, or with brushes; they are flogged with softened birch-twigs, and then washed with tepid, and afterwards with cold water; and at last have cold water dashed over them. A bather will also go direct from the sweating-bath, and plunge into a river or a pond, or roll himself in the snow. These baths are a necessary of life in Russia, and are to be found in every village. The German vapor-bath differs in this, that the steam is produced in a boiler, and that the bather remains for some time in an adjoining room of moderate temperature, wrapped in blankets, to allow the perspiration to go on, and the blood to become calm. A ruder kind of sweating-bath, in a hole in the earth, or in a baking-oven, is practiced among many nations; among the Finns, the natives of Mexico and South America, etc.

As regards detergence, the vapor-bath is the only kind of bath that is really effectual. Seated naked in a room filled with hot vapor (which produces no inconvenience in breathing), the scurf, which, notwithstanding all sorts of previous ablutions, has accumulated on the skin, is gradually softened and loosened, and is rubbed off in a surprising manner by the hands of the bath-man who is in attendance at these establishments. As in the Turkish bath, the person is cooled down by being dashed with tepid and cold water. After this kind of bathing, the sensation is exceedingly agreeable. The process just mentioned may be said to resemble that in use by the Romans; the hands of the operator having much the same effect as the *strigiles* of the ancients. Few of the ordinary bathing establishments in Great Britain have vapor-baths, at least not on a proper footing; and the great value of this species of bath as a purifier of the skin is little known.

Bathing is a very important agent in the preservation and restoration of health. Besides promoting cleanliness, the refreshing and invigorating effects of cold bathing in

its various forms have always been more or less understood, as have also the soothing effects of the warm bath. But the virtues of water as a curative agent have been more fully developed in modern times, since the rise of the system of therapeutics known as the water-cure or hydropathy. With that exaggeration which is incident to everything new, the first promoters of this system gave it out as a panacea "for all the ills that flesh is heir to." But now that these quackish pretensions are all but universally given up, it is very generally admitted that water is capable of a large range of effects, some of them apparently of the most opposite kinds; while the mode of action is nothing mysterious, but capable of explanation on the recognized principles of physiology. The fuller exposition of this part of the subject will be more conveniently considered under HYDROPATHY.

A MEDICATED BATH is one in which some substance, intended to act as a medicine, has been mixed with the liquid. This is one of the most important methods known to medical art of bringing remedies to bear upon the system. The skin is by no means impervious to foreign substances; and no other organ presents at once so large a surface to the matter to be imbibed; at times, also, the other channels by which remedies are introduced into the body cannot be used. Baths of this kind are partly imitations of natural mineral waters, and partly other remedial mixtures. The mineral substances used are common salt, chloride of lime, nitric acid, corrosive sublimate, potash or soda caustic or carbonated, ashes, soap, iodine, sulphur, iron, etc.; the vegetable are wine, vinegar, solutions of essential-oils, infusions of thyme, rosemary, lavender, wormwood, willow, oak, and Peruvian bark, etc.; such animal substances as milk, blood, bouillon of meat, etc., are also sometimes employed as baths, with a view to impart nourishment, but whether much is taken up into the system, is doubtful. In the case, also, of vapor-baths, medicaments are added to the water with good effect; these must, of course, be volatile. If the whole body is to be immersed in the vapor, nothing must be used that might injure the organs of respiration; when the application is partial, and by a special apparatus, this precaution is less necessary. In connection with this may be mentioned the so-called SMOKE-BATHS, or medicated fumigations, in which the whole body, with exception, of course, of the head, or particular parts of it, are brought in contact with the vapors of dry medicinal substances. Resinous aromatic substances, incense, myrrh, benzoin, amber, sulphur, cinnabar, and mercury are used for this purpose. The application must be made in what is called a fumigating-box, in which the particular part of the body alone is inclosed along with the vapor, in order that the respiratory organs may not be incommoded. The utmost precaution is requisite with the vapors of sulphur and mercury, as they are apt to occasion serious accidents.

Another species of vapor-bath is what is called an ANIMAL BATH, which was known to the ancients, and was in great reputation in cases of lameness. Either the whole body of the patient is wrapped in the skin of a newly slaughtered animal, or an opening is made, and the diseased limb inserted into the breast or belly of the animal while yet alive, or into the newly drawn blood. Sometimes smaller animals are killed, split up, and immediately applied to the diseased part.

Of GAS BATHS, the most generally used are those of sulphuretted hydrogen and carbonic-acid gas, which are to be had at certain mineral springs. The first, mixed in small quantity with atmospheric air, lowers the irritability of the air-tubes, and affords relief in many diseases of the respiratory organs. A stronger mixture of it, brought in contact with the outer surface, is of use in disorders arising from depression of the functions of the skin. Carbonic-acid gas gives a gentle stimulus to the skin, promotes menstruation, and is much used in many places in the form of half-baths. In recent times, at Ischl and other places, the vapors that arise from the mineral springs loaded with saline particles, are received in close rooms, in which the patients walk about, and allow the vapors to act upon the lungs and skin.

The terms *water-bath* and *sand-bath* have been adopted in chemistry, to signify a contrivance by which vessels that are to be heated to a certain temperature are not brought into immediate contact with the fire, but receive their heat through the medium of hot sand or water, so that the heating takes place uniformly, and overheating is avoided

BATHGATE, a t. in the center of Linlithgowshire, 17 m. w.s.w. of Edinburgh. The old town lies on a steep slope, and the new on a more level site. Freestone, coal, and carboniferous limestone, are wrought in the vicinity. In 1663, king Charles II. granted B. a charter, since which time it has been a free burgh or barony. In the vicinity is the site of an ancient castle, which Margaret, daughter of Robert the Bruce, brought as a part of her dowry to her husband, Walter, great steward of Scotland, who died here. The celebrated gas coal called Torbanehill mineral, which has been the subject of so much litigation, and of discussion and difference of opinion among scientific men, is worked here. B. has manufactures of cotton goods, but mining is the chief occupation of the inhabitants. Pop. '71, 6942.

BATHOMETER, an instrument invented by C. William Siemens, for indicating the depth of the sea beneath a passing vessel. The density of sea-water is about 1.026, while that of solid earth or rock has an average of about 2.75. Hence, the attraction emanating from the water which lies beneath the ship, is less than that which would be exerted

by earth or rock occupying the same relative position, and the greater the depth of the water, the greater the loss of attraction. Hence, further, the weight of a given mass of matter on board the ship will be greater when the ship is ashore than when afloat, by an amount which may be made appreciable by an instrument of sufficient delicacy, and this diminution of weight may become a recognizable function of the greater depth of water. Dr. Siemens fills with mercury a vertical steel tube of small bore, fitted below with a cup-shaped expansion closed with a corrugated steel-plate diaphragm. The pressure of the mercury upon the upper surface of the diaphragm is antagonized by a plate adjusted to bear upon the center of its under surface, and this plate is supported by steel spiral springs that are attached to the top of the column. In the construction of the instrument, care has been taken to compensate for the variations caused in the density of the mercury, and in the elasticity of the steel springs, by change of temperature. As the tension of the springs varies with their extension, while the pressure of the mercury on the diaphragm varies with the attraction from deep or shallow water, the two forces adjust themselves by a movement of parts, and the motion is so magnified by a micrometer screw, having an electric tell-tale, that the apparatus indicates a change of a fathom in depth of water for each division on the scale of the micrometer.

BA'THORI, ELIZABETH, the niece of Stephen Bathori, king of Poland, and wife of count Nadasdi, a Hungarian nobleman, was born in the latter half of the 16th century. Her diabolical cruelty has condemned her memory to eternal infamy. By means of large bribes, she induced an old man-servant and two female servants to kidnap and convey to her, either by stratagem or force, young girls from the neighboring country, whom she slowly put to death in the dungeons of her castle by the most horrible tortures. It is related that on a certain occasion, having violently struck one of her victims, the blood spirted up into her own face, and, as she fancied, left the skin whiter when it was wiped off. An infernal idea instantly possessed her. She invited to a grand banquet all the young girls round about, and caused 300 of them to be put to death, being under the impression that a bath of blood would renew her youth. So monstrous a story is probably exaggerated, but it at least shows that she was conceived capable of it. Inquiry was at length made into the appalling rumors, when it was discovered that this female fiend had murdered, in cold blood, not fewer than 650 maidens. The domestics who assisted her were either beheaded or burned alive; but the countess, whose crimes merited infinitely the greater punishment, was merely imprisoned for life in her fortress of Esej, where she died in 1614.

BATHOS (Gr. *bathos*, depth) is a term employed by critics to designate a ludicrous descent from a lofty thought to a mean one, or a sinking below the ordinary level of thought in a ridiculous effort to aspire. See CLIMAX. It is of the essence of B. that he who is guilty of it should be unconscious of his fall, and while groveling on the earth, should imagine that he is still cleaving the heavens. A good example of B. is the well-known couplet:

And thou, Dalhousie, the great god of war,
Lieutenant-general to the earl of Mar.

BATHS AND WASH-HOUSES, PUBLIC. The last few years have witnessed the erection of a number of public establishments, at which the masses may enjoy a bath for the merest trifle of their weekly earnings. Where steam-engines are employed in connection with cotton-factories or other works, there is usually a certain quantity of waste steam or waste hot water at disposal, which could, at an insignificant cost, be directed into baths for the use of the workmen of the establishment. We are aware of one instance where seven baths were comfortably fitted up at the small expense of £80, in which the men and women bathe on alternate days, to the number of from 30 to 80 a week—paying a mere trifle to the keeper, who attends an hour and a half each evening, and finds towels, soap, etc., nothing being charged by the proprietors for the original outlay. But this is only a small part of the cure for a great evil. Where the masses are densely packed in lanes and alleys, where house-accommodation is dear and limited, where the necessaries of life have to be continually struggled for, and these conventional evils increased, in too many instances, by improvidence—the house is but a night-shelter, affording little or no convenience for the necessary operations of the housewife. Independent of this, a public wash-house is, in point of economy, preferable to any number of isolated efforts. By co-operation, superior accommodation, better apparatus, and a cheaper and more satisfactory result can be obtained; and thus the public wash-house, where self-paying and self-supported, may be classed among the co-operative arrangements which characterize the social features of the age.

Mrs. Catherine Wilkinson of Liverpool, in a year of cholera, bravely offered the use of her small house, and the value of her personal superintendence, to her poorer neighbors, to facilitate the washing of their clothes at a time when cleanliness was more than usually important. The success attending the exertions of a single individual led to the formation of a benevolent society, and ultimately to important municipal arrangements.

In 1844, a public meeting was held at the Mansion House, attended by many persons of wealth and influence, to encourage the formation of B. and W. in London; hence resulted an "Association for Promoting Cleanliness amongst the Poor." Independently

of this movement, a reform had already been commenced by a "Committee for the Houseless Poor," who, among other things, purchased or rented an old roomy building in Glasshouse yard, surrounded by the poor and dense population of the London Docks district. A bath-house and a wash-house were fitted up; baths, cisterns, boilers, cold and hot water, towels, soap, soda, were provided; and the poor were invited to come in, and wash and bathe without expense to themselves. There were also provided pails, brushes, and whitewash, to those who would take the trouble to give a little cleanliness to their poor dwellings. This was effected mainly through the benevolent exertions of Mr. Bowie, a surgeon, who applied himself with earnestness to the subject. The association, afterwards founded at the city meeting, sought two objects—to induce a wish for cleanliness among the poor; and to render public B. and W. *self-paying*, as a guarantee for their permanency. Having obtained plans and estimates from architects, the association built a model establishment in Goulston square, Whitechapel; but the outlay unfortunately reached £26,000. In the mean time, another society had succeeded in establishing B. and W. in George street, Hampstead road, favored by a liberal arrangement on the part of the New River company in the supply of water: this establishment was opened in Aug., 1846. In the same year, parliament passed an act to enable borough-councils and parish vestries to establish public B. and W., supported by borough and parish rates, if the householders should sanction such a proceeding. In 1847, another act strengthened the former; and the two together contain the necessary clauses for defining the details of the plan (see the following article). The parish of St. Martin's-in-the-Fields was the first to take advantage of the new act; and before the close of 1852, six parishes had erected public B. and W. At the beginning of 1856, the list had nearly doubled. The original free but humble building in Glasshouse yard has been abandoned; and so likewise has the establishment in the Hampstead road; but the model building in Goulston square still remains. There were, in 1877, more than 20 of these public and parochial B. and W. in the metropolis.

It is not to be supposed that these efforts have been confined to London. Liverpool took precedence in date, and has since worthily maintained her interest in the matter. Manchester, Oldham, Hull, Bristol, Birmingham, Preston, Bath, Wolverhampton, Coventry, Plymouth, Chester, Sunderland, Bolton, Macclesfield, Oxford, Maidstone, Exeter, Rotherham, Colchester, South Shields, Dublin, Belfast, Glasgow, Dundee, Aberdeen, and other towns, have since adopted a similar course; and it may safely be predicted that borough and parochial B. and W. will increase in number year by year; for if they do not actually pay their full expenses at the low tariff charge, the deficiency will be so small as to be practically unfelt by ratepayers.

When the legislature took up the subject, the purpose of the committee appointed in 1844 was in great part answered; but that committee continued to exist until 1855; and the exertions of its members were attended with very beneficial results, in drawing the attention of influential persons in various countries to the advantages of public B. and W. The French government voted 600,000 francs to assist the promotion of such institutions in France, after the plan of the model establishment; and a scheme was set on foot for erecting fourteen establishments in Paris, for which 2,000,000 francs would be required. The municipality of Venice marked out an expenditure of £33,000 in the erection of B. on the same plan. The Norwegian government applied to the committee for the plans, etc., of their wash-house at Goulston square, as a guide for the erection of one at Christiania; and a subscription was made for the erection of B. and W. at Copenhagen. The Belgian government, and the authorities at Hamburg, Turin, Munich, Amsterdam, Lisbon, New York, and other places, were in like manner furnished with information on the subject.

In nearly all the London establishments, which may also be taken as types of those in the country, the characteristic features are as follows: The B. for males and females are on opposite sides of the building. The separate B., in large well-lighted and well-ventilated rooms, are shut in by walls, generally of slate; and the B. themselves, supplied with 50 or 60 gallons of water for each bather, are either of zinc or enameled iron. There are two, three, or four classes of B., charged differently according to the amount of accommodation afforded. At the St. Martin's establishment, where there are only two classes of B., it has been found that the second-class bathers are thrice as numerous as the first. Arrangements, slightly varying in different establishments, afford means for conveying hot and cold water to every bath. In some instances, there are tepid as well as cold swimming or plunging B.; while two or three of them afford facilities for shower and vapor baths. The washing-rooms, in most of these establishments, are provided with numerous small compartments, doorless and roofless, each for one person. Each compartment contains a boiler and a washing-tub, with taps for hot water, cold water, waste water, and steam: all unlimited in quantity, willful waste of course being guarded against. An American washing-board assists the operations; and a rack-work stand protects the feet. The steam from all the compartments is carried upwards to one great ventilating shaft. The "wringing" of the wet washed linen is effected by putting the articles into a sort of perforated cylinder, which is then rotated with great velocity; the centrifugal force drives out the water through the perforations and interstices, leaving the linen, though damp, much drier than it can be made by the familiar laundry process. The clothes are then taken to the drying-room, where they are hung on frames or "horses"

in small chambers heated with hot air to about 200° or 210°. 10,000 articles of washed clothing can now be dried with about £1 worth of fuel, or much less in the towns of the north. In some of the improved establishments, there is a drying compartment belonging to each washing compartment, effecting a manifest saving of time to the washers; in some of them, too, there is an ironing-board to each compartment; but the general plan is to have a large ironing-room, well provided with irons, ironing-blankets and boards, and heating arrangements. The charge is from 1*d.* to 2½*d.* per hour, according to the class and the accommodation.

One particular establishment at Manchester may usefully be described more in detail, as a type of the general class of B. and W. There is a men's swimming-bath, 70 ft. by 25, with a pavement of polished York stone on a foundation of concrete and cement; the sides are of porcelain tiles laid in cement. There are 32 inclosed dressing-closets. Over these, on iron pillars, are 17 men's warm baths, each 8 ft. by 7. Separated from this gallery by an open passage are 5 extra first-class baths, larger in size, and having shower-baths. There is a second-class swimming-bath nearly like that for the first class; with its gallery of small baths over. The women's baths, in a different part of the building, comprise 4 first and 7 second class. The laundry is at one end of the building. The washing-room is 64 ft. by 38; it comprises 6 first-class and 30 second-class compartments, each of the former provided with three tubs, and each of the latter with two. There is provision for drying any amount of clothes in 20 minutes after the washing and wringing are completed. All the women have access to two patent wringing-machines. There is an ironing-room adjoining, fitted up with stoves. The water-tank has a capacity of 3000 gallons; the baths, if all full, would hold 50,000 gallons.

Since the taking up of this subject by the municipal authorities of various towns, there have been few reliable statistics obtainable relating to the extent to which these valuable establishments are used; but it is known that the B. and W. established by the several parishes either pay their working expenses wholly, or approach so near to it as to encroach very little on the parish rates.

One satisfactory feature connected with the system is, that when the local authorities are slow to establish B. and W., wealthy manufacturers or townsmen often take up the matter at their own expense, and then leave the ratepayers nothing more to do than to provide the small balance of annual working accounts. As an example of free baths for men and boys (without wash-houses), may be cited the establishment opened at Derby in June, 1873, and presented to the corporation by Mr. Ball, M.P. for the borough. It comprises two swimming-baths, one for men and one for boys, each 100 ft. long by 50 in width. There are 57 half-closed dressing-boxes around the men's bath, and 73 open boxes around the boys'. The two baths together hold 260,000 gallons of water, which is renewed once a week.

The least satisfactory part of the system in its practical operation, is that which relates to the wash-houses. Laundresses, boarding and lodging house keepers, and families in the middle ranks of life, use these W. rather than really poor families; they do so because the expense is very low, not because they are unable to pay higher. It is sometimes believed that those for whose benefit the system was established are ashamed to bring their scanty, coarse, and much-worn apparel to a place where it may meet the eyes of others: if this be so, surely a remedy might be applied!

BATHS AND WASH-HOUSES, ACTS REGARDING. The establishment of public B. and W. is regulated in England and Wales by two acts of parliament—the 9 and 10 Vict. c. 74, and 10 and 11 Vict. c. 61—which are to be considered as one act. The sanitary regulations so legalized are merely permissive, and in no respect made compulsory on the public; but their wisdom, benevolence, and consideration for the health of the people, strongly recommend their adoption. The provisions of the act may be adopted for any incorporated borough, or for any parish not within any such incorporated borough; subject, however, in the case of a parish, to the approval of one of her majesty's principal secretaries of state. In the case of a borough, the adoption of the act is left to the discretion of the council of the borough; and the expense is to be charged upon the borough fund, the council being empowered to levy, either as part of the borough rate, or by a separate rate, such sums as may from time to time be necessary. In the case, again, of a parish, it is left to the vestry, with the sanction of one of the secretaries of state, to decide on the adoption of the act; and in such case, the vestry shall appoint not less than three, and not more than seven persons, ratepayers, to be *commissioners* for carrying out the provisions of the act. Regulations for the proceedings of these commissioners are prescribed in the act. The expense is to be charged upon the poor-rate. The vestries of any two or more parishes may concur in carrying out the act.

The act contains numerous other provisions and regulations relating to the facilities required for the operations of the borough councils and parish commissioners: thus, they may borrow money with the approval of the treasury; they may have money advanced to them by the public works loan commissioners; they may avail themselves of the railway companies clauses consolidation act of 1845 for certain limited purposes, such as borrowing money on mortgage, the accountability of officers of the company, the making of by-laws subject to other provisions, and the recovery of damages and penalties.

After these preliminary facilities, the act proceeds to specify the powers of the borough councils and parish commissioners, as to erection or purchase of buildings, etc., for the purposes contemplated. Among other things, it is provided that the number of baths and the number of washing-tubs for the laboring-classes shall not be less than twice the number of those for any higher class or classes.

The council and commissioners respectively are empowered to make by-laws for regulating the use of the B. and W., which, however, shall not be enforced until they have been approved by a secretary of state. These by-laws must make sufficient provision for a variety of purposes specified in the schedule (A) to the act 9 and 10 Vict. c. 47; the scope of those purposes being to secure order, cleanliness, and decency. The charges for the use of the B. and W. are regulated by another schedule attached to the act 10 and 11 Vict. c. 61. In the baths for the laboring-classes, a single cold bath is not to exceed one penny; a single warm or vapor bath is not to exceed twopence. B. for any higher class are not to exceed three times the charges for those of the laboring-classes. In the wash-houses for the laboring-classes, the use of a single washing-tub, and other conveniences, is not to be charged more than one penny for one hour, or threepence for two hours together.

The various local management acts, passed since the above-cited acts of 1846 and 1847, have strengthened the powers of town-councils, etc., for the establishment of B. and W.; but the principle of operation remains nearly uniform—viz., that any surplus outlay, beyond the receipts from bathers and washers, shall be defrayed out of the rates. It may safely be asserted that no item in house-rate is more wisely applied than this. So great is the importance attached by medical men to bathing, that the metropolitan board of works has been urged to establish free public swimming-baths in the metropolis, to supplement the parochial B. and W.; but the question is still undecided.

BATHS and WASH-HOUSES, PUBLIC (*ante*), are not established in the United States to any considerable extent except in some of the larger cities. In New York, Brooklyn, Boston, and some other places, there are large floating structures, with general and single dressing rooms, and an open space in the middle for swimming. There are separate baths, or separate days, for females, and the whole management is conducted and paid for by the city authorities. In 1879, there were four or five in the two rivers at New York; and during the hot season the bathers number many tens of thousands per day.

BATH-STONE, a building-stone extensively used in England on account of its beauty, is obtained from quarries in the Lower Oolite, in Wiltshire and Somersetshire. It is fine grained, of a rich cream color, and is composed of about 94½ per cent of carbonate of lime, and 2½ per cent of carbonate of magnesium, but is free from silica. It is easily wrought in the quarry, some beds cutting almost as readily as chalk, and hardens on exposure to the air, but is not very durable. Within twenty-five years after the reparation of Henry VII.'s chapel, in Westminster abbey, with this stone, it had begun to decompose. The name is derived from the neighborhood of several of the quarries to Bath.

BATH'URST, a name applied to various localities in honor of earl Bathurst, colonial secretary at the time.—1. B. *in New South Wales*, the first county that was settled beyond the Blue Mountains (q.v.), long believed to be impassable. It was not before 1813 that a practicable route was formed; and in April, 1815, governor Macquarie crossed the range by the newly made road with his lady and a numerous retinue, in order to mark with becoming "pomp and circumstance" so important an epoch in the growth of the colony. B. has been still further distinguished in the history of New South Wales as the seat of its gold-fields. As early as 1844, the precious metal had, on geological grounds, been supposed to exist in Australia; but it was only on 12th Feb. 1851, that Mr. Hargreaves, a digger of California experience, washed the glittering prize out of a tin dish of gravel on the Bathurst Plains. The county is bounded on the n.e. by the Macquarie, and on the s.w. by the Lachlan. The whole district is admirably adapted to pastoral pursuits. It is well watered, and, being 1970 ft. above the level of the sea, it has a moderate temperature. Its chief town, which is now the third in New South Wales, is a handsome city with numerous elegant public buildings, and was erected into a municipality in 1862. Pop. '71, of city and district, 16,826.—2. Bathurst Island, *off North Australia*, about lat. 12° s., and long. 130° east. It is fully 2° due w. of Port Essington, with Melville Island between. Its area may be estimated at 1000 sq. miles. Excepting the w. end, which is barren, the island is densely wooded.—3. B., the principal settlement of the British colony on the Gambia. It is situated on a small island at the mouth of the river, in lat. 13° 28′ n., and long. 16° 32′ west. Pop., about 3000, chiefly negroes. The principal buildings are the government house, an hospital for liberated Africans, and Wesleyan schools. The exports consist of gum, wax, hides, ivory, gold, tortoise-shell, rice, cotton, teak, palm-oil, and native cloths.—4. B., in Upper Canada, a district on the right bank of the Ottawa, here the boundary between the two Canadas. It contains the Rideau river and canal, thus occupying an important position with regard to the interprovincial trade. The removal, in 1858, of the seat of government to Ottawa, tended still further to promote the prosperity of the district.—5. B., an island in the Arctic ocean, intersected by the 100th meridian, and situated immediately

beyond the 75th parallel. Sherard Osborn here found the vertebræ of an ichthyosaurus —one of the few instances of organic remains occurring on the American side of the polar basin. See ARCTIC OCEAN.

BATH'URST, ALLEN BATH'URST, Earl of, 1684–1775; an English statesman. He was sent to parliament, in 1705, and distinguished himself as a supporter of the union of England and Scotland. In 1711, queen Anne made him a baron, and he won further distinction in the upper house by impeaching the directors of the notorious South Sea scheme. B. was a determined opponent of Walpole, and when that minister was forced to resign, B. was made a member of the privy council. In 1757, he became treasurer to the prince of Wales, and when the prince became George III., B. still continued in the privy council, but on account of age took no further action in politics. Lord B. was a generous patron of literature, and such writers as Congreve, Vanburgh, Swift, Prior, Rowe, Addison, Pope, Arbuthnot, Gay, and others, were happy in his acquaintance. Pope dedicated his *Epistle on the Use of Riches* to Lord B., and complimented him in characteristic lines. B. received further elevation to an earldom in 1762, and lived to see his son a baron and lord chancellor of England.

BATH'URST, Earl HENRY BATH'URST, an eminent tory statesman, b. 22d May, 1762, son of second earl (lord chancelor from 1771 to 1778), was in 1804 appointed master worker of the mint. In 1807, he became president of the board of trade, and was secretary of state for foreign affairs from 11th Oct. to 6th Dec. 1809. Appointed, 11th June, 1812, secretary for the colonies, in the administration of the earl of Liverpool, he held that office for sixteen years. In 1828, in the Wellington administration, he became president of the council, which office he retained till the resignation of the ministry in 1830. He died 26th July, 1834. At the time of his death, he was a teller of the exchequer, clerk of the crown, and elder brother of the Trinity house, K.G., D.C.L., F.R.S., F.S.A., etc. He was much esteemed by his party. His son, Henry George, succeeded as fourtn earl. He died in 1866, and was succeeded by his brother, William Lennox, fifth earl.

BATH'URST, RALPH, 1620-1704; uncle of lord B., an English physician, prelate, and wit. In medicine he rose to eminence, and in the time of the commonwealth was appointed physician to the state. After the restoration he abandoned medicine, took holy orders, was chaplain to the king, and afterwards dean of Wells. Later he was vice-chancellor of Oxford, and was offered the see of Bristol, which he declined. He was a perfect master of ridicule, and made that his weapon to correct college delinquents. Some of his verses in the *Musæ Anglicanæ* are excellent of their kind.

BATH'URST INLET projects s. about 75 m. from Coronation gulf in the Arctic ocean, 68° n., 111° w.; 300 m. from Great Slave lake.

BATHYÁNI. See BATTHYÁNYI, *ante*.

BATHYBI'IUS, the name given by Huxley to a low form of protozoan found in calcareous mud brought up by sea dredging. Prof. Huxley supposes this substance to cover a large part of the bed of the ocean, and to be a living expanse of transparent, gelatinous, or protoplasmic matter, growing at the expense of inorganic elements. Others regard B. not as an animal, but as slime enveloping foreign bodies and the remains of once living organisms, and also numerous living forms. Similar growth in fresh water is called "pelobius."

BATHYL'LUS of ALEXANDRIA, a freedman or favorite of Mecænas. He excelled in pantomimic dancing, and in the representation of comic characters.

BATIGNOLLES, a thriving t. of France, in the department Seine, n.e. of Paris, of which city it forms a suburb.

BATJAN. See BATSHIAN.

BATLEY, a Yorkshire t., near Dewsbury (q.v.).

BAT MALTHÆ'A, *Malthæa vespertilio*, a fish of the Atlantic ocean, noted for its extreme ugliness of shape; a monstrous aggregation of hideousness. It is something like a bat, and something like a scorpion; is covered with prickles and warts, with fins like wings armed with claws, goggle-eyed, and of a shape that defies measurement or delineation.

BATN-EL-HA'GAR (womb of rocks), a stony district, stretching along the Nile, in lat. 21° to 22° n., and long. 30° 40′ to 31° 10′ east. The Nile, in the upper portion of the district, is often forced by the approaching rocks into a very narrow channel, and its navigation is frequently interrupted by small islands, rocks, and cataracts. The district is peopled by Beduins, and other Arabs, who go naked and derive a scanty subsistence from beans and the fruit of a wild shrub called *kerkedan*.

BATON—variously written Battoon, Batune, and in old French Baston—is the figure in heraldry commonly known as the Bastard Bar (q.v.).

BATON is the name of a short staff presented by the sovereign to each field-marshal, as a symbol of his newly bestowed authority. It is also the name of the long staff carried by the drum-major of an infantry regiment.

BATO'NI, POMPEO GIROLAMO, 1708–87; a native of Lucca. He was regarded in Italy as the great painter of the 18th c., and did much to rescue the art from the intense mannerism into which it had fallen. His works, though not of a high order, are generally well designed and graceful. The group "Peace and War" is considered his best production. He painted a great number of pieces, and was also celebrated for his portraits.

BATON ROUGE, a city on the e. bank of the Mississippi, 129 m. above New Orleans, and formerly capital of the state of Louisiana. As far back as 1808 it was the seat of a college. Its pop. in 1870 was 6498, in 1880, 7,235. B. R. contains a national arsenal and barracks, a military hospital, an asylum for the deaf and dumb, state university, state penitentiary, an elegant state-house, four churches, and two newspaper offices. The district is very fertile, producing large quantities of cotton, sugar, and maize. B. R. was more than once the scene of important operations during the civil war.

BATRA'CHIA (from Gr. *batrachos*, a frog), in zoology, nearly synonymous with *amphibia*, the name of what is now generally regarded as a distinct class of the subkingdom *vertebrata*, intermediate in many respects between fishes and reptiles (q.v.). The B. used often to be treated as one of four orders into which the reptiles were divided. The most important difference between the B. and the reptiles is that the young B. undergo metamorphoses, and breathe by gills alone, in the earlier part of their life; whilst in their adult state they either breathe by lungs alone, or possess at once both lungs and gills. The body is also covered with a soft naked skin, through which water is imbibed, and through which the aëration of the blood appears to be in part carried on. The B. are all oviperous; their eggs are not covered with a hard shell, but merely with a soft membrane. Fecundation commonly takes place after the eggs have been deposited. It is sometimes given as a distinctive character of B., that, in their adult state, they have limbs, but in some genera these are very rudimentary, and they are altogether wanting in *Cæcilia* (q.v.), a genus which is now decidedly referred to this order, because it has been found to undergo the metamorphosis from a gill-breathing to a lung breathing state, and which Cuvier, with hesitation, placed among serpents, because the fact of its metamorphosis had not then been ascertained. The ordinary number of limbs is four, but in the *siren* (q.v.) there are only two.—Another character frequently given as distinctive of the B., that their feet are destitute of claws, is in like manner only general, and not universal.

In the earlier period of life, the form of the B. is fish-like, of which the common tadpole, the young of the frog, is a familiar example; and this form some of them retain with comparatively little modification, whilst some of them ultimately acquire a form resembling that of lizards, with which the newts were indeed ranked by Linnæus as species of the same genus; and others, as frogs and toads, assume a peculiar quadruped form, the tail entirely disappearing, except in the elongated coccygeal bone which represents it to the anatomist.

In their anatomy, the adult B. present some important points of resemblance to fishes; in some important points, they differ both from fishes and from other reptiles. The skull resembles that of fishes in its general form, although rather agreeing with other reptiles in the parts of which it is composed. Teeth are often entirely wanting, sometimes they are present only in one jaw; when present, they are generally small and numerous, either in a single row or aggregated. In some of the fossil genera, however, which are referred to this order, the teeth are of large size.—The B. have either no ribs, or they have mere rudimentary ribs. They have, however, a breast-bone, often in great part cartilaginous, to which some of the most important muscles are attached. They breathe air by a sort of gulping.—The heart of the B. was long believed to have only one auricle and one ventricle, but the apparently single auricle is now known to consist of two divisions. As in the class reptiles, only a part of the blood received from the circulating system is sent to the organs of respiration, and another part returns immediately into the circulation. See REPTILES.

In the wonderful transformations which the B. undergo, the circulation of the blood is changed in accordance with the change in the organs of respiration. These, in the earliest stage, are external gills, which appear as long colored fringes, hanging loosely upon each side of the neck. In some B., these external gills, which resemble those of the aquatic mollusca, remain till the lungs are sufficiently developed for respiration; in some, as the axolotl (q.v.), they are permanent during the whole of life. In the greater part of the B. however, the external gills soon disappear, and are replaced by internal gills, when the tadpole exhibits its most perfectly fish-like form, its mode of progression also corresponding with that of fishes. Its respiration is carried on essentially as in fishes, water entering the cavity of the mouth, and being forced out through the gill openings, so as to come in contact with the minute filaments of the gills. The gills are attached, as in fishes, to arches connected with the hyoid bone. In this stage of existence, the large arterial trunk which proceeds from the ventricle of the heart, sends forth, from a bulbous enlargement which it forms, as in fishes, an artery to each of the gills, and the blood after being aërated in them, is collected into an aorta, and proceeds into the general circulation. But an artery is also provided on each side for the conveyance of blood to the lungs, both the lungs and their arteries being at first rudimentary, but increasing,

whilst the gills, on the contrary, diminish along with the blood vessels connected with them; and the gill-breathing is gradually transformed into a lung-breathing animal, no longer perfectly aquatic, as at first, or capable of existence only in water, but amphibious, or almost entirely terrestrial, and incapable of remaining long under water without coming to the surface to breathe.—Whilst these changes take place, others no less extraordinary are also going on. The tadpole which subsisted on vegetable food, and possessed a mouth adapted to the purpose of feeding on it—a small horny beak—acquires a mouth fitted for seizing and swallowing small insects, slugs, etc., upon which the adult B. chiefly or exclusively feed, and his habits change accordingly. The mouth of the *siren*, however, always retains a character somewhat similar to that of the tadpole.—In the course of transformation, a pelvis is formed, and limbs sprout forth, which in some B., as frogs, become very perfect and powerful. Whilst the limbs grow, with all their bones, joints, muscles, blood-vessels, and nerves, the vertebræ, in many B., diminish in number, and the tail gradually shortens and disappears.

The extremely different characters of the adult B. suggest the idea of an arresting of the metamorphosis at different stages; but whilst this idea may be helpful to our understanding of the close affinities which really pervade the whole order, it must be remembered that it does not equally apply to all parts of the animal system; and that even as to those which have been particularly mentioned in the brief account above given of the metamorphosis of the B., some in their perfect state appear to have one part in what, for convenience, may be termed a more advanced state than another; whilst all are adapted with equal perfection to the situations in which they are appointed to live, both with reference to the wants of their own existence and the preservation of that of their species.

If the limbs of the tadpole or the frog are injured or destroyed during their growth, the loss is wonderfully repaired. This power of reproducing lost limbs continues to be possessed in an extraordinary degree by the adult newt (q.v.).

B. are generally inhabitants of warm or temperate climates. Those which inhabit temperate climates generally become torpid during winter. They are either almost entirely aquatic or are found in moist situations. The British species are very few. In some of the Scottish isles they are unknown.

B. are commonly divided into two sub-orders—*caducibranchiata*, in which the gills (*branchiæ*) disappear (are *caducous*), and *perennibranchiata*, in which they are persistent (*perennial*). The perennibranchiate Batrachia are comparatively few. Axolotl, siren, and proteus are examples. The caducibranchiate Batrachia are subdivided into *tailless* or *anourous*, as frogs, toads, etc.; and *tailed*, as newts, salamanders, etc. Some of the frogs and toads of warm climates are much larger than those of Britain; but the largest known B. are the *sieboldia maxima* of Japan, and *protonopsis horrida* of the Ohio (variously styled helibender, mud devil, ground puppy, young alligator, and fish salamander), both creatures of the newt or salamander form, the latter of which is 2 ft. long, and the former is of still greater size.

Fossil remains and footprints in rock attest the existence, in former geological periods, of B. of large size. "It is only in tertiary and post-tertiary strata that extinct species referrable to still existing genera or families of this order have been found." These occur both of the tailed and tailless forms. One of them has been a subject of particular interest, because its remains, when first discovered by Scheuchzer, in the beginning of the 18th c., were mistaken for the remains of a human being, and the discoverer enthusiastically urged them upon the attention of his contemporaries as a proof of the deluge. To this salamandroid fossil the name *andrias* (from the Gr. for man) *scheuchzeri* has been given.—Footmarks in the sandstones and shales of the coal-measures in Pennsylvania seem to have belonged to B. resembling frogs or toads, but of great size, some of the footprints being 2 in. in diameter, and a breadth of nearly 4 in. between the right and left footprints.—Some of the older batrachian fossils differ so widely from all existing types that new sub-orders have been formed for them. Those of the sub-order *ganocephala*—of which *archegosaurus* (q.v.) is the best known—are remarkable for having the head covered with bony plates; those of the order *labyrinthodontia*, for the labyrinthic structure exhibited in the transverse section of the teeth. See LABYRINTHODON.

BA'TRACHOMYOMA'CHIA (the War of the Frogs and the Mice), a Greek mock-heroic poem, erroneously ascribed to Homer, with whose works it has been generally printed. Pigres of Caria, who lived in the times of the Persian wars, was named amongst the ancients as its author. It is a parody on the *Iliad*, in which the military preparations and contests of beasts, with single combats, intervention of the gods, and other Homeric circumstances, are described with much humor.

BATRACHUS. See FROG-FISH.

BATSHIAN' (correctly BATJAN), one of the Moluccas, lies w. of Gilolo, between 0° 13′ to 0° 55′ s. lat., and 127° 22′ to 128° e. long. It belongs to the Dutch residency of Ternate, is formed of two peninsulas, and has many mountains. B. produces gold, copper, much coal, sago, cocoa-nut trees, rice, cloves, and fine timber. There are sulphur springs. Area, 900 sq. miles. Pop. 1800, a mixed race of Portuguese, Spaniards, Dutch, and natives. Chief t., Batjan, with 200 houses, on the e. coast.

BATTA, in relation to the British army in India, is an allowance in addition to the ordinary pay of officers. The pay is fixed; but the B. varies according to the part of the country in which the troops are placed, and also depends on the circumstance of their being in the field or in cantonments. If in the field, or more than 200 m. from the presidential government cities, the officers receive full B.; if in the garrison, or in cantonment within that distance, half batta. During the troubles of 1857 and 1858, the government was frequently embarrassed in determining whether particular officers were entitled to full or half B., owing to the confusion into which the whole military system was temporarily thrown.

BATTALION is the unit of command in infantry. It comprises the largest number of men who, when drawn up in array, can conveniently hear the word of command from an officer. In whatever ways the armies of Europe differ in other particulars, they seldom depart very far from a mean *war*-strength of 1000 men per battalion. Two or more of those units combine to form a *regiment* (with exceptions presently to be noticed); and those regiments are further aggregated into *brigades*, *divisions*, and *corps d'armée*, or other large groupings. The unit, or B., is divided into *wings*, and these into *companies* and *squads*. The continental regiments are for the most part so large as to comprise several battalions each; but the British infantry regiments, in time of peace, have mostly only one B. each. The usual way of increasing the British infantry in war-time is, not by creating new regiments, but by increasing the number of battalions per regiment, and of companies per battalion. In 1878, there were 110 regiments of line-infantry; of these, 83 had only 1 battalion each, 25 had 2 battalions, and 2 had as many as 4. The full complement of a B. is usually 12 companies; and when these are drawn up on parade, two ranks in depth, the two choice companies, called the "grenadier" and the "light-infantry" companies, are placed at the right and left extremities of the whole line; the other eight companies, each designated by a number or letter, being between them. In this form, the front of a B. of 1000 men is about 390 yards in length.

An English B. of 900 private soldiers approaches near 1100 strong when the officers, etc., are included. The following may be taken as the component elements, under the average *war* arrangements of the British service: 10 regimental staff-officers (lieut.-col., 2 majors, adjutant, instructor in musketry, surgeon, paymaster, and quartermaster); 36 company officers (capt., lieut., and sub-lieut.); 1 warrant officer (regimental school-master); 10 non-commissioned staff officers (staff and chief sergeants); 50 non-commissioned company officers (color-sergeants and sergeants); 900 rank and file (50 corporals, 850 privates, and 24 drummers).

The relation which the B. bears to the regiment, in various details of discipline and service, will be better noticed under REGIMENT; while a few related matters of a more general nature will be found treated under BRITISH ARMY.

BATTALION (*ante*). In the U. S. army, infantry regiments have one B.; cavalry and artillery have two. Detachments of more than a company and less than a regiment are frequently called battalions.

BAT'TAS, a people inhabiting that part of Sumatra between 0° 20′ and 2° 30′ n. lat. They claim to be the first settlers of Sumatra, and cling to the customs of their ancestors. The B. are light-brown, of middle stature, have somewhat prominent features, and long hair. They believe in a supreme Creator, and the influence of good and evil spirits. The men are lazy, and engage in hunting, while the women grow rice, collect pepper for trade, weave and dye cloth. They make white earthenware, iron implements, and ornaments of gold, copper, iron, and shells. Their houses are of wood, and the villages have earthen walls. The B. are nominally governed by the rajahs of Bata, Simamore, Salindong, and Bŭtar. The language is a Malay dialect, written on bamboos, in a peculiar alphabet, from the bottom upwards, but laid horizontally, and read from the left. A man may have many wives, paying a dowry of ten buffaloes for a chief's daughter, and five for one of lower rank. Cannibalism formerly prevailed, the victims being *only* murderers, prisoners of war, and adulterers. Women were never eaten.

BATTASZEK', a market-t. of Hungary, co. Tolna, on the w. of the Danube. Pop. '69, 6542.

BAT'TEL, TRIAL BY, or WAGER OF BATTEL. This relic of our legal barbarism is happily of the things of the past, having been abolished by act of parliament, the 59 Geo. III. c. 46, and might have been passed over with a brief notice, had it not been for a circumstance which we shall presently mention, and which affords a curious and striking illustration of a principle peculiar to the character of English law, as distinguished from the legal systems of other countries.

The trial by B. was a proceeding by way of appeal, and it obtained in civil and criminal cases, and also in military matters, to which, indeed, it was more appropriate. It consisted of a personal combat between the parties in presence of the court itself; and it was grounded on the impious idea of an appeal to Providence, the expectation being, that Heaven would give the victory to the innocent or injured party. In civil cases, the B. was waged by champions, and not by the parties themselves; but in criminal cases,

the parties fought in person, unless the appellor were a woman, a priest, an infant, or a man of the age of 60, or lame, or blind, all of whom might refuse the wager of B., and compel a trial by jury. Peers of the realm also could not be challenged to wage B., on account of their personal dignity, nor, by special charter, could the citizens of London, fighting being considered foreign to their education and employment. Whether by champions or in person, the mode of proceeding was the same. The appellee, or defendant, as he might be called, threw down his glove, and declared that he would prove his right, or defend himself with his body. The appellor, or prosecutor, in accepting the challenge, took up the glove, and replied that he was ready to make good his appeal, body for body; and thereupon the parties, holding each other's hands, joined issue before the court in a very formal and solemn manner. The weapons used were batons or staves an ell long, and a four-cornered leathern target, and the combatants were obliged to swear that neither of them would resort to sorcery or witchcraft! The B. lasted till the stars appeared in the evening, and the party who by that time had either killed or got the better of his opponent, was considered the successful suitor of justice. In a charge of murder, if the accused was slain, it was taken as proof of his guilt, and his blood was attainted; and if so far vanquished as not to be able or willing to fight any longer, he was adjudged guilty, and sentenced to be hanged immediately!

So late as the year 1818, this barbarous procedure was solemnly decided by the court of king's bench to be a valid and legal mode of trial, which the king's subjects were free to adopt! Of course, the principle was, that all laws, no matter how unsuitable to the times, could be enforced, unless expressly repealed by act of parliament. As a matter of curiosity, we may give the names of the parties (they were of the laboring-class) who seriously submitted their contention in the above form before lord chief-justice Ellenborough and his brother-judges of the period. The case is that of Ashford *v.* Thornton, and is reported in the first volume of Barnwall & Alderson's *Reports*, p. 405. As we have stated, the court decided in favor of the validity of the trial, one of the judges remarking that sufficient had not been stated to induce their lordships to refuse the B., and another more plainly and unequivocally observed that the defendant was "entitled to this his *lawful* mode of trial." But lord Ellenborough put the matter more clearly by stating, that "the general law of the land is in favor of the wager of B., and it is our duty to pronounce the law as it is, and not as we may wish it to be; whatever prejudices, therefore, may justly exist against this mode of trial, still, as it is the law of the land, the court must pronounce judgment for it." Happily, the pugnacious litigant who obtained this judgment was induced to go no further, and the above statute, the 59 Geo. III. c. 46, was passed, by which the shocking ordeal was wholly abolished.

In Scotland, we believe the matter would have been differently disposed of; for the judges there, following the doctrine of the Roman law, would have held the proceeding to have been in desuetude and obsolete, and there the matter would have ended. Mr. Rush, the then American envoy to the British court, thus justly remarks on this case in his *Residence at the Court of London* (published 1833). "To repeal laws belongs to the legislature. Courts expound and apply them. Free government is complex, and works slowly; tyranny is simple, and does its work at once. An absurd law may sleep in a free code, because overlooked; but whilst there, it is the law. It is so, I suppose, that we must reason; and generally, the reason would be right. Yet it might have been thought that, in a case like this, long disuse added to obvious absurdity, would have worked the silent repeal of the law, according to the doctrine of desuetude under the Roman code."

Montesquieu, in his *Spirit of Laws*, book 28, chapters 20 and 22, very ingeniously and plausibly deduces the modern practice of dueling and the so-called laws of honor from the above barbarous judicial combat. See ORDEAL.

BATTEN, or LAY, or LATHE, is the swing utensil of a loom, by which the weft or woof is struck home, and in which the shuttle runs. B. and lay are synonymous, B. being the English name, and lay the Scotch. See WEAVING.

BATTENS, a species of sawn fir timber, of smaller dimensions than the kind called planks. B. are usually from 12 to 14 ft. long, 7 in. broad, and 2½ in. thick. Cut into two boards (1¼ in. thick), they are used for flooring; cut into three boards, they are put on roofs below slates; in narrower pieces, they are put upright on walls for fixing the laths for plastering. The best B. are brought from Norway, and sold wholesale by wood-merchants.

BATTER, in architecture, used as a verb to express the manner in which the walls of towers, which are smaller at the top than at the bottom, slope inwards. The walls of wharfs, and those built to support embankments and the like, usually batter.

BATTERING-RAM, an engine of war used in ancient times, and in the middle ages. It consisted of a beam of wood, with a mass of bronze or iron on one end, resembling the head of a *ram* (in Lat. *aries*). In its simplest form, it was borne and impelled by the hands of the soldiers; afterwards, it was suspended in a frame, and made to swing. Another form moved on rollers. The alternating motion was communicated by ropes. To protect those working it, a wooden roof (*testudo*, was constructed over it, and the whole was mounted on wheels. The beam of the ram varied from 60 to 120 ft. in length, the head sometimes weighed above a ton, and as many as 100 men were employed

in impelling the machine. When the blows were long enough continued, hardly any wall could resist. When or where it was invented, is unknown. It is mentioned by Ezekiel. The Romans derived it from the Greeks.

BATTERSEA, a s.w. suburb of London, situated in Surrey, on the s. bank of the Thames, at the bridge to Chelsea, which is nearly opposite. It lies in B. parish, which is partly laid out in market-gardens for London, and has many manufactories. The church has a monument to the celebrated lord Bolingbroke. The flats, called B. Fields, once famed as a rich botanical station, are now formed into a public park. Adjacent to the park, the Thames is crossed by B. bridge (lately rebuilt), Albert bridge, Chelsea suspension bridge, and a railroad bridge. The first asparagus raised near London was grown by the market-gardeners of Battersea; but railways have much changed the locality.

BATTERY, in criminal law, means the beating or wounding, or more correctly, an assault by beating or wounding of another. Violence or force is not a necessary element in this offense, but the least touching, however trifling, of another's person in an angry, rude, insulting manner, is a B.; for the law, says Blackstone, cannot draw the line between different degrees of violence, and therefore totally prohibits the first and lowest stage of it, every man's person being sacred, and no one having a right to meddle with it in any the slightest manner. The remedy for an injury of this kind may be either by a civil action, as for damages, or by indictment, as for a misdemeanor. Where the B. is on a man's wife, the former may sue for damages by action of trespass, and it must be brought in the names of the husband and wife jointly; but if the maltreatment be so serious as to have deprived the husband for any time of his wife's company, the law then gives him a separate remedy, by an action in which he may recover special damage, on the ground of the loss of his wife's society, whilst suffering from the beating. By the common law procedure act, the 15 and 16 Vict. c. 76, the remedy for such ill usage is further varied, for by section 40 of that act, it is provided, that in any action brought by a man and his wife for an injury done to the latter, it shall be lawful for the husband to add thereto claims in his own right, and separate actions brought in respect of such claims may be consolidated, if the court or a judge shall think fit.

It is a good defense to prove that the alleged B. happened by accident, or that it was not in anger, or that it was merely the correction which a parent or master is entitled to use to a child, or scholar, or servant, or that it was done in self-defense, or in defense of a wife, a husband, a parent, a child, a master, or a servant; or that it was such personal force as a proper officer was entitled to employ, or that the defendant has already been summarily proceeded against under the 24 and 25 Vict. c. 100, by sections 44 and 45 of which act it is provided that further proceedings shall be barred where the complaint has been disposed of by two justices either by conviction or dismissal of the case, provided, in the former case, the defendant has paid the penalty, and suffered the imprisonment awarded; and, in the latter, the magistrates have dismissed the case, because it was justified, or so trifling as not to merit punishment, and this be forthwith certified under their hands.

In the Scotch law, there was what was called a B. *pendente lite*, which consisted in assaulting an adversary in a lawsuit during its dependence. This peculiar offense was created by two old Scotch statutes passed respectively in 1584 and 1594—and which curiously provided as a punishment the loss of the cause to the offender—but they were repealed in 1826 by the 7 Geo. IV. c. 19.

BATTERY, in military language, has two meanings: the one relating to field operations; the other, to fortification. A B. in field-operations consists of from 4 to 8 (in the British army, usually 6) pieces of ordnance, together with the necessary gun-carriages, ammunition-wagons, horses, artillerymen, and officers. A B. of foot-artillery (see ARTILLERY, ROYAL REGIMENT OF) is usually called a *field* B., as distinguished from a *horse* B. There are also *heavy* and *light* batteries, according to the weight of the ordnance. The term B. is also applied in a narrower sense to the *personnel*, or complement of men and officers attending such a set of guns. The designation for this used to be, in the foot-artillery, a *company*, and in the horse-artillery, a *troop;* but by an order issued in 1850, both these terms are now nearly superseded by the word B., thereby giving complexity to a term already used in two different meanings. The personnel of a field B. of six 12-pounder rifled guns, is thus composed: 1 major, 1 captain, 3 lieutenants, 1 surgeon, 1 battery sergeant-major, 1 battery quartermaster-sergeant, 6 sergeants, 4 corporals, 4 bombardiers, 66 gunners, 2 trumpeters, 1 farrier and carriage-smith, 3 shoeing-smiths, 2 collar-makers, 1 wheeler, 61 drivers (privates)—in all 158. In war, gunners and drivers would be added till the total strength of the battery became 277. Two batteries together form the command of a lieut col., and have the services of a veterinary surgeon between them.

The *matériel* of a 12-pounder B. of 6 guns comprises 6 carriages for the guns, 1 spare gun-carriage, 3 store-wagons, 1 store-cart, 1 forge-wagon, 1 rocket-wagon, 12 gun-ammunition wagons, and 6 wagons for small-arms ammunition for the use of the infantry. To draw these guns and vehicles are required in war about 212 horses, together with 35 saddle-horses, and 8 baggage-horses. The vehicles and boxes are prepared for the reception of 1284 rounds of ammunition for the guns, 150 rockets, and 98,280 rifle cartridges.

There is also carried a supply of empty cartridges, port-fires, fuses, quick match, slow match, and an immense number of tools and small articles, besides stores for the wheelers, shoeing-smiths, and collar-makers. Nearly all these supplies are equally divided, so as to make each independent of the others; but some of the stores are in reserve, for the use of the whole battery.

A B., in fortification, is a row of large guns of any number from 2 to 20 or upwards, mounted on an earthwork or other platform. It differs from an artillery or field B. in having no horses or vehicles immediately belonging to it. Siege-guns are mostly placed in or on such batteries; and when an army is preparing to resist the occupation of a particular place by an enemy, a B. of position is frequently one of the defensive means adopted. On the other hand, the fortifications on and within the walls of a stronghold generally obtain other names than that of B.; although particular rows of guns in certain places may be so called. Military engineers distinguish many different kinds of batteries, according to the nature of the duty which they are to fulfill, or of the ground on which they are placed. An *elevated* B. has the parapet raised above the ground; the earth for forming it being obtained from a ditch in front. A *half-sunken* B. has the interior slope sunk a little below the surface. A *sunken* B. has the base from 24 to 42 in. below the level of the ground. The guns mounted on these three kinds of batteries partake in the varying elevations of the batteries themselves, and are adapted to different modes of firing on the enemy. A *siege* B. consists of a range of heavy guns, for silencing the enemy's fire, ruining parapets and buildings, and making a breach through which infantry may enter. A *cavalier* B. is especially elevated, to fire over a parapet without embrasures. In the *Moncrieff* B., the gun is mounted so as to fire over a parapet 10 ft. high, the recoil causing it to descend after the shot. *Enfilade, en revers, en écharpe, ricochet, cross, oblique*, etc., batteries differ chiefly in the direction in which they pour out their fire. The distinction between *gun*-batteries, *howitzer*-batteries, and *mortar*-batteries, depends on the kind of ordnance employed. A mortar B. has a ditch of extra width, to afford spare earth for a platform of extra strength and solidity. A military engineer, in planning a B., makes his calculations in such form that the quantity of earth taken out at one spot may about equal that heaped up in another.

These batteries are all nearly alike in the general principle of their construction. They consist primarily of an *épaulement*, or built-up shelter, behind which the guns are placed; the platform on which the guns actually rest may or may not be above the ordinary level of the ground, according to the nature of the battery. The épaulement or parapet is of immense thickness, to resist the action of the enemy's cannon balls. The thickness at the top is seldom less than 12 ft., and may be as much as 20; for it is found that a 24-pounder ball will penetrate 18 ft. of earth. The guns are placed about 20 ft. apart, behind the parapet. Some batteries are straight, with all the guns parallel; while others may be portions of a triangle (*redan*) or a polygon, and the earthwork has to be constructed accordingly. There is generally a ditch from 12 to 20 ft. wide, outside the earthwork; and the depth from the crest of the parapet to the bottom of the ditch is 12 to 16 feet. For gun and howitzer batteries, there are embrasures through which the firing takes place; but mortar batteries are without those openings.

Sometimes the épaulement is thrown up loosely, in haste; but for the better kinds of batteries, fascines, gabions, and sand-bags are largely employed. The main structure is lined with fascines 9 ft. long, and the embrasures lined with other fascines 18 ft. long—40 or 50 of the two kinds being required per gun. The fascines here spoken of are long bundles of brush-wood, weighing 30 to 200 lbs. each. Sometimes sand-bags are used instead of fascines, each containing about a bushel of sand or earth; and sometimes gabions, which are wicker cylinders filled with earth. A 6-gun sand-bag B., made wholly of these materials, requires nearly 8000 sand-bags.

The fate of a field B. often decides a battle. At the battle of the Alma, when once the guards and highlanders had reached the Russian batteries on the hill, the day was won. At the battle of Inkermann, the issue depended mainly on the possession of a small 2-gun sand-bag B., which remained, after many vicissitudes, in the hands of the allies.

BATTERY (*ante*), in criminal law, any unlawful beating or other wrongful physical violence or constraint inflicted upon a person without his consent. B. must be wilfully committed or result from want of care. An injury done in an angry, rude, or spiteful manner, such as spitting on a person, or even touching him in anger, or to insult, or annoy, is a B.; or it is a B. if one strike a cane in the hands of another. But B. may be justified, as in a parent's correction of a child, or a schoolmaster's discipline of a scholar, or as a means of preserving the peace, or of defense, or the protection of others; but in such cases the B. must not exceed the necessary amount; and a B. may also be justified in defense of one's property.

BATTERY, Floating. See Floating Battery.

BATTERY, Electric and Galvanic. See Electricity and Galvanism.

BATTHYAN'YI, one of the oldest, richest, and most celebrated families of the Hungarian magnates, which can trace its origin as far back as the invasion of Pannonia by the Magyars, in 884 A.D., and which has given to Hungary many warriors and statesmen. The surname is derived from lands obtained in the 14th c.—Balthasar von B., who was the head of the family in the latter half of the 16th c., fought with distinction in the

Turkish wars, and constantly maintained at his own expense 1200 infantry and 500 cavalry.—Charles, prince of B., a lieut. field-marshal of the empire, distinguished himself in the Bavarian war of succession, and particularly by a victory over the French and Bavarians at Pfaffenhofen on 15th April, 1745.—Count Casimir B., a member of the principal branch of the family, was b. 4th June, 1807. He was minister of foreign affairs in Hungary during the insurrection in 1849, in which he also distinguished himself as a military governor. After the catastrophe of Vilagos, he fled, along with Kossuth, into the Turkish territory, where he remained till 1851. He then went to France, and d. at Paris, 13th July, 1854. Count Louis B., belonging to another branch of the same family, and b. at Presburg in 1809, having espoused the national cause, yet seeking to maintain the connection with Austria and his allegiance to the Austrian sovereign, was appointed president of the ministry, when Hungary obtained a ministry of its own, in Mar. 1848. His ability was not equal to the goodness of his intentions, and the circumstances in which he was called to act were very difficult and embarrassing. He did not hold the office long, and afterwards took part in public affairs, chiefly as a member of the diet, and with great moderation. Yet, after the Austrians entered Pesth, he was arrested in Jan. 1849, and on 6th Oct. was executed by sentence of martial law. His condemnation was unexpected, and awakened the more sympathy, because all men regarded it as unjust.—A prince B. occupies at present a prominent position on the turf, winning the Derby of 1876.

BATTICALO'A, a t. in the eastern province of Ceylon, on an island, 7° 44′ n., 81° 52′ e.; pop. 3353. It is important for its haven and adjacent salt lagoons. There is a fort, and a small English settlement. Pop. of the district, 93,220.

BATTLE, a t. in e. Sussex, 8 m. n.w. of Hastings, where the country rises in wooded swells. Consisting of one street, built along a valley extending from n.w. to s.e. Pop. '71, 3495. It is noted for its manufacture of gunpowder, well known to sportsmen as B. powder. It was anciently called Hetheland or Epiton, and derives its present name from the battle (usually called the battle of Hastings), fought on the heath between it and Hastings, on 14th Oct. 1066, when the Normans, under William the conqueror, final overthrew the Saxon dynasty in England. William, to commemorate his victory, founded in 1067, on the spot where Harold's standard was taken, a splendid abbey, which was endowed with all the land within a league of it. The abbey had the privileges of a sanctuary, and the conqueror's sword and a roll of his barons were deposited in it. The existing ruins, which belong to a building erected after the original abbey, occupy 3 sides of a quadrangle, and are a mile in circumference.

BATTLE is a combat between large masses of troops, or whole armies. Every B. ought to have for its object the determination, if possible, of the whole contest, or at least the effecting of some important step to that end. It is therefore the aim of a general to bring about an engagement at the decisive point. This constitutes strategy, while tactic is concerned with the handling of the troops in the actual battle. Victory on the battle-field is not enough for a general; it is only by following up his victory to the annihilation, if possible, of the beaten army, that its fruits are secured. ORDER OF BATTLE is the particular way in which the several corps of different arms are disposed for entering into an engagement. It varies at different times, and is modified according to locality.

No general account of a B. can be given. Information on the various elements of which a B. consists will be found described under such heads as ATTACK, ARTILLERY, CAVALRY, INFANTRY, CHARGE, FLEET, GUNNERY, TACTICS, etc. The more important individual battles will be found described, in their causes and results, under the names of the places with which they are associated.

Considered in their political relations, the importance of battles is not always in proportion to their magnitude. "There are some battles which claim our attention, independently of the moral worth of the combatants, on account of their enduring importance, and by reason of their practical influence on our own social and political condition, which we can trace up to the results of those engagements. They have for us an actual and abiding interest, both while we investigate the chain of causes and effects, by which they have helped to make us what we are; and also while we speculate on what we probably should have been, if any one of those battles had come to a different termination."—Prof. Creasy's *Fifteen Decisive Battles of the World, from Marathon to Waterloo.* The fifteen battles which, in prof. Creasy's opinion, have had the most decisive influence, are the following:

B.C.
490. Battle of Marathon.
413. Defeat of the Athenians at Syracuse.
331. Battle of Arbela.
207. " " the Metaurus.

A.D.
9. Defeat of the Romans under Varus.
451. Battle of Chalons.
732. " " Tours.
1066. Battle of Hastings.
1429. Joan of Arc's victory at Orleans.
1588. Defeat of the Spanish Armada.
1704. Battle of Blenheim.
1709. " " Pultowa.
1777. Defeat of Burgoyne at Saratoga.
1792. Battle of Valmy.
1815. " " Waterloo.

BATTLE, WAGER OF. See BATTEL.

BATTLE-AXE was a weapon much used by the early northern nations, Celtic and Scandinavian, requiring great strength in its use. Some were held with one hand, some with two; the former kind could be wielded equally by horse and foot, but the latter was for foot-soldiers only. The B. had a longer handle, and a broader, stronger, and sharper blade than the common axe. During the middle ages, and somewhat earlier, it was much used in sorties, and to prevent the escalading of a besieged fortress. The *pole-axe* differed but little from the battle-axe. The *black bill* and *brown bill* were a sort of halbert, having the cutting part hooked like a woodman's bill, with a spike projecting from the back, and another from the head. The *glaive* was a kind of pole-axe or bill used by the Welsh.

BATTLE CREEK, a city in Calhoun co., Mich., on Kalamazoo river, at the crossing of the Michigan Central and the Peninsular division of the Chicago and Lake Huron railroads; 121 m. w. of Detroit; pop. 5323; in '80, 7592. There are manufactures of flour, woolens, etc., and in the neighborhood are quarries of superior sandstone.

BATTLEMENT, a notched or indented parapet used in fortifications. The rising parts are called cops or merlons; the spaces by which they are separated, *crenels*, embrasures, and sometimes loops. The object of the device is to enable the soldier to shelter himself behind the merlon, whilst he shoots through the embrasure. The bas-reliefs of Nineveh, and the Egyptian paintings, testify to its antiquity, and there is perhaps no nation by which it has not been adopted.

BATTLE OF THE SPURS, the first important conflict between the burghers and the nobles at Courtrai, in 1302, the French nobility being utterly defeated. They rushed forward with loose reins and fell into a great ditch; their army was annihilated, and among the spoils were 4000 spurs of gold.

BATTLE-PIECES are paintings representing battles. The modern mode of warfare is less favorable for this branch of art than the ancient, where personal valor had more room to display itself. Among the greatest paintings of this kind are the battle of Constantine, sketched by Raphael, and executed by Giulio Romano; Lebrun's battles of Alexander; and the battle of the Amazons by Rubens. In smaller scenes, such as skirmishes and surprises, Antonio Tempesta, Hans Snelink, Pet. Snyders, Fulcone, Phil. Wouverman, etc., are distinguished. The most eminent of recent battle-painters is Horace Vernet.

BATTUE (from Fr. *battre*, to beat). The B. is a method of killing game on a great scale, by causing animals to be driven forward to a point where a number of shooters are waiting to shoot them. The driving is effected by beating the bushes; hence the term battue. This term, like the practice which it imports, is only of modern date; yet a plan of killing deer by driving them forward in herds in an ever-narrowing circle to a place where they are to be shot, is an old usage in the Highlands, where it is called the *tinchel*. The B. is at best a commonplace and butcherly amusement, for it can scarcely be said to have the merit of being attended with even a reasonable degree of exercise and excitement. It is practiced chiefly in extensive preserves of pheasants and hares during the autumn and winter months, when country gentlemen invite acquaintances to their mansions for the sake of field-sports. The B. takes place early in the day, and with good arrangements it is attended with neither fatigue nor danger. The number of shooters is usually eight or ten, each provided with at least two guns, which are loaded by an assistant as quickly as they are discharged. When the shooters are stationed at safe distances from each other, and ready to commence work, the beaters begin theirs by driving the game before them. Sometimes, however, pheasants will run a long way before rising on wing, and to make them take to flight on approaching the guns, a low net is stretched across their path. It should be stated, however, that in the B., hares, rabbits, etc., are shot as readily as pheasants; and at length the ground is covered with slain, like a field of battle. By means of the B., large quantities of game are killed, and sent to market; the profits derived from this species of stock on some estates amounting to no inconsiderable sum annually. For an account of battue shooting, we refer to *The Shot-gun and Sporting Rifle*, also *Stonehenge's British Rural Sports* (London, 1875).

BATTUS, founder of the Greek colony of Cyrene, in Libya, directed there by the Delphic oracle, about 650 B.C. He ruled 40 years and was succeeded by his son B. II., called "the prosperous," under whom the colony rapidly increased, land being given free to immigrants from Greece. The next of the Battiadæ on record was Arcesilaus II., about 554–44 B.C., who was defeated by the revolted Libyans, and strangled by his brother Learchus. The next heir, B. III., was lame; Demonax of Mantinea was the real ruler. The wife and son of the lame king, however, recovered the sovereignty, but the son, Arcesilaus III., was slain by fugitives from Cyrene while hiding from vengeance in Barca. The mother made war upon Barca and perpetrated great cruelties in revenge for the death of her son, but she soon after died miserably in Egypt. There followed a B. IV., and soon Arcesilaus IV., with whom the dynasty ended. The latter won a victory in chariot racing during the Pythian games, and was eulogized by Pindar

BATUM', or BATOUM', formerly a Turkish fortified city, now a Russian free port on the eastern shores of the Black sea. The Berlin congress of 1878, in sanctioning the cession of B. to Russia, stipulated that it should not be made into a naval station, but should remain an essentially commercial port. The harbor is one of the best on the e. coast of the Black sea. A pretty extensive trade is carried on. Hides, wax, honey, and, above all, oak for ship-building, are the principal exports. B. has about 3000 inhabitants, mostly Turks and Lasians, or Laz. Great ruins of Greek churches and other buildings are found in the neighborhood.

BATURIN, a t. of Russia, in the government of, and 78 m. e from, the city of Tchernigov, on the Seim. It was founded by Stephen Bathory, king of Poland, and was at one time the favorite residence of the hetmans of the Cossacks, of whom Mazeppa, who, in 1708, sold himself to the Swedes, is the most notorious. The palace of the hetmans, with its once beautiful grounds, is now going rapidly to decay.

BATU'TA, IBN (MOHAMMED-IBN-ABDALLAH), 1302–78; a Moor who traveled extensively in Asia and the eastern islands, Africa, and Spain. He wrote full observations, but only extracts or epitomes have been preserved.

BAUD, a t. of the dep. of Morbihan, France, situated on the Evel, 20 m. n.w. from Vannes. Pop. 76, 1496. B. has some trade in grain, cattle, hemp, butter, and honey. Near B. is a statue of granite, known as the "Venus of Quinipily," worthless as a work of art, but remarkable on account of its history. Its origin is unknown, but it is supposed, from its Egyptian character, to be a Gallic Isis. Down to the 17th c., it was worshiped with foul rites, and even now is regarded with superstitious veneration by the peasantry. It appears to have been first called Venus in inscriptions on the pedestal set up in 1689.

BAU'DEKYN, a corruption of Baldachin (q.v.).

BAUDELAIRE, CHARLES, 1821–67; a French poet, one of the curious class now known as "Bohemians." Some of his writings are gross, while some, especially his little poems, are very beautiful; but nearly all are in the romantic, or rather ecstatic, vein of affectation peculiar to writers of intolerable egotism. The only work of B.'s which has a living power is his translation of the writings of Edgar Allan Poe, which is pronounced one of the most brilliant and faithful translations of the age.

BAUDELOCQUE, JEAN LOUIS, 1746–1810; a French surgeon, especially devoted to obstetrics, in which he gained great reputation. He was one of the earliest to use forceps in difficult parturition. Napoleon selected B. to attend on the confinement of Maria Louisa.

BAUDRILLART, HENRI JOSEPH LÉON, b. Paris, 1821; a political economist and author, editor of the *Journal des Economistes*, and connected with *Des Debats*, being son-in-law of the editor. In 1866, he was appointed professor of history and political economy in the college of France. He has written many works, chiefly upon his favorite themes of political economy.

BAU'ER, BERNARD, of a Jewish family, b. Hungary, 1829; served in the French army and became a convert to Roman Catholicism, joining the Carmelites. He was chaplain at the Tuileries, and a special favorite of the empress Eugenie. During the siege of Paris he was chaplain of the ambulances of the press. His lectures and some political pamphlets are published.

BAU'ER, BRUNO, a celebrated biblical critic and philosopher, belonging to the extreme school of German rationalism, was b. at Eisenberg, in the duchy of Saxe-Altenburg, on the 6th Sept. 1809. He is the son of a porcelain-painter, and studied at the university of Berlin, where he became doctor of theology in 1834. From this period he has devoted himself exclusively to what is termed in Germany the scientific criticism of Scripture—that is to say, a criticism based on the conviction, that the contents of the Bible have a natural, and not a supernatural origin, and ought to be subjected to the same process of philosophical analysis as other human productions are. In 1839, B. became a *privat-docent* in the university of Bonn, but in 1842 was forbidden to deliver any more theological lectures. He then removed to Berlin, where he has since resided. He has passed through various stages of anti-supernaturalism. At first, he contented himself with believing that the substance of the Christian religion might be extricated from the entanglements of a confused and erroneous system of interpretation. Such is the idea that runs through his earliest works, his *Criticism of Strauss' Life of Jesus*, published in the Berlin *Year-book of Scientific Criticism* (1835–36), his *Journal of Speculative Theology* (1836–38), and his *Critical Exposition of the Religion of the Old Testament* (Berlin, 1838). He soon, however, advanced so far in his "scientific" demands, that it became quite clear the Scriptures, in his eyes, had lost even the moderate authority which he originally supposed them to possess. To this period belong his *Doctor Hengstenberg*, (Berlin, 1839), and *The Evangelical Church of Prussia and Science* (Leip. 1840). In the former of these works, B. appears as an opponent of the school of apologetic theologians, and exposes what he conceives to be the weakness of their system as a method of apprehending characteristic differences in the historical development of Christian doctrine; in the latter, he wished to prove that true philosophic union is the dissolution of the outward dogmatic

church in the realm of the universal and free self-consciousness—language which is not very intelligible to the finite Anglo-Saxon mind. In his *Critique of the Evangelical History of John* (Brem. 1840), and *Critique of the Evangelical Synopticists* (Leip. 1840), he attempted to show that the so-called facts of the gospel never really had a historical existence, and that those artistic compositions which we term the gospels, were simply the product of the human self-consciousness. B. considers Strauss, a mere apologetical theologian, a comparatively orthodox writer! and regards his conclusions with the supercilious contempt of one who has reached a far higher elevation, while he conceives that his own special work in this world has been to strike off the last head of the hydra of the tradition-hypothesis. The persecutions to which he was now subjected brought about a complete rupture between him and the church, the consequence of which was a brochure entitled *The Question of Liberty, and my own Private Affairs* (Zurich, 1843). Then followed his *Christianity Unveiled* (Zurich, 1843), in which he expressed the same conviction that he had previously done in two ironical treatises—viz., that a dogmatic religion was opposed to our self-consciousness. About this time he broke with his old friends, the liberals, by writing a pamphlet against the emancipation of the Jews, *Die Judenfrage* (Brunswick, 1843). This tractate forms the transition point to the third period of B.'s intellectual activity, in which he seems to have abandoned theology altogether as something hopeless. He now occupied himself exclusively with literature and political philosophy. The number of his writings in this department is very great. The principal are, *History of the Politics, Civilization, and Enlightenment of the 18th Century* (Charlottenburg, 1843–45); *History of Germany during the French Revolution and the Reign of Napoleon* (Charlottenburg, 1846); *History of the French Revolution until the Establishment of the Republic* (Leip. 1847); *Western Dictatorship; The Actual Position of Russia; Germany and Russia; Russia and England.* The prominent idea in the whole of his works belonging to this period is, that the failure of the popular and national struggles in the 19th c. results from the essential weakness of the "enlightenment" of the 18th century. More lately B. has again returned to theology. In 1850–51, appeared his *Critique of the Gospels and the History of their Origin*, and his *Critique of the Epistles of St. Paul*, the latter of which the author considers wholly apocryphal, and written during the 2d century. Besides the works mentioned, B. has composed various other treatises on important points of history, theology, and politics. All B.'s writings exhibit great learning, industry, research, and acumen; but are completely antagonistic to the received opinions in theology, or to any form of evangelical religion. He is generally admitted to be quicker in the discovery of error than of truth. His latest work is *Philo, Strauss, Renan, und das Urchristenthum* (1874).

BAU'ER, GEORG LORENZ, 1755–1806; a German theologian who taught that the Bible, like the old classics, must be interpreted by historical and grammatical lights, and not with regard to religious doctrines. He was the first to write a systematic exposition of the Christian dogmas as they are contained in the Bible, and in each book in particular. He was an accomplished oriental scholar, translating much from the Arabic and other eastern tongues.

BAUGÉ, a t. in the department of Maine-et-Loire, France, 23 m. e.n.e. of Angers. The English, under the duke of Clarence, were defeated here in 1421. Pop. '76, 3318, who are engaged in the manufacture of linens and woolens.

BAUHIN, GASPARD, 1560–1624; a French physician and botanist, b. in Switzerland; professor of anatomy and botany in the university of Basel in 1588, afterwards rector and dean of the faculty. His works on botany, catalogues, etc., were better than others of his time, and a work of his on anatomy is commendable.

BAUHIN, JEAN, 1541–1613; brother of Gaspard, a student of the botanist Fuchs and companion of Gesner in collecting plants. He also practiced medicine, and in his later life was physician to the duke of Würtemburg. He wrote a work on the medicinal waters of Europe; but his great work on plants was left unfinished. B. is considered one of the founders of botanical science.

BAUHIN'IA, a genus of plants of the natural order, *leguminosæ*, sub-order *cæsalpineæ*. The upper petal is somewhat remote from the rest. The leaves are generally divided into two lobes. The species are natives of the warmer regions of both hemispheres, and some of them are remarkable for the size and beauty of their flowers. Most of them are twining plants or *lianas*, stretching from tree to tree in the tropical forests; but some are small trees, as *B. porrecta*, the mountain ebony of Jamaica, so called from the color of its wood. The inner bark of *B. racemosa* (the Maloo climber), of *B. scandens*, and of *B. parviflora*, East Indian species, is employed for making ropes. *B. retusa* and *B. emarginata*, also East Indian, exude a brownish colored mild gum; whilst the astringent bark of *B. variegata* is used in Malabar for tanning and dyeing leather, and also in medicine. The leaves of various species are used in Brazil as demulcent medicines, having mucilaginous properties—Livingstone mentions a species of B. in s. Africa, called the mopané tree. It is remarkable for the little shade which its leaves afford. They fold together and stand nearly erect during the heat of the day. On them the larvæ of a species of *psylla* cause a saccharine secretion, in circular patches, beneath which the pupa of the insect is found. The natives scrape it off and eat it as a dainty.

BAUMÉ, ANTOINE, 1728–1804; a French chemist, distinguished for success in the practical application of the science. He became a professor in the college of pharmacy, kept a large establishment for the preparation of drugs, and published many papers on chemistry, and arts and manufactures. Among his inventions and improvements were a process to bleach raw silk, the manufacturing of sal ammoniac, of improved scarlet dyes, and a cheap process for purifying saltpeter. He published several works on his favorite theme of chemistry. He made for the areometer a scale which is still used.

BAUMGAR'TEN, ALEXANDER GOTTLIEB, a clear and acute thinker of the school of Wolf, was b. at Berlin on the 17th of July, 1714, studied at Halle, and in 1740 became professor of philosophy at Frankfort-on-the-Oder, where he died on the 26th of May, 1762. He is the founder of æsthetics (q.v.) as a systematic science of the beautiful, though his mode of treatment is objected to by the more transcendental Germans, as being purely psychological; that is to say, he makes æsthetics only a portion of the philosophy of the senses, and contrasts it with logic, which belongs to the sphere of the reason. The idea of a science of the beautiful first appears in his treatise, *De Nonnullis ad Poema Pertinentibus*, published at Halle, 1735. In 1750–58, he issued two volumes of his *Æsthetica*, but his death hindered the completion of the work. His writings in other departments of philosophy are marked by clearness and precision; his *Metaphysica* (Halle, 1739; 7th edition, 1779) is still considered one of the most useful books for the study of the Wolfian philosophy.

BAUMGARTEN, MICHAEL, b. 1812; a German theologian; studied at Kiel, became professor at Rostock, and a prominent and energetic defender of the Protestant association.

BAUMGARTEN-CRUSIUS, LUDWIG FRIEDRICH OTTO, a German theologian, b. at Merseburg, 1788, and d. at Jena, 31st May, 1843. He studied theology at Leipsic, and in 1810 became university preacher. In 1817, he was appointed professor of theology at Jena, and always distinguished himself as a champion of religious liberty, on behalf of which he wrote various treatises. In 1820 appeared his *Introduction to the Study of Dogmatics* (Leip. 1820), a work of considerable originality and richness of thought. More complete exhibitions of his opinions are to be found in his *Manual of Christian Ethics* (Leip., 1827); *Outlines of Biblical Theology* (Jena, 1828); and *Outlines of Protestant Dogmatics* (Jena, 1830). In 1831–32, he published a *Text-book of the History of Doctrines;* in 1834, a work on *Schleiermacher, his Method of Thought, and his Value;* and also *Considerations on certain Writings of Lamennais.* After his death, Kimmel published the whole of his exegetical prelections on the gospels and Pauline epistles.

Baumgarten was conspicuous for the breadth and solidity of his learning, the originality of his spirit, and the acuteness of his understanding, but was nevertheless deficient in clear and vivid expression. He attached himself to no school, theological or philosophical. At an early period, he had been greatly influenced by the metaphysics of Schelling, from which, however, he ultimately emancipated himself. His thinking was, to a certain extent, rationalistic, but on the whole approached more closely to the direction of the spiritual Schleiermacher.

BAUMGARTNER, ANDREAS RITTER VON, or Chevalier de, was b. at Friedberg, in Bohemia, 23d Nov., 1793, and studied at Vienna, where, in 1823, he became professor of natural philosophy. Whilst filling this office, he gave popular lectures on Sundays upon mechanics, etc., for artisans and operatives, which met with much approbation. A result of these lectures was his *Mechanik in ihrer Anwendung auf Künste und Gewerbe* (2d ed., Vienna, 1823), and his *Naturlehre* (Vienna, 1823). An ailment of the throat induced him to resign his professorship, but he was appointed director of the imperial porcelain, mirror-glass, and smalt manufactories, and afterwards superintendent of tobacco manufactories. In the year 1846, the setting up of the electric telegraph was committed to him, and he was intrusted with the principal charge of the making of the Austrian railways. After the events of Mar., 1848, he was minister of mines and of public buildings, and chief of one of the departments in the ministry of finance. In May, 1851, he was appointed minister of commerce, trade, and public buildings. At the same time, he was appointed president of the Austrian academy of sciences, of which he had been vice-president for a number of years. He published, in 1862, *Chemie und Geschicte der himmelskörper nach de Spectral-analyse;* in 1864, *Die mechan. Theorie der Wärme.* He d. in 1865; and *Freiherr Von B., Eine Lebensskizze*, was published during the following year.

BAUMGARTNER, GALLUS JAKOB, 1797–1869; a politician and historian of Switzerland, the son of a mechanic. He studied law, and was a leader of the liberals, but afterwards associated with the ultramontanes. He has been a member of a number of legislative bodies.

BAUPET'TAH, a t. of British India, in the presidency of Madras, 29 m. from Guntoor. Pop. supposed to be about 20,000.

BAUR, FERDINAND CHRISTIAN, the founder of the "New Tübingen School of Theology," was b. on the 21st of June, 1792. In 1817, he became professor in the seminary of Blaubeuren, where he gave the first indications of his remarkable abilities by the publication of his *Symbolism and Mythology, or the Nature-religion of the Ancients* (Stuttgart, 3

vols., 1824–25), a work which indicates the influence of Schleiermacher over the author. In 1826, he was called to Tübingen, where he held the chair of Protestant theology. His whole life was consecrated to religious studies—the history of doctrines, the symbolism of the church, and biblical exegesis. On account of the universality of his culture, the wonderful activity and fertility of his mind, his rare combination of speculative thought with solid knowledge, and that faculty of historic divination or insight which enabled him to draw decisive results from separate, obscure, and neglected *data*—he has been regarded by many in Germany as the most massive theological intellect since Schleiermacher. Unlike Bruno Bauer, he made comparatively little use of the Hegelian philosophy in his writings; and when he did, it was professedly only that he might more clearly understand historical phenomena in their internal spiritual connection, and be enabled to represent the logical process of their development. His method of investigating the progressive history of religious opinion, however, incurred the reproach of formalism from its adversaries, who said that he applied it too rigorously, and made dogmas develop themselves with a kind of abstract inevitable regularity from previous historical conditions, without allowing for immediate and extraordinary providences. His most important works in the history of doctrine are *Die christliche Gnosis oder die christliche Religionsphilosophie* (Tübingen, 1835), (The Christian Gnosis, or the Christian Philosophy of Religion); a work which makes the Christian Gnosis of the 2d and 3d centuries the starting-point of a long series of religio-philosophical productions traceable uninterruptedly down through middle-age mysticism and theosophy to Schelling, Hegel, and Schleiermacher; *Die christliche Lehre von der Versöhnung* (Tübingen, 1838), (The Christian Doctrine of the Atonement); and *Die christliche Lehre von der Dreieinigkeit und Menschwerdung Gottes* (Tübingen, 1841–43), (The Christian Doctrine of the Trinity and the Incarnation). In reply to Möhler, the celebrated Roman Catholic theologian, who had attacked the Protestant church, he wrote *Der Gegensatz des Catholicismus und Protestantismus* (Tübingen, 1836), (The Opposition between Catholicism and Protestantism). Besides these works, based on a historical treatment of religion, to which class also belongs his *Lehrbuch der christlichen Dogmengeschichte* (Compendium of the History of Christian Dogmas), (Stuttgart, 1847), he published various critical treatises on parts of the New Testament; such as *Die Christuspartei in der Korinthischen Gemeinde; der Gegensatz des Paulinischen und Petrinischen Christenthums; der Apostel Petrus in Rom* (1831), (The Christ-party in the Corinthian Community; the Opposition of the Pauline and Petrine Christianity; the Apostle Peter in Rome), a work in which the author endeavors to demonstrate the existence of deep-rooted differences in that sphere of primitive Christianity, in which we are accustomed to see nothing but unity and harmony. His inquiries concerning the Gnosis led him to study minutely the pastoral epistles, the result of which study was *Die sogenanten Pastoralbriefe des Apostels Paulus* (Stuttgart, 1835), (The So-called Pastoral Epistles of the Apostle Paul), in which he combats the idea that St. Paul was their author, and refers them to the 2d century. Of a similar nature is his *Paulus, der Apostel Jesu Christi* (Stuttgart, 1845), (Paul, the Apostle of Jesus Christ). His work on the Gospel of John produced a startling effect, as up to B.'s time that gospel had generally been held prior in date to the three synoptic gospels, whereas B. strove hard to show that it was of post-apostolic origin. In 1847, appeared his *Kritische Untersuchungen über die canonischen Evangelien, ihr Verhältniss zueinander, ihren Ursprung und Charakter* (Critical Inquiry Concerning the Canonical Gospels; their Relation to each other; their Origin and Character). In 1851, he published *Das Markus-evangelium nach seinem Ursprung und Charakter* (The Origin and Character of St. Mark's Gospel). B. died Dec., 1860. In these and other works of a similar nature, B. maintained that we must extend our notions of the time within which the canonical writings were composed to a period considerably post-apostolic, and which can only be determined approximately by a careful investigation of the motives which apparently actuated their authors. The chief characteristic, therefore, of the "Tübingen School," as exhibited in the works of its founder, is the union of a subjective criticism with a strong conviction of the historic reality of the New Testament writings. The most distinguished adherents of this new school of German theology are Zeller, Schwegler, Köstlin, and Hilgenfeld.

BAUTAIN, Louis-Eugene-Marie, a French philosopher and theologian, b. at Paris, Feb. 17, 1796. He studied under Cousin at the normal school. In 1816, he was appointed professor of philosophy in the college of Strasbourg, and soon distinguished himself by the influence he exerted over the earnest youth of that city, who carried their admiration even to the length of imitating his walk and dress. The religious tendencies of his character, however, not finding a satisfactory expression in philosophy, he threw himself into the arms of the church, and became a priest in 1828. After the events of 1830, he resigned his professorship, which until then he had retained; but his reputation for orthodoxy, never very strong, had been destroyed in the eyes of his bishop by his work *La Morale de l' Evangile comparée à la Morale des Philosophes*, published a few years before, and he was in consequence suspended from sacred offices for several years, but reinstated in 1841. In 1838, he was made dean of the faculty of letters at Strasbourg, and afterwards director of the college of Juilly. At a still later period, he was translated to Paris, and appointed vicar-gen. of the metropolitan diocese. In 1848, he attempted

to give a religious direction to the revolution. He was selected as one of the professors of the theological faculty of Paris, and was an extremely popular preacher. His principal works are *Philosophie-psychologie Expérimentale* (1839), *Philosophie Morale* (1842), *Philosophie du Christianisme* (1835), *La Religion et la Liberté considérées dans leurs Rapports* (1848), *La Morale de l'Evangile comparée aux divers Systèmes de Morale* (1855). He died in 1857.

BAUTZEN, or, in official language, BU'DISSIN, capital of the circle of the same name, kingdom of Saxony: It has a pop. (1875) of 14,709, including many *Wends*, remnants of the old Vandals. It is situated on a rising ground overlooking the river Spree, and is the seat of the chief offices of justice in the circle, which has a pop. (1875) of 339,203, including 50,000 Wends. It has several churches, a royal palace—formerly the residence of the markgrafs of Meissen—numerous schools, and two public libraries and hospital. The chief branches of industry are manufactures of woolens, fustian, linen, hosiery, leather, and gunpowder. B. is a place of considerable antiquity, and was known in the time of Henry I. (931), but was first made a town under Otho I. Its several privileges, and the reputation of certain holy relics preserved in St. Peter's church, made the place important. It suffered greatly in the war with the Hussites, and still more during the thirty years' war. Meissner, the poet, who died in 1805, was born here. B., however, is chiefly celebrated as the place where Napoleon, with an army of 150,000 men, after an obstinate resistance, won a barren victory over 90,000 of the allied Russians and Prussians, May 20–21, 1813. The allies lost in the two days 15,000 in killed and wounded; in addition to 1500 prisoners, mostly wounded, which the French captured. The French left 5000 dead upon the field, and upwards of 20,000 were wounded. The result of the battle, and the splendid retreat of the allies, were most disheartening to the French army, and even to Napoleon himself.

BAVA'RIA (Ger. *Baiern*, and officially, *Bayern*), one of the states of the German empire; according to its size, the second in importance. B. is divided into two unequal parts, which are separated by the Baden and Hesse-Darmstadt dominions. The eastern portion, comprising fully eleven twelfths of the whole, is situated between lat. 47° 20′, and 50° 41′ n., and long. 9° and 13° 48′ east. It is bounded n. by the Prussian province of Hesse-Nassau, the Thuringian principalities, and the kingdom of Saxony; e., by Bohemia and Austria; s., by the Tyrol; and w., by Würtemburg, Baden, and the grand duchy of Hesse. The western part, occupying the Rhine Palatinate, on the left bank of the Rhine, lies between lat. 48° 57′ and 49° 50′ n., and between 7° 5′ and 8° 27′ east. Rhenish Prussia, the grand duchy of Hesse, and Baden bound it on the w., n., and e., and France on the south.

B. is divided into eight circles, as follows:

Circles.	Area in sq. miles.	Pop. in 1875.
Upper Bavaria	6,535	894,404
Lower Bavaria	4,091	622,377
Palatinate	2,272	641,567
Upper Palatinate	3,679	503,422
Upper Franconia	2,632	555,043
Middle Franconia	2,914	607,085
Lower Franconia	3,409	597,056
Swabia and Neuburg	3,648	601,950
Total	29,180	5,022,904

At the census of 1871 the pop. was 4,863,450.

Surface, Hydrography, Railways, etc.—B. may be described as a mountainous country. It is walled in on the s.e., n.e., and n.w. by mountains ranging from 3000 ft. to close on 10,000 ft. in height. The highest elevation is reached on the s., the Zugspitz of the Noric Alps being 9665 ft. high. On the e., the highest points of the Böhmerwald, dividing B. from Böhemia, are the Arber and Rachelberg, which are respectively 4613 ft. and 4800 ft. high. On the n.e., the Schneeberg, in the Fichtelgebirge range, attains a height of 3481 feet. A branch of this chain, which is connected on the n.w. with the Thuringerwald, extends s. between the rivers Regnitz and Vils. The Rhöngebirge, the greatest height of which is 3000 ft., forms the northernmost chain of Bavaria. In the Rhine palatinate, the principal mountain is the Hardt, whose culminating peak is about 2300 ft. high. In the interior, B. is intersected in several directions by various less elevated ranges, alternating with extensive plains and fertile valleys. B. is rich in wood, nearly one third of its surface being covered with forests, mostly of pine and fir.

As to its *hydrography*, B. has the Rhine flowing along the whole eastern boundary of the circle of the palatinate, which is also watered by the Speyer, the Lauter, and the Queich. The Danube enters B. proper at Ulm, where it is joined by the Iller, and pursues its course in an e.n.e. direction through the center of the country, until it passes out at Passau into the Austrian dominions. Including its windings, the length of the Danube in B. is about 270 m., which can be navigated throughout. In its passage through B., it receives no fewer than 38 rivers, the chief of which, on the right bank,

are, besides the Iller, already mentioned, the Lech, the Isar, and the Inn; and on the left, the Wörnitz, the Altmühl, the Kocher, the Naab, the Regen, and the Ilz. The n. part of B. is in the basin of the Main, which, rising in the north, flows with many windings through the kingdom in a s.w. direction to the Rhine, with which it unites at Mayence. Its most important tributaries are the Regnitz, the Rodach, the Tauber, and the Saale. B. has several lakes, the principal of which are the Chiem, which has a circumference of 35 m.; the Wurm, with a length of 14 m., and a breadth of 4 m.; and the Ammer, with a circuit of 27 miles. These lakes are situated in the south, at the foot of the northern slope of the Noric Alps. A corner of lake Constance also belongs to Bavaria. The lakes and rivers abound in fish. There are a few canals in the country, the most important of which is the *Ludwigs-Kanal*, which, taking advantage of the rivers Main, Regnitz, and Altmühl, unites the Rhine and Danube, and, through them, the German ocean with the Black sea. This canal was executed by government at a cost of upwards of £800,000. B. has altogether about 1700 m. of railway in operation. One of the chief is that between Augsburg and Lindau on lake Constance, a distance of 80 miles. These lines join Munich with Augsburg, Donauwörth, Nürnberg, Bamberg, Ulm, Kufstein, etc. B. has about 9000 m. of public roads, and over 1500 of telegraphs.

Climate, Soil, Products, etc.—The temperature of B. varies considerabiy, being cold and bleak in the mountainous regions, and very hot in summer in the plains and valleys. The climate may be described generally, however, as mild and salubrious. The soil, particularly in the valleys of the upper and lower Danube, is very fertile, second to none in central Germany; but its capabilities as yet have not been fully developed, although even now the wealth of the country consists almost wholly of its agricultural produce. The plain s. of Munich has been described as the granary of Germany, in consequence of its great productiveness, while the circles of upper and middle Franconia are styled the hop-garden of Bavaria. Wheat, rye, oats, and barley are the chief articles of produce, but buckwheat, maize, and rice are also grown to a small extent The vine, as well as the hop-plant, is cultivated extensively in Franconia, and the wine is held in great esteem. Rhenish B. also produces good wine. The quantity annually produced in B. is estimated at upwards of 16,000,000 gallons. Fruit, tobacco, flax, hemp, linseed, licorice, and beet-root are cultivated. Cattle-rearing forms the exclusive occupation of the inhabitants on the slopes and at the foot of the Alps, pasturage being found at an elevation of 8500 feet. Sheep, goats, and pigs are reared in middle and upper Franconia, and horses chiefly in upper B. and Swabia, but the live-stock is far from being adequate to the extent and capacity of the country. The forests of B. annually furnish large quantities of timber. The soil is rich in mineral wealth, which as yet has not been drawn upon to anything like its full extent. The chief minerals are salt—which is a government monopoly, and obtained by evaporation, principally from the rich mines in the s.e. corner of the Alps—coal and iron, which is worked almost everywhere throughout the territory. In Rhenish B., copper, manganese, mercury, and cobalt are found; quicksilver and black-lead are obtained in some places; marble in great variety is common, so also are gypsum, alabaster, and some of the finest porcelain clay in Europe.

Manufactures, etc.—The manufacturing industry of B., like its agriculture, is generally in an undeveloped state, and not centered in the hands of capitalists, who can largely take advantage of new inventions to prosecute it with energy and success, but distributed among numerous small manufacturers.

This is not the case with beer, the manufacture of which is carried to great perfection in B., and to an extent, if we take population into account, quite unparalleled in Europe. There are upwards of 5000 breweries in B., making about 110,000,000 gallons of beer annually, which are mainly consumed in the country, the quantity of beer that a Bavarian can imbibe being quite marvelous. Nearly two thirds of the revenue of the state are said to be derived from this source alone. Next to beer, coarse linen is the most important product of manufacturing industry, and of late years some considerable cotton-factories have been erected; but the supply of cotton, woolen, and worsted goods is not equal to the home consumption. Leather is pretty extensively manufactured, so also are paper, articles of straw and wood, porcelain, glass, nails, needles, jewelry, beet-root sugar, and tobacco. The mathematical and optical instruments of Munich are held in high repute. The exports consist of timber, grain, wine, cattle, wool, salt, hops, fruits, beer, leather, glass, jewelry, optical and mathematical instruments, butter, cheese, etc. The annual value of these is estimated at about £1,500,000. The principal imports are sugar, coffee, woolens, silks, stuffs, drugs, hemp, and flax. The position of B. gives it the transit trade between n. Germany and Austria, Switzerland and Italy.

Population, Religion, Education.—The growth of the population of B. is much checked by the regulations which relate to marriages. No marriage can take place until the authorities who superintend the relief of the poor are fully satisfied that the persons wishing to marry have adequate means to support a wife and family; and certain military obligations have also to be fulfilled before a man can enter into wedlock. These restrictive laws have another consequence besides that of preventing a rapid increase of the population; they have tended to increase inordinately the number of illegitimate children. B. has a very bad pre-eminence in this respect on the continent. In the capital, the illegitimate births about equal the legitimate; and over the whole

kingdom the proportion ranges from 1 in 4.5 to 1 in 5 of the total births, equal to a percentage of from 22¼ to 20 illegitimate births. In 1817, the population was 3,564,757; in 1833, 4,187,390; and in 1805, it had only increased to 4,541,556. During recent years, however, the increase has been more rapid, the population in 1864 amounting to 4,807,440; and in 1871, to 4,863,450. The Bavarians, notwithstanding their beer-bibbing propensity, are essentially a sober and industrious people. Though all of German origin, they differ materially in character. The Franconians are intelligent, diligent, and steady; the Suabians, good-naturedly indolent; and the inhabitants of the Palatinate, lively and enterprising; while the Bavarians proper are dull and superstitious.

As to *religion*, in 1871, the Roman Catholics numbered 3,464,364; Protestants, 1,342,592; Jews, 50,662; and other minor sects, 5453. The state allows perfect toleration, guaranteeing the same civil rights to Catholic and Protestant alike. Individuals of every sect have the privilege of worshiping privately without fear of molestation; and on application to the king by a sufficient number of families, the right of public worship can be secured. A concordat with Rome divides the state into 2 archbishoprics and 6 bishoprics. The consistories of Anspach, Baireuth, and Speyer, under the superior consistory of Munich, govern the Lutheran church, the Munich consistory being in some degree subject to a section in the home department, which manages the temporal concerns of all the churches. The president of the Munich consistory has a seat and vote in the council of the state. The revenues of the church of Rome are derived from lands and endowments, the Protestant church is supported by the state. Of late, the Bavarian government has become conspicuous by opposing the Ultramontanes, and encouraging the "Old Catholics."

B. has a good system of *education*, under the supreme direction of a minister of public instruction, to whom certain members of the provincial governments, specially instructed to watch the educational interests of the communities, are subordinate. They, again, have numerous inspectors under them, who make systematic reports. Nevertheless, in upper and lower B., about one fifth of the children are yet without a school education. Besides elementary schools, there are about 30 *gymnasia*, and numerous Realschulen and technical schools of various kinds. The three Bavarian universities are at Munich, Würzburg, and Erlangen, the latter being Protestant. There are several extensive libraries in B., that of Munich being the largest in Germany. Art has been zealously cultivated in B., and since the days of king Louis I. has been peculiarly fostered by the state. There are numerous institutions for the furtherance of painting, sculpture, and music.

Government, Revenue, etc.—B. is a constitutional monarchy, the throne hereditary in the male line. Its constitution dates no further back than 1818, when it was declared a part of confederated Germany. The king is the executive. The legislature consists of a chamber of senators, and one of deputies. The senators are hereditary, the king, however, having the power, within certain limits, to nominate members for life. The chamber of deputies consists of five different classes—one eighth of the whole members being chosen from landed proprietors, who exercise judicial powers in right of their property, and have no seat in the upper house; another eighth from ecclesiastics of the Protestant and Roman Catholic churches; a fourth from the inhabitants of cities and market towns; and a half from landed proprietors who neither possess judicial rights, nor a seat in the other chamber. There are, besides, three members from the universities—one from each. There is one member in the chamber of deputies for every 7000 families, or 35,000 inhabitants. In the event of there not being a dissolution, the chamber lasts for six years. The usual length of the annual session is two months. The chambers, in ordinary circumstances, meet once a year for the dispatch of business, and it is compulsory on the king to summon them once in three years. No deliberation can take place unless two thirds of the deputies are present. All matters relating to public burdens, etc., come first under the consideration of the chamber of deputies; with reference to other questions, the king exercises his own discretion as to which chamber shall first discuss them. No alteration in taxation, and no new law, can be promulgated without the consent of the legislature; but the royal prerogative is loosely defined.

The cabinet consists of seven members, chiefs of the departments of foreign affairs, justice, home affairs, public worship and instruction, finance, commerce, and public works and war. They are not necessarily members of the chambers, though they are privileged to be present at the deliberations. The privy council is composed of the king, certain royal princes, the ministers of state, and six councilors nominated by the king.

The *revenue* of B. for 1876–77 amounted to 258,686,781 marks (£12,934,324), of which 20,296,453 marks were to be raised by direct taxation, 39,062,210 marks by indirect taxation, the rest chiefly from domains and state monopolies. The expenditure for the same year was estimated at the same figure. The interest on the national debt swallows up about 15 per cent of the whole expenditure; the army, 18 per cent; and worship and education about 11 per cent. In 1876, the public debt amounted to 1,108,954,854 marks (£55,447,742), 398,345,143 marks being contracted for railways. In 1858, the public debt was 122,839,495 florins, and the debt on railways was 88,643,834 florins—total, £17,623,629.

The raising of the *army* of B. was in 1871 adapted to the Prussian method of con-

scription. Every Bavarian is liable to service for seven years, and no substitution is allowed. The period of active service is four years, the remaining three being spent in the army of reserve; and the soldier, after quitting the reserve, is bound to serve other five years in the landwehr. When B., in Nov., 1870, became one of the kingdoms of the German empire, her army, on the established conditions of its formation, was formed into two corps of the imperial army, each consisting of two divisions, under the command of the king of B. in times of peace, but controlled by the emperor of Germany in war. On the peace-footing, the infantry consists of 16 regiments, 48 battalions, 26,638 men in all; besides which there are 10 battalions of chasseurs, 5510 strong, and 32 battalions of landwehr. There are 10 regiments of cavalry, of 7192 men; 5544 artillery, 1214 engineers, and 1126 of the military train—in all, 47,224 men, without including the *landwehr*. In time of war the total force is 149,892, rather more than trebled.

History.—The Boii, a race of Celtic origin, were the first inhabitants of B. of whom tradition furnishes any account. From them, its German name, Baiern, as well as its old Latin name, Boiaria, is said to have been derived. They appear to have conquered the country about 600 B.C., and they retained it until, shortly before the Christian era, when they were subjugated by the Romans; the country being made an integral part of the Roman empire, under the names of Vindelicia and Noricum. After the decay of the Roman power, the Ostrogoths and Franks successively held possession of it, until Charlemagne conquered it. After his death, it was governed by lieutenants of the Frank and German kings, until 1070, when it passed into possession of the Guelph family; and it was transferred by imperial grant, in 1180, to Otho, count of Wittelsbach, whose descendant now occupies the throne. The Rhenish Palatinate was conferred on this family by the emperor Frederick III. in 1216. Now followed quarrels between relatives, and divisions of territory, until the dukedom of B. was severed from the Rhenish and upper Palatinates (see PALATINATE); of the latter, however, it repossessed itself in 1621—the peace of Westphalia, in 1648, confirming the title of its princes to that possession, as well as its right to the electoral dignity to which it had been raised in 1624. In the war of the Spanish succession, B. supported France, and suffered considerably in consequence; but in 1777, on the extinction of the younger Wittelsbach line, it received the accession of the Rhine Palatinate. In 1805, B. was erected into a kingdom by Napoleon I. The king assisted Napoleon in his wars, and in consideration of his aid received large additions of territory. In 1813, however, the Bavarian king opportunely contrived to change sides, and thus managed to have confirmed to him, by the treaties of 1814–15, an extent of territory nearly as valuable as the possessions which the treaties of Presburg and Vienna had given him, and which he had now to restore to Austria.

In 1818, as already intimated, the new constitution came into existence, but owing to various causes, it did not secure that measure of popular freedom and contentment that had been expected. In 1825, Louis I. ascended the throne. He was a well-meaning, liberal, and intellectual monarch, and was favorable to the liberty of the people and the press; but he lavished the wealth of the kingdom to an extravagant degree on the embellishment of the capital, and on works of art, while he neglected to a considerable extent works of practical value, that would have tended to enrich the country, diminish the public burdens, and consequently increase the welfare of his people. In 1830, a wave from the French revolution swept over the country, disturbing its equanimity, but not to any serious extent. The Bavarian government, however, took alarm, and restricted the freedom of the press. These restrictions excited so much opposition, that they were soon after rescinded, but new dissatisfaction was created by the imposition of new taxes. The Jesuits now obtained an immense influence with the king, which they used to the detriment of popular rights. The wrath of the people was further aroused against their monarch by his connection with the notorious Lola Montez, who was looked upon as an agent of the Ultramontanists—an imputation which that lady, in her autobiography, published in 1858, indignantly repudiates, maintaining that she was the inveterate enemy of that party, and the true friend of the people. In March, 1848, following the example set by the French revolutionists, the people of Munich seized the arsenal, and demanded reforms and the expulsion of Lola Montez. The king had to consent; but in the same month he abdicated his throne, in accordance, says Lola Montez, with a promise made by him to her. His son, Maximilian II., ascended the throne. He died in 1864; and Louis II., a distinguished patron of Wagner, the great musician, now reigns. See GERMANY.

BAVARIA, a colossal female statue at Munich, which bears the name of the country of which it is a personification, is said to be second in size only to the famous Colossus of Rhodes. It was erected by king Louis I., the model having been executed by Schwanthaler. Externally, the figure bears a German aspect. A long folding garment reaches from the middle to the naked foot; over the half-naked breast a skin is cast, and the hair falls freely over the back. The brow is adorned with sprigs of oak; in the left hand, which is raised, she holds a wreath of oak; and in the right, which is bent towards the breast, a sword; at her side reposes the Bavarian lion, the guardian of her kingdom, in a sitting attitude. The statue is 65 ft. high, the pedestal being 30, so that the whole monument has a height of 95 feet. The statue was cast from the bronze of Turkish and Norwegian cannon. Internally, it is very remarkable. Through the back part of the

pedestal, a door leads to a stone staircase, consisting of 60 steps. The figure itself is hollow, and resembles a mine, with side-passages which lead into the lion. A staircase of cast iron, of 58 steps, leads through the neck up into the head, where there are two sofas, and several openings for the enjoyment of the view. At the highest part of the head, there is the following inscription: "This colossal figure, erected by Louis I., king of Bavaria, was designed and modeled by L. von Schwanthaler, and cast in bronze, in years 1844 to 1850, by Ferdinand Miller." The head contains standing-room for 31 persons. The whole figure consists of seven pieces, and the lion, of five. The monument was formally uncovered, amidst great rejoicings, on the 7th Aug., 1850.

BA'VINS, in the pyrotechny of warfare, are small bundles of easily ignited brush wood, from 2 to 3 ft. in length. They are made by arranging the bush-ends of the twigs all in one direction, tying the other ends with small cord, dipping the bush-ends into a kettle containing an inflammable composition, and drying them. They are employed among the combustible materials in fire-ships.

BAWBEE, or BABEE, the popular designation of a half-penny in Scotland, now dropping out of use. The origin of the term is obscure; but it is most probably a corruption of *bas billon*, Fr., applicable to debased copper money. In the plural form, the word is often popularly used in Scotland to signify money generally. In Scottish song, B. is synonymous with a girl's fortune or marriage-portion—as, *Jenny's Bawbee*.

BAWR, ALEXANDRINE SOPHIE COURY DE CHAMPGRAND, Baroness de; 1773–1861; a French novelist and dramatist, wife of Saint Simon, who got a divorce because he did not think her fit to be the wife of "the first man in the world." In 1806, she wedded baron de Bawr, who was killed by accident a few months after the marriage. Some of her plays are still occasionally acted.

BAXTER, a co. in n. Arkansas, on the Missouri border, bounded on the n. by White river; about 600 sq.m.; pop. '80, 6,004. The surface is hilly and undulating, and the soil fertile. Farming and stock-raising are the main occupations. Co. seat, Mountain Home.

BAXTER, ANDREW, 1686–1750; a Scotch philosopher, author of *An Inquiry into the Nature of the Human Soul, wherein its Immateriality is evinced from the Principles of Reason and Philosophy*. He also wrote on questions of science for the teaching of children.

BAXTER, RICHARD, one of the most eminent of the nonconformist divines, was b. Nov. 12, 1615, of poor but genteel parents, at Rowton, in Shropshire. His early education was somewhat neglected. Instead of attending, as he wished, one of the universities, he was obliged to content himself with a course of private study, in the midst of which he was induced, singularly enough, for he was habitually serious, to try his fortune at court. Hither he accordingly hied, fortified with an introduction to the master of the revels. A month sufficed to convince him that he was out of his element at Whitehall, and a protracted illness after his return helped to deepen the earnestness of his religious convictions. Soon after, at the age of 23, he was ordained, and entered on the mastership of Dudley grammar-school, from which he removed to act as assistant to a clergyman at Bridgenorth, where he resided nearly two years. In 1640, he was invited to become parish clergyman of Kidderminster, an offer which he accepted; and within a comparatively brief period, not only did he establish his reputation as one of the most remarkable preachers of the time, but what was better, succeeded in effecting a wonderful improvement in the manners of the people. On the breaking out of the civil war, his position became somewhat peculiar. Sincerely attached to monarchy, his religious sympathies were almost wholly with the Puritans; and though a Presbyterian in principle, he was far from admitting the unlawfulness of episcopacy. These views, which, some time before the restoration, became extremely popular, were now too catholic for the general taste, and the open respect shown by B. to some leading Puritans exposed him to some danger from the mob. He accordingly retired to Coventry, where he ministered for two years to the garrison and inhabitants. He afterwards accepted the office of chaplain to col. Whalley's regiment, and was even present at the sieges of Bridgewater, Exeter, Bristol, and Worcester. His influence was at all times exerted to modify the intolerance of partisanship, and to promote "the spirit of love and of a sound mind." On the urgent invitation of his parishioners, he returned to Kidderminster, when ill-health forced him to leave the army, and continued to labor there for some time. During this period, he greatly extended his fame by the publication of his *Saints' Rest* and *Call to the Unconverted*. He never dissembled his sentiments with regard to the execution of the king and the usurpation of Cromwell, even in the presence of the protector himself, who endeavored, without success, to enlarge his ideas on the subject of revolutions. On the return of Charles, B. was appointed one of his chaplains, and took a leading part in the conference held at the Savoy to attempt a reconciliation between the contending church factions, a project defeated by the bigoted obstinacy of the bishops. B. was tempted with the offer of the see of Hereford, but declined the honor, praying instead to be permitted to return to his beloved flock at Kidderminster. He asked no salary, but his request was refused. The act of uniformity at length drove him out of the English church, and in July, 1663, he retired to Acton, in Middlesex, where he spent the greater part of nine years, chiefly occupied in the composition of

some of the most important of his numerous works. These he produced with a rapidity unparalleled in modern generations, at least in this one respect, that the quality was not always in the inverse ratio of the quantity. The act of indulgence in 1672 permitted him to return to London, where he divided his time between preaching and writing. At length, in 1685, he fell into the brutal clutches of judge Jefferies, who condemned him, for alleged "sedition" in his *Paraphrase of the New Testament*, to pay a fine of 500 marks, and in default, to lie in the king's bench prison till it was paid. The circumstances of the trial are graphically described by Macaulay in the second volume of his history. After a confinement of nearly 18 months, B. was released and pardoned, on the mediation of lord Powis. He lived after this to see better times, and died on the 8th Dec., 1691, in the 75th year of his age.

B. is said to have preached more sermons, engaged in more controversies, and written more books than any other nonconformist of his age; and Dr. Isaac Barrow has said of him, that "his practical writings were never mended, and his controversial seldom confuted." The total number of his publications exceeded 160. Of these, by far the most popular and celebrated are his *Saints' Rest*, *Dying Thoughts*, and *Call to the Unconverted*—20,000 copies of which last were sold in a twelvemonth, and it was translated into all European languages. More important, however, in a theological point of view, are his *Methodus Theologiæ* and *Catholic Theology*, in which his peculiar system—a compromise between Arminius and Calvin—is embodied. His autobiographical narrative is historically valuable; the review of his religious opinions is spoken of by Coleridge as one of the most remarkable pieces of writing in religious literature. A complete edition of his works, in 25 vols., with a life by Orme, was published in 1830. His practical works, in 4 vols., were published in 1847.

BAXTERIANS is the term that was formerly applied to those who adhered to Baxter's theological system, the peculiar doctrines of which were: 1st, That though Christ died in a special sense for the elect, yet he also died in a general sense for all; 2d, The rejection of the dogma of rebrobation; 3d, That it is possible even for saints to fall away from saving grace. The tendency of Baxter's views was towards a more liberal theology, but they are deficient in logical consistency. Nevertheless, they have been, and still are, embraced by many pious people—especially among the dissenters—who shrink from accepting what they consider the hard conclusions of Calvinism, or the latitudinarian views of Arminianism. The two most eminent B. are Dr. Isaac Watts and Dr. Philip Doddridge.

BAY (from a Saxon root, "to bend") is properly applied to an indentation of the sea into the land, with an opening wider than the depth. A gulf is understood to be deeper than a bay, and has often a narrow opening. These terms are often loosely applied; Baffin's bay, e.g., is really a gulf. When the body of water is large, and the entrance narrow, it becomes a shut sea, as the Baltic, the Red sea, etc. Hudson's bay, the Persian gulf, and the gulf of Mexico might with propriety be termed seas.

BAY, a name given to a number of trees and shrubs more or less resembling the laurel or victor's laurel (*laurus nobilis*), which is also called SWEET BAY (see LAUREL); the name *baye*, which was once exclusively applied to the fruit, having been extended to the whole plant. The common laurel or cherry laurel (*prunus laurocerasus*) is sometimes called BAY LAUREL. See LAUREL.—The RED BAY of the Southern states of America is *laurus caroliniensis*. See LAUREL.—The WHITE BAY of America is *magnolia glauca* (see MAGNOLIA), and the LOBLOLLY BAY of the same country is *gordonia lasianthus*. See GORDONIA.

From early times, bay-leaves have been associated with popular superstitions and usages. Along with other evergreens, they have adorned houses and churches at Christmas; and in token of rejoicing or of some meritorious deed, sprigs of bay, as well as of laurel, have been worn in the hat, or wreathed around the head. There appears to have been a notion that the B. was an antidote against the effects of thunder. In an old play, *The White Devil*, Cornelia says:

> "Reach the bays:
> I'll tie a garland here about his head,
> 'Twill keep my boy from lightning."

According to Shakespeare, the withering of bay-trees was reckoned an omen of death. Thus Richard says:

> "'Tis thought the king is dead; we'll not stay.
> The bay-trees in our country are withered."

The following passage occurs in *Parkinson's Garden of Flowers*, 1629, p. 598: "The bay-leaves are necessary both for evil uses and for physic, both for the sick and for the sound, both for the living and the dead. It serveth to adorn the house of God, as well as man; to crowne or enriche, as with a garland, the heads of the living; and to strike and decke forth the bodies of the dead; so that from the cradle to the grave, we have still use of it, we have still need of it." For other notices of this kind respecting the B., we refer to *Brand's Popular Antiquities*, also to *Hone's Year Book*. Bay-leaves are sometimes used in cookery for the sake of flavoring.

BAY, a co. in n.e. Michigan on Saginaw bay; intersected by Saginaw river and a branch of the Michigan Central railroad; 750 sq.m.; pop. '74, 24,832. There is little of agriculture, lumber being the main article of trade. Co. seat, Bay City.

BA'YA, *Ploceus Philippinus*, a small East Indian bird, of the great family of the *fringillidæ* (q.v.), and of a genus to some of which, from their remarkable manner of constructing their nests, the name weaver bird (q.v.) is often given. It is described by the older ornithologists under the name of the Philippine grossbeak, or *loxia Philippina*. It is yellow, spotted with brown, the throat black, the beak conical and large. Its nest is very curious. Suspended from a slender twig of a lofty branch, so that monkeys, squirrels, and serpents may not reach it, it is rendered still more secure by its form, which is very like that of a common Florence flask, the entrance, however, being from beneath, and not from above, with lateral openings to separate chambers, in one of which the female sits upon the eggs, whilst another is occupied by the male, who there pours forth his song. It is composed of fine fibers of leaves and grass. The B. is very easily tamed, will perch on the hand, and can be trained to fetch and carry at command.

BAYADE'RES (from the Portuguese *bailadeira*, that is, dancing-girl) is the name given by Europeans to the dancing-girls and singers in India, who are divided into two great classes, each comprising many subdivisions. The first of these classes, who are called Devadasi—that is, slaves to the gods—are divided into two distinct grades, according to the rank of the families whence they have sprung, the dignity of the idol to which they are devoted, and the authority and riches of the temple to which they belong. Those of the first rank are chosen from the most influential families of the Vaisya caste, to which the rich landed proprietors and merchants belong. Those of the second class are chosen from the chief Sudra families, who correspond to our mechanics. No girls can be admitted among the Devadasis but such as are still in childhood, and free from any bodily defect. The parents of the girl must renounce by a solemn agreement all right to their child, who then receives the necessary instruction. The employment of the Devadasis is to sing the praises of their god at festivals and solemn processions, to celebrate his victories and great deeds, and to dance before him, to weave the wreaths with which the images are adorned, and in general to perform subordinate offices in the temple and for the priests. On the other hand, they are excluded from the celebration of such rites and ceremonies as are accounted peculiarly sacred, as, for example, at sacrifices for the dead, suttis, etc. The Devadasis of the first rank live within the inclosure of the temple, which they are not permitted to leave without the special permission of the high priest. They must remain unmarried for life, but are, notwithstanding, permitted to choose a lover, either in or out of the temple, provided he belongs to one of the high castes. A connection with a man of low rank would be punished with the utmost severity. If they have children, the girls are brought up to their mother's profession, and the boys are educated for musicians. The Devadasis of the second rank differ but little from those of the first, but they have more freedom, as they live without the temple. A certain number of them must attend daily at the temple service, but at public processions they are all obliged to appear. They not only dance and sing before the images—for which they receive a fixed allowance of rice-money—but when summoned by the nobles, they perform at marriages, banquets, etc. All the Devadasis reverence, as their special patroness and protectress, the goddess Rambha, one of the most beautiful dancers in the paradise of Indra. They bring a yearly offering in spring to her and to the god of love. The singing-girls who travel about the country are of an essentially different class from the Devadasis. They perform only at private feasts, entertain strangers in the *tschultris*, or public inns, and get different names according to the special arts in which they excel. Some of them live independently in bands, consisting of from 10 to 12 persons. They travel about the country, and divide their gains with the musicians who accompany them. Others are under the authority of *dayas*, or old dancing-women, who receive all the money they gain, and give the girls only enough for food and clothing. Some are really the slaves of such old women, who have procured them in their infancy either by purchase or by capture, and have instructed them in their art. To one of these classes belonged those B. who visited several of the European capitals in 1839. The costume of the B. is not without a certain alluring charm. Their dances do not resemble what we are accustomed to call dancing, but are rather a species of pantomime, which is explained by the songs recited by the accompanying musicians. The themes of these songs are usually either happy or despairing love, jealousy, etc. Europeans have spoken with much enthusiasm of the charms of these pantomimes; but to judge by the performances of the above-mentioned B. during their visit to Europe, these descriptions must be looked upon as very much exaggerated; for although these dancers possessed great physical agility, their movements were wanting in dignity and grace.

BAYA'MO, or SAN SALVADOR, a t. in the eastern part of the island of Cuba, 60 m. n.w. from Santiago. It is situated in an unhealthy plain, near the left bank of the Canto, a small river which falls into an arm of the sea called the canal of Bayamo. The town carries on a considerable trade. Pop. about 7500.

BAYARD, JAMES ASHETON, 1767–1815; b. Philadelphia; a descendant of Nicholas B., a French Huguenot; educated at Princeton; began law practice in Delaware; was

elected to congress; declined the mission to France; was chosen U. S. senator in 1804; was one of the commissioners of the United States at Ghent to negotiate for peace with Great Britain in 1814; afterwards offered the mission to Russia, but refused it.

BAYARD, JAMES ASHETON, son of the first James Asheton; U. S. senator from Delaware for two terms, resigning in 1869. He was an eminent lawyer, and for years chairman of the senate judiciary committee.

BAYARD, JEAN FRANÇOIS ALFRED, 1796–1853; a French dramatist, working with Dumanoir, Scribe, and others, and husband of Scribe's niece. He was the author of more than 200 plays.

BAYARD, PIERRE DU TERRAIL, Chevalier, the knight *sans peur et sans reproche*, b. 1476, at Castle Bayard, near Grenoble, was perhaps the only hero of the middle ages who deserved the unmingled praise and admiration bestowed upon him. Simple, modest, a sterling friend and tender lover, pious, humane, and magnanimous, he held together in rare symmetrical union the whole circle of the virtues. After acting as page to the duke of Savoy, Bayard entered the service of Charles VIII., whom he accompanied to Italy, and gained renown in the battle of Verona, where he took a standard from the enemy. At the beginning of the reign of Louis XII., Bayard was engaged in a battle near Milan, where he followed the defeated and retreating forces with such impetuosity that he entered the city with them, and was made a prisoner, but the duke Ludovico Sforza released him without ransom. At Barletta, in 1502, Bayard, with ten other French cavaliers, fought a tournament with an equal number of Spaniards, in order to decide their respective claims to superiority; and although seven Frenchmen were overthrown in the first charge, the result, chiefly through Bayard's bravery, after a six hours' combat, was declared equal. Next, we find him fighting bravely in Spain, and against the Genoese and Venetians. When pope Julius II. declared war against France, Bayard hastened to support the duke of Ferrara; but failed in his scheme for making the pope a prisoner. Subsequently, he won fresh laurels in Spain. In the war with Henry VIII. of England—who had threatened Picardy, and besieged Terouane, in 1513—when the French, on one occasion, were about to lay down their arms, Bayard made a sudden attack on an English officer, and, pointing his sword at his breast, said: "surrender, or I take your life." The Englishman gave his sword to Bayard, who returned his own, saying: "I am Bayard, your prisoner; and you are mine." The emperor and the king of England exchanged their prisoners without any demand of ransom for Bayard. When Francis I. had ascended the throne, Bayard was sent into Dauphiné to make a way for the army over the Alps and through Piedmont. In this expedition, he made Prosper Colonna a prisoner. Next, Bayard gained, at Marignano, a victory for the king, who, in consequence, submitted to receive the honor of knighthood from Bayard. When Charles V. broke into Champagne, at the head of a large army, Bayard defended Mezieres against all assaults, and on his entry into Paris, he was hailed as the saviour of his country, was made knight of the order of St. Michael, and appointed over a company of 100 men, led in his own name, an honor which until then had been confined to princes of the blood-royal. He was slain by an arrow from an arquebuss, while crossing the Sesia, April 30, 1524. So highly was he esteemed for all noble qualities, that his death was lamented not only by the French king and nation, but also by his enemies. His love of virtue, especially of that kingliest of virtues, *justice*, was so passionate, that he was wont to declare that all empires, kingdoms, and provinces where justice did not rule, were mere forests filled with brigands. His body was taken by the enemy, but was restored to France, and interred in the church of the Minorites' monastery, near Grenoble.

BAYARD, RICHARD BASSETT, 1796–1868, b. Del.; son of the first James Asheton. He was U. S. senator from Delaware from 1836–39, and from 1841–45.

BAYARD, THOMAS FRANCIS, b. Del., 1828; son of the second James Asheton; succeeded his father as U. S. senator in 1869.

BAYAZID', or BAYEZEED', a t. of Turkish Armenia, in the pashalic of Erzeroum, from which place it is distant e.s.e. about 150 miles. It is situated about 15 m. to the s.w. of the foot of Mt. Ararat; is fortified; and has a pop. of about 5000, mostly Kurds. Prior to 1830, its pop. was estimated at upwards of 15,000, and it had a brisk trade; but since that time, on account of Russian interference, its commerce and inhabitants have gradually decreased. B. has repeatedly been the scene of conflict. The Berlin congress of 1878 restored B. to Turkey, though it had been ceded to Russia by the preliminary treaty.

BAYAZID' I. See BAJAZET.

BAY'BERRY. See CANDLEBERRY.

BAY CITY, seat of justice of Bay co., Mich., on Saginaw river, near its junction with the bay of that name; on the Jackson, Lansing and Saginaw railroad, and the terminus of the Detroit and Bay city, and East Saginaw roads; pop. '74, 13,690; in '80, 38,088. It is growing rapidly and has an important trade in timber, salt, and fish.

BAYER, JOHANN, a German constructor of charts of the stars, was born either at Augsburg or at Rhain, in Bavaria, in the latter part of the 16th c., and fulfilled the

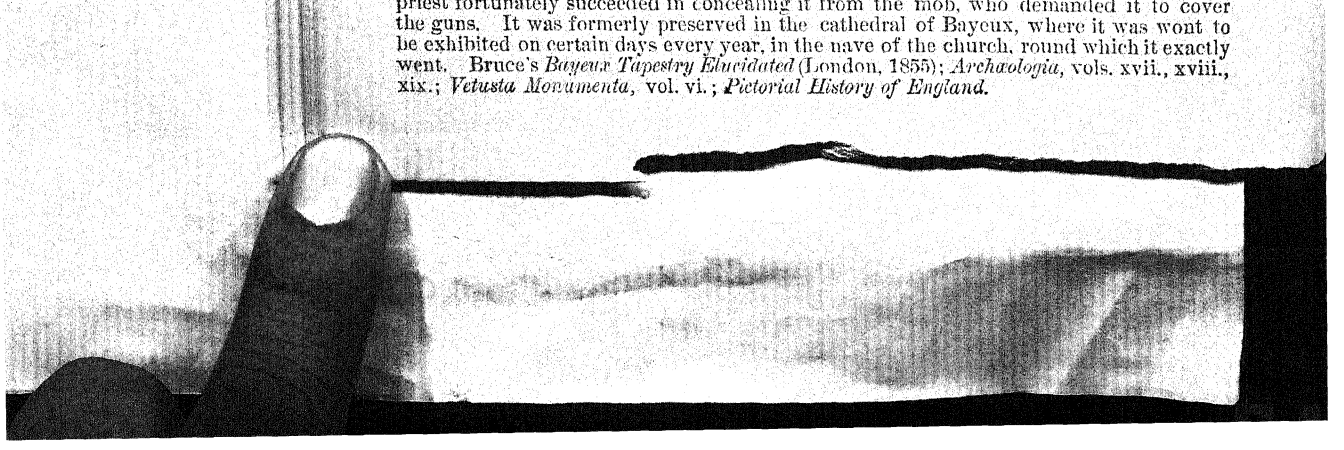
duties of a Protestant pastor in several places. His zeal for the Protestant church was so conspicuous, that he obtained the cognomen *Os Protestantium* (the Mouth of Protestants); other accounts state that he was an advocate at Augsburg. It matters little which, as he is now remembered only on account of his *Uranometria* (1603, and 2d ed. 1639), in which he gave 51 maps of the heavens, constructed from the observations of his predecessors, and followed by explanations in his *Explicatio Caracterum Æneis Tabulis Insculptorum* (Stras. 1624). Although his maps are not remarkable for accuracy, even for his time, he has the merit of introducing the simple plan of distinguishing the stars of a constellation by means of letters. The largest star of the constellation he named by the first letter of the Greek alphabet (α), and the rest in the order of their apparent brilliancy, by the following letters. This convenient plan is still followed.

BAYEUX, a city of Normandy, in France, dep. Calvados, situated on the Aure, not far from its mouth. Pop. '76, 8315. B. is chiefly built of wood and plaster, is famous for its porcelain, and has also manufactories of lace, linen, calicoes, leather, and hats. It is a town of great antiquity—its cathedral being said to be the oldest in Normandy. In it was preserved for centuries the famous Bayeux tapestry (q.v.), now in the public library of the place. B. is the seat of a bishop, and has a college.

BAYEUX TAPESTRY, a web of canvas or linen cloth, 214 ft. long by 20 in. wide, preserved in the public library, Bayeux, upon which is embroidered, in woolen thread of various colors, a representation of the invasion and conquest of England by the Normans. Tradition asserts it to be the work of Matilda, wife of William the Conqueror, and it is believed that if she did not actually stitch the whole of it with her own hand, she at least took part in it, and directed the execution of it by her maids; and afterwards presented it to the cathedral of Bayeux, as a token of her appreciation of the effective assistance which its bishop, Odo, rendered to her husband at the battle of Hastings. Some antiquaries contend that it was the work not of queen Matilda (the wife of the conqueror), who died in 1083, but of the empress Matilda (the daughter of king Henry I.), who died in 1167. According to Mr. Bruce, the latest authority on the subject, the tapestry contains, besides the figures of 505 quadrupeds, birds, sphinxes, etc., "the figures of 623 men, 202 horses, 55 dogs, 37 buildings, 41 ships and boats, and 49 trees—in all, 1512 figures." The tapestry is divided into 72 distinct compartments, each representing one particular historical occurrence, and bearing an explanatory Latin inscription. A tree is usually chosen to divide the principal events from each other. This pictorial history—for so it may be called, and indeed, in several particulars, it is more minute than any written history we have—opens with Harold prior to his departure for Normandy, taking leave of Edward the confessor. Harold is next observed, accompanied by his attendants, riding to Bosham with his hawk and hounds; and he is afterwards seen, successively, embarking from the Sussex coast; anchoring in France, and being made prisoner by Guy, earl of Ponthieu; redeemed by William, duke of Normandy, and meeting with him at his court; assisting him against Conan, earl of Bretagne; swearing on the sacred relics never to interfere with William's succession to the Saxon throne, etc.; and finally re-embarking for England. The tapestry then represents Harold narrating the events of his journey to Edward the confessor, whose death and funeral obsequies we next see. Harold then receives the crown from the Saxon people, and ascends the throne; and next we have the news brought to William, who takes counsel with his half-brother, Odo, bishop of Bayeux, as to the invasion of England. Then follow representations of the active war-preparations of the Normans; their embarkation; disembarkation; march to Hastings, and formation of a camp there; the battle and death of Harold, with which the tapestry finishes.

The B. T. gives an exact and minute portraiture of the manners and customs of the times; and it has been remarked that the arms and habits of the Normans are identical with those of the Danes, as they appear in the miniature paintings of a manuscript of the time of king Cnut, preserved in the British museum.

M. Lancelot appears to have been the first to direct attention to the existence of this curious monument, by a description of an illuminated drawing of a portion of it he had discovered, in a paper presented to the academy of inscriptions and belles-lettres, in 1724. This led to the discovery of the tapestry itself, in the Bayeux cathedral, by père Montfaucon, who published an engraving of it in 1730, with a commentary on the Latin inscriptions. In 1767, Dr. Ducarel gave an account of it in his *Anglo-Norman Antiquities.* From that time until 1803, when Napoleon had it conveyed to Paris, the B. T. excited little attention. Its exhibition, however, in the national museum there awakened public curiosity concerning it, and gave rise to various speculations as to its age, intention, etc. The discussion satisfactorily established it to be what tradition asserted it—a contemporary pictorial record of the events of the Norman conquest. The society of antiquaries (London) published an engraving of the whole in the 6th volume of the *Vetusta Monumenta.* The B. T. would have been destroyed at the revolution, had not a priest fortunately succeeded in concealing it from the mob, who demanded it to cover the guns. It was formerly preserved in the cathedral of Bayeux, where it was wont to be exhibited on certain days every year, in the nave of the church, round which it exactly went. Bruce's *Bayeux Tapestry Elucidated* (London, 1855); *Archæologia,* vols. xvii., xviii., xix.; *Vetusta Monumenta,* vol. vi.; *Pictorial History of England.*



BAYFIELD (formerly La Pointe), a co. in n.e. Wisconsin, on lake Superior, including several islands; 1450 sq.m.; pop. '74, 1032; in '80, 680, or, with Indians counted, about 1100. The surface is uneven, and in great part covered with forests. Co. seat, Bayfield.

BAY ISLANDS, a small group in the bay of Honduras, about 150 m. to the s.e. of Balize, embracing only 25′ of lat., and 1° 15′ of long. The cluster was proclaimed a British colony in 1852. The chief island is Ruatan (q.v.); and the others of any consequence are Bonacca, Utila, Burburet, Helena, and Morat.

BAYLE, Pierre, one of the most independent thinkers in the 17th c., was b. in 1647 at Carlat, in the old co. of Foix, France, and studied philosophy under the Jesuits at Toulouse. The arguments of his tutors, but especially his friendly intercourse and quiet disputation with a Catholic clergyman, who lived in his neighborhood, led him to doubt the orthodoxy of Protestantism, and shortly prevailed so far that he openly renounced his father's creed, and adopted the Catholic one. In the course of about 17 months, however, the conversation of his relatives brought him back to the Protestant profession. To escape ecclesiastical censure, he now went to Geneva, and thence to Coppet, where he studied the philosophy of Descartes. After a few years, he returned to France, and in 1675 was elected to fill the chair of philosophy in the university of Sedan. In this office he remained until 1681, when the university was disfranchised. His next appointment was that of professor of philosophy at Rotterdam. The appearance of a comet in 1680 having given occasion to a widely spread alarm, B., in 1682, published his *Pensées Diverses sur la Comète*, a work full of learning, and treating, in discursive style, many topics of metaphysics, ethics, theology, history, and politics. This was followed by his *Critique Générale de "l'Histoire du Calvinisme de Maimbourg."* In 1684, he commenced a periodical, *Nouvelles de la République des Lettres*. The religious persecutions in France gave B. occasion to write his *Commentaire Philosophique sur ces Paroles de l'Evangile: "Contrains les d'entrer,"* which professed itself to be a translation from the English, and contained a strong defense of the principle of toleration. In consequence of the accusations brought forward by the theologian, Jurieu, who regarded B. as an agent of France, and the enemy of Protestants, B., though he skillfully defended himself, was deprived of his license to teach (in 1693). He now assiduously devoted his leisure to the *Dictionnaire Historique et Critique* (1st edition, 2 vols., Rotterd. 1696—last edition, 16 vols., Paris, 1820). This was the first work published under his own name. Again Jurieu came forward as B.'s adversary, and induced the consistory of Rotterdam to censure the dictionary, chiefly on account of the supposed irreligious tendency of the article on "David," and the commendation bestowed on the moral character of certain atheists. B. promised to expunge all the objectionable matter; but afterwards, when he found that the public entertained a different and more favorable opinion of the peculiar passages than the Rotterdam consistory, he judged it best to allow them to remain as they were, or made only slight alterations. New opponents were called into the arena by his *Réponse aux Questions d'un Provincial*, and the continuation of his *Pensées sur la Comète*. Jacquelot and Leclerc now attacked his religious opinions, while others persecuted him as the enemy of Protestantism and of his adopted country, Holland. These literary and theological controversies had a bad effect on his failing health, and a disease, for which he refused to employ medical aid, proved fatal. He died Dec. 28, 1706.

B. stands at the head of modern sceptics and logicians. Accustomed to view every question scrupulously on all sides, he was apparently led to doubt on religious matters generally; at least, it is not to be denied that his scepticism carried him the length of doubting the worth or the wisdom of the religious dogmatism that ruled both Catholics and Protestants in his day. B. was thus the antithesis of a bigot, but his hostility to bigotry rather originated in his indifference to the doctrines about which theologians quarreled, than in any clear or high perception of the iniquity of religious persecution. With great eloquence and persistency, he vindicated the doctrine that moral characteristics and convictions may exist and flourish independently of particular religious opinions; and considering the barbarous manner in which the rival churches in B.'s time sought to enforce conformity of sentiment, and crush the liberty of private judgment, it is not to be wondered at that this doctrine, however objectionable abstractly, should have found a wide acceptance in Europe. Voltaire calls him "a more admirable logician than a profound philosopher;" and adds that "he knew almost nothing of physics." This probably means no more than that he was ignorant of the then recent discoveries of Newton; for the scientific articles in the dictionary presuppose a knowledge of the theories of Descartes (q.v.), with which he was conversant enough. The style of B. is clear and natural, but diffuse, and often impure. The articles in the dictionary seem to have been chosen merely as vehicles to introduce numerous digressions in notes, many of which are prolix and uninteresting; but the greater number of the articles are characterized by good sense, logic, critical acumen, and great learning. Though it is impossible to detect the presence of a religious or a philosophical system in the work, it everywhere gives indications of the high intelligence, honest principle, and universal knowledge of the author. It was proscribed both in France and Holland, and was consequently very widely diffused in both countries, and has exercised an immense influence over the literature and philosophy of the continent. It was the dawn of scepticism in the 18th

c., and may be historically regarded as the protest of the enlightened human intellect against the irrational dogmatism of the churches. In his personal character, B. was amiable, obliging, disinterested, and modest, but at the same time morally courageous and independent. His *Œuvres Diverses* were published in four volumes at the Hague, 1725–31. See life of B. by Des Maizeaux (Amsterdam, 1712), and by Feuerbach (1838).

BAYLEN', a t. in the province of Jaen (Andalusia), Spain, situated 22 m. n.n.e. of Jaen. It has manufactures of linen, glass, bricks, tiles, soap, etc. Pop. 8000. B. is celebrated as the place where the Spaniards won their first and only victory over the French in July, 1808, and that more by accident, and the errors of the French commander, Dupont, than by good generalship on their part. About 18,000 French soldiers laid down their arms at B., the only condition being, that they should be sent to France; and other detachments of French troops afterwards offered their submission. The Spaniards, however, basely broke faith with them, and sent them to the hulks at Cadiz. The capitulation had the worst effect on the French arms. Joseph Bonaparte at once fled from Madrid, and Napoleon could find no words strong enough to express his indignation at the folly and pusillanimity of the surrender.

BAYLEY, James Roosevelt, d.d., 1814–77; b. N. Y.; a graduate of Washington (now Trinity) college, Hartford; ordained minister of the Protestant Episcopal church, and preached in New York and Maryland; went over to the Roman Catholic church, and was ordained by bishop Hughes in Mar., 1842; was professor of belles lettres at St. John's college, Fordham, N. Y., and president thereof. From 1846 to 1853 he was secretary to archbishop Hughes, and in the latter year was consecrated bishop of Newark, N. J. He founded Seton Hall college, and many schools and other institutions. In 1872, he was made archbishop of Baltimore. He published a history of the Roman Catholic church in New York, *Pastorals for the People*, etc. He was much esteemed for his social as well as his intellectual gifts.

BAYLEY, Richard, 1745–1841; b. Conn.; became a physician; studied in London hospitals; practiced in New York in 1772; went to Europe in 1775, and the next spring returned as staff-surgeon to sir Guy Carleton. He lectured on surgery, and published a work on croup; was professor of anatomy and surgery in Columbia college; first health officer of the port of New York; wrote on yellow-fever, which he did not believe was contagious, and finally died of ship-fever taken while on duty as health officer. His sister, Mrs. Seton, who with his son (afterwards bishop B.) became Roman Catholic, founded the order of sisters of charity in this country.

BAYLOR, a co. in n.w. Texas; 900 sq.m.; thus far unsettled. It has a mountainous surface, with rich bottom lands.

BAYLY, Lewis, d. 1632; b. in Wales; educated at Oxford; in 1616, made bishop of Bangor. He was the author of *The Practice of Piety*, the most popular religious book until Bunyan's work appeared. His son, Thomas, became a conspicuous Roman Catholic, and published, among other works, *The End of Controversy*.

BAYLY, Thomas Haynes, 1797–1839; an English poet. He was intended for holy orders, and educated at Oxford; inherited a large fortune, but lost it, and in 1831 began to write songs for music, and, with Henry Bishop, published *Melodies of Various Nations*. Within a few years he wrote 36 pieces for representation, a number of stories, and hundreds of songs. Some of the more popular were *The Soldier's Tear; Why Don't the Men Propose? We Met, 'twas in a Crowd; I'd be a Butterfly*, etc. His larger works were *Alymers, Kindness in Women, Weeds of Witchery*, etc. Two volumes were published after his death.

BAYNE, Peter, b. 1829; a Scotch author; educated in Marischal college, Aberdeen; studied theology at Edinburgh, and philosophy under sir William Hamilton. He wrote criticisms on Alison, De Quincey, Hugh Miller, and others. In 1855, he published *The Christian Life, Social and Individual; Essays in Biography and Criticism*. He was editor of the Glasgow *Commonwealth*, traveled and studied in Germany, and married the daughter of a Prussian general. His more recent works are a defense of Hugh Miller's *Testimony of the Rocks*, *Testimony of Christ and Christianity*, and *The Days of Jezebel*, a historical drama.

BAY OF ISLANDS, near the northern extremity of New Ulster, the more northerly of the New Zealand isles. Lat. 35° 14′ s., long. 174° 11′ east. On its coasts, which are pretty nearly the antipodes of the Straits of Gibraltar, are the British settlements of Russell and Kororarika.

BAYONET, supposed to be named from Bayonne, as the place of its invention, is a dagger or small spear fixed at the end of a musket or similar weapon. The first bayonets, used in France in 1671, called *bayonets-à-manche*, had handles which fitted into the muzzle of the guns; but at a later date were introduced the *bayonets-à-douille*, or socket-bayonets, having a socket which enabled the B. so to be used as not to interrupt the firing. The use of pikes went out when that of bayonets came in. It seems very probable that the first B. was a dagger, which the musketeer stuck by means of its handle into the muzzle of his weapon, to shield him from a cavalry charge; and that the usefulness of the contrivance suggested a permanent arrangement. Bayonets are

now made with great rapidity at the government rifle factory at Enfield. Two pieces of metal are first selected—viz., a piece of the very best cast steel, 7 in. long by $\frac{3}{4}$ in. square; and a piece of the best wrought-iron rod, 4 in. long by about 1 in. in thickness. The steel is to form the blade, and the iron the socket-handle. The steel being properly shaped at one end, is joined to the iron by welding. A forging-machine is next employed to give a rough outline of the required shape. Then comes the action of a swaging-machine, with dies which come down upon the metal in great force and counter-dies beneath the metal. The metal is then annealed; turned in a cutting-machine to remove a wire-edge thrown up in the act of stamping; cut to a proper length, and the socket-end made square; drilled and bored, to make the socket hollow; shaped and furrowed along the blade; bent at the neck; hardened and tempered; and finished by a numerous train of minor operations. The Bayonet charge is now one of the most terrible maneuvers of trained infantry, in which each nation fancies itself to excel all others.

BAYONNE, one of the most strongly fortified towns of France, in the department of the Basses-Pyrénées, situated at the confluence of the Adour and Nive, about 3 m. from the mouth of their united waters in the bay of Biscay. These rivers divide the town into three parts—Great and Little Bayonne, and the suburb of St. Esprit. Pop. in 1876, 22,307. B. is beautifully situated at the foot of the Pyrénées, and is itself a handsome place. It has extensive ship-yards, rope-walks, glass-manufactories, sugar-refineries, and distilleries, and a brisk export trade in hams, for which it is famous, chocolate, liqueurs, timber, tar, and cork. Its chief imports are wool, olive-oil, and liquorice. It is the see of a bishop, has a cathedral, a mint, and schools of commerce and navigation. B. is also historically interesting. It is said that here Catharine de' Medici and the duke of Alba planned the massacre of the Huguenots, which took place on St. Bartholomew's day, 1572. Here the great Napoleon cozened Charles IV. out of the crown of Spain, after he had ineffectually endeavored to get Ferdinand VIII., to whom Charles had previously resigned it, to give it up. The forcing of the passage of the Nive, immediately in this vicinity, by the British, in Dec. 1813, occasioned some of the most bloody conflicts of the Peninsular campaign. The place was invested by the British early in the following year, and a sally from it by the French, in April 14, was only repulsed after great loss on the side of the British. B. is also famous as the place where the bayonet was invented about the year 1670.

BAYOU, a stream not fed with springs, but running from one body of water to another, like a canal. Tidal channels in the states on the gulf of Mexico often have the name.

BAYOU SARA, a village in Louisiana, parish of W. Feliciana, 165 m. above New Orleans, on the Mississippi; an important point for shipping cotton.

BAYRHOFFER, KARL THEODOR, b. 1812; German philosopher and politician; professor of philosophy in the university of Marburg. He was prominent in the revolutionary movement of 1848, a member of the diet of Hesse-Cassel, and for a time president of the chamber. After the defeat of his party (the democratic) he migrated to America.

BAY-SALT is a name applied to common salt which is obtained from sea-water by solar evaporation. It is extensively obtained from *salt-marshes* which exist along the coasts of France and on the shores of the Mediterranean. See SALT.

BAY-WINDOW, or (corruptly) BOW-WINDOW, a window peculiar to Gothic architecture, so called because it forms a *bay* or projecting space outwards from a room. The external walls of bay-windows are, for the most part, either rectangular or polygonal, the semicircular form from which the term *bow* was probably derived having been unknown previously to the introduction of the debased Gothic. Though mentioned by Chaucer, bay-windows are not found in any of the styles before the perpendicular, during the prevalence of which they were frequently introduced, particularly in halls. Bay-windows generally reach to the floor, and are frequently supplied with a seat, which is called the *bay-stall*. There are many very beautiful examples of bay-windows in the colleges and halls of Oxford and Cambridge. When used in upper stories, such windows are supported on corbels, or large projecting moldings. See ORIEL.

BAZA (the *Basti* of the Romans), a t. of Spain, in the province of Granada, and about 50 m. e.n.e. of the city of that name. It lies in a rich plain, is generally ill built and irregular, with no feature of architectural interest. Pop. about 11,000, who are chiefly engaged in agricultural pursuits.

BAZAINE, FRANÇOIS ACHILLE, a marshal of France, b. 13th Feb., 1811. Entering the army in 1831, he served with distinction in Algeria, in Spain, in the Crimea, and in the Italian campaign of 1859. He took part in the French expedition to Mexico in 1862, and from 1863 till the end of the war held supreme command of the French forces. When in Africa in 1836 he had gained the cross of the legion of honor; in 1856, he had been promoted to be commander of the legion; in 1863, he received the grand cross; and in 1869, he was made commander-in-chief of the imperial guard. At the outbreak of the great war with Germany, Bazaine was at the head of the 3d army corps near Metz. After the battles of Wörth and Forbach he took command of the main French armies, and on

Aug. 14, 1870, began a retreat from Metz. Defeated at Mars-la-Tour and Gravelotte, he retired within the fortifications of Metz, which was immediately invested by prince Frederick Charles. Attempts to escape failing, Bazaine capitulated Oct. 27; when 3 marshals, over 6000 officers, and 173,000 men laid down their arms and became prisoners of war. In 1873, Bazaine was tried by a court-martial, and sentenced to degradation and death for having failed to do his duty. The sentence was commuted to 20 years' imprisonment. But in 1874, Bazaine contrived to escape from the fortress on the Ile Ste. Marguerite, on the s. coast, where he was then confined, and ultimately made his way to Madrid.

BAZALGETTE, Joseph William, b. 1819; an English civil engineer (of French descent) who executed the great drainage works of London, and planned others at home and abroad. He was also one of the engineers of the Thames embankment.

BAZANCOURT, César de, Baron, 1810–65; a French author; director of the library at Compiègne, and author of *History of Sicily under Norman Domination*. He was the official historian of the Crimean and Italian campaigns; wrote an account of the French expeditions to China and Cochin China, and a work on fencing.

BAZAR', or Bazaar', an oriental market-place, either open or covered, where various articles, including slaves, are exposed for sale, and where eastern merchants meet for transaction of business, as on 'Change or at the Bourse in England and France. In European cities, handsome establishments, especially for the sale of fancy goods, are now often styled bazars.

BAZARD, Amand, a French socialist, was b. at Paris, 19th Sept., 1791. After the restoration he helped to found the revolutionary society of the "Friends of Virtue;" and in 1820, an association of French carbonari (q.v.), which soon had 200,000 members. He was the leading conspirator in the "plot of Befort." After some time, Bazard, impressed with the necessity of a total reconstruction of society, attached himself to the school of St. Simon. In 1825, he became one of the editors of a St. Simonian journal, termed *Le Producteur*. In 1828, he delivered at Paris a series of prelections on his politico-religious creed, which met with extraordinary success. His socialistic views were afterwards published in the *chef-d'œuvre* of the sect, *Exposition of the Doctrine of St. Simon* (1828–30), of which only the first part was by Bazard, the second, containing the principles of the new social religion, being the composition of Enfantin. After the July revolution, a larger scope was afforded to the St. Simonians. The masses were attracted by the flattering doctrine, that "all social institutions ought to have for their end the moral, intellectual, and physical amelioration of the poor." In a short time, Bazard and his coadjutors had "created a new society, living in the midst of the old," with peculiar laws, manners, and doctrines. But Bazard's connection with it was of short duration. He differed from Enfantin on the doctrine of a "community of wives," and in Nov., 1831, seceded in disgust. His efforts to found a school of his own proved unsuccessful, and during a heated discussion with his former friend Enfantin, he was struck with apoplexy, from the effects of which he never recovered. He died at Courtry, near Montfermeil, on the 29th July, 1832.

BAZIN, Antoine Pierre Ernest, b. 1807; a French physician and professor of dermatology. His works relate chiefly to syphilis, and diseases of the skin.

BAZIN, Antoine Pierre Louis, brother of A. P. Ernest, a French professor of Chinese, translator from that language, and author of a Chinese grammar.

BAZOCHE, or Basoche, a kind of burlesque translation into French of the Latin word *basilica*, i.e., royal palace. When the French parliament ceased to be the grand council of the king, and confined itself exclusively to administering justice, a distinction of name necessarily sprang up between those noblemen who formed the royal train and the *habitués* of the court of justice. The former were called *courtiers;* the latter, *basochians*, or parliamentary clerks. But inasmuch as the word *basilica* necessarily presupposed a king, the *basochians*, to keep up their dignity, gathered round a mock one of their own making, who resided at the Château des Tournelles or the hôtel St. Pol, just as the courtiers did round the reality at the Louvre. Such was the origin of the basochian king and kingdom. Their historical existence can be traced to the beginning of the 14th c., when Philip the fair conferred on the brotherhood certain privileges. The principal authorities in this harmless monarchy, after the sovereign himself, were the chancellor, the masters of requests, the referendary, and the attorney-general. Henry III. suppressed the title of king, and conferred all the privileges and rights attached to that office on the chancellor. Still the B. continued to exist as a kingdom, minus its head, and affected on all occasions the language of royalty. Its jurisdiction included the consideration and decision of all processes and debates that arose among the clerks. It administered justice twice a week, and also caused a species of coin to be struck which had currency among its members; but if we are to judge from the proverb about *la monnaie de basoche*, it did not enjoy an immense credit in the outer world of hard cash. The mock-monarch also possessed the extensive privilege of selecting at his pleasure, yearly, from the French royal forests, a tall tree, which his subjects, the clerks, were in the habit of planting, on the 1st of May, before the grand court of the palace, to the sound of tam-

bourines and trumpets. But this was not all. In the public sports, this fantastical little kingdom was worthily honored; its chancellor had rooms at the hôtel de Bourgogne; at the carnival, the *basochians* joined themselves to the corps of the prince of fools, and to the performers of low farces and "mysteries." They acted in their turn a species of satirical "morality" (q.v.), in which they made extensive use of the liberty granted to them, in ridiculing vices and the favorites of fortune. Of course, they could not fail to provoke enmity and occasion serious scandal. Louis XII. patronized these amusements. In 1500, he gave the brotherhood of the B. permission to perform plays in the grand saloon of the royal palace. Francis I. witnessed them in 1538; but in 1540, they were interdicted as incorrigible. This interdict only applied to those of Paris, for several years after, we read of the basochian farces of Bordeaux. In their later development, they seem to have resembled the *fastnachtspiele* (Shrove-Tuesday plays), so popular in Germany both before and after the reformation. They were the beginning of French comedy.

BDELLIUM, a gum-resin, resembling myrrh (q.v.) in appearance and qualities, but weaker, and at the same time more acrid. High medicinal virtues were ascribed to it by the ancients, but it is now little used. It is supposed to be the produce of *balsamodendron Roxburghii* in India, and of *B. Africanum* (also called *hendelotia Africana*) in Senegal—trees or shrubs belonging to the natural order *amyridaceæ* (q.v.), so remarkable for the number of similar substances which it produces.—EGYPTIAN B., however, is obtained from the doom (q.v.) palm, *hyphæne Thebaica*. A similar substance is yielded also by *ezradia furcata*, a half-succulent plant of the natural order *compositæ*, inhabiting the most sterile regions of the s.w. of Africa; whilst the SICILIAN B., formerly used in medicine, is prodeced by *daucus gummifer*, a species of the same genus to which the carrot belongs, growing on the coasts of the Mediterranean.—The B. mentioned in Gen. ii. 12 is probably not a gum-resin at all; but what it is, is uncertain.

BEACH, MOSES YALE, 1800–68; b. Conn.; in early life a cabinet maker; inventor of a rag-cutting machine for paper mills, and of an engine for propelling balloons. After trying paper manufacturing, in 1835 he acquired an interest in the *Sun*, a penny daily paper begun in New York about three years earlier. He soon became sole proprietor, and was for years one of the pioneers of the penny press. Leaving the paper to his sons, he retired in 1857 with an ample fortune.

BEACHES, RAISED. Modern geology teaches that the frame of the land is liable to risings and depressions, even in the present age. Several districts in different parts of the world have been raised, in consequence of earthquakes, within the remembrance of the present generation. There is good proof that certain parts of eastern Sweden, bordering on the gulf of Bothnia, have been elevated about 3 ft. within the last hundred years. These facts prepare us to learn that, around the British islands, and in other parts of the earth, there are tracts of ground at various elevations above the present sea-level, which have evidently been sea-beaches at a former time. The evidences consist of—first, the levelness of the ground in the general direction of the present shores over considerable spaces; second, the alternating beds of sand and gravel, such as we see composing the present B.; and, third, the presence of marine shells, which, in our country, are generally of species now living in the boreal seas. There are also what may be called terraces of erosion—indentations made in a rocky coast by the lip of the sea in ancient times—usually consisting of a flat platform presenting patches of gravel, and of a backing wall or sea-cliff, the latter sometimes penetrated with deep caves. In Scotland, there is a very decided terrace of erosion all round the bold coasts of the w. Highlands and Western islands, at an elevation of about 25 ft. above the level of the similar, but scarcely so well-marked indentation which the sea is now making. In Lapland, there is a similar terrace, but stooping from 220 to 85 ft. in the course of 30 miles. There is also a clear and well-marked terrace of the same kind, at about 520 ft. above the present sea-level, behind Trondhjem in Norway. The whole subject is treated elaborately in *Ancient Sea-margins*, by R. Chambers, 1848, where a series of gravelly terraces are described as existing in Scotland at various heights above the sea, telling of an uprise of the frame of the land in stages, and indicating by their uniformity of level that this movement was equable.

BEACH PLUM, *Prunus maritima*, a sea-beach shrub of the Atlantic coast of the United States, bearing fruit much like the common garden plum. It abounds on the low sandy shore at the eastern end of Long island toward Montauk, and occurs from Massachusetts to Virginia.

BEACHY HEAD, the loftiest headland on the s. coast of England, projecting into the English channel, 2½ m. s.s.w. of Eastbourne, Sussex. It consists of perpendicular chalk-cliffs, 564 ft. high, forming the e. end of the South Downs. Several caverns have been cut out in the rock, for shipwrecked seamen to take refuge in; but shipwrecks have been far fewer since 1828, when the Bell Tont lighthouse was built here. This lighthouse is 285 ft. above the sea, in lat. 50° 44′ 24″ n., long. 0° 12′ 42″ e., and is seen above 20 m. off. The view from B. H., in clear weather, extends to Hastings, the Isle of Wight, and France. The cliffs are the resort of myriads of sea-fowl. Off this point, the French fleet beat the combined English and Dutch fleets in 1690.

BEACON (allied to *beck* or *beckon*, to give a signal), denotes any signal set upon a height, but especially the alarm-fires at one time used to spread the intelligence of foreign invasion or other great event. These fire-signals were in use in the earliest times, and notices of them are found in the literary remains of ancient Persia, Palestine, and Greece. They were made by kindling a pile or bale of wood on the tops of lofty mountains, and keeping the flame bright by night, or having the fire so covered as to emit a dense smoke by day. There were various preconcerted modes of exhibiting the light or smoke, so as to indicate the nature of the intelligence. Thus, an act of the parliament of Scotland, in 1455, directs that one bale on fire shall be warning of the approach of the English in any manner; two bales blazing beside each other, that they are *coming indeed;* and four bales, that they are coming in great force.

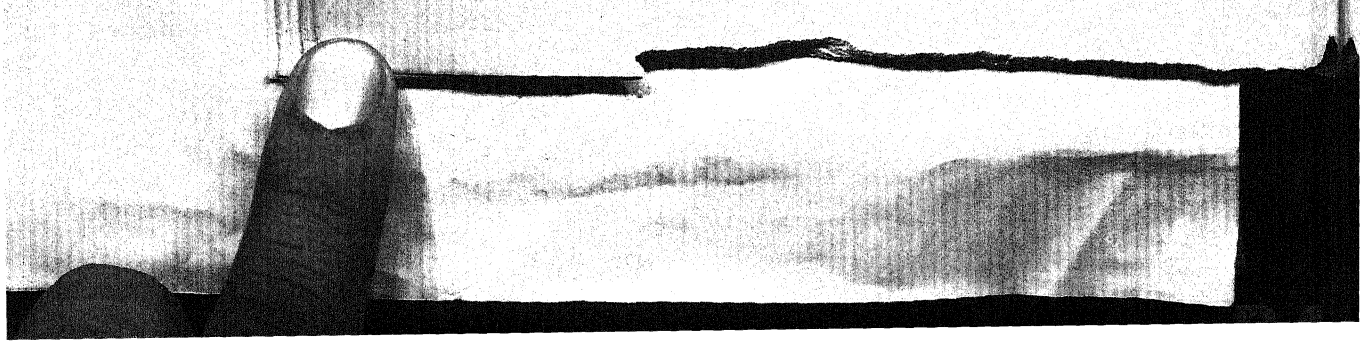
An early instance of B. signals is found in the book of the prophet Jeremiah, in his call, in chap. vi. 1, to the people of Benjamin to kindle a fire signal on one of their mountains: "Set up a sign of fire in Beth-haccerem; for evil appeareth out of the north, and great destruction." An instance of the use of a line of beacons in very ancient times is given in a passage of the tragedy of *Agamemnon*, by the Greek poet Æschylus. The commander-in-chief of the Greek army at the siege of Troy is represented as communicating the intelligence of the fall of the city to his queen, Clytemnestra, at Mycenæ, in the Peloponnesus. The line consists of eight mountains, and the news is supposed to be conveyed in one night from Troy.

In England, the beacons were kept up by a rate levied on the counties, and had watches regularly stationed at them, and horsemen to spread the intelligence during the day, when the beacons could not be seen. They were carefully organized while the Spanish Armada was expected. In the beginning of 1856, an old B. work on Malvern hill, in Worcestershire, which had done its part in the former days in spreading the intelligence of the appearance of the Armada, of the approach of the Young Chevalier, and of that of the Dutch fleet afterwards, dealt with by admiral Blake, was lighted up in anticipation of the close of the Crimean war, and afforded an interesting amusement to scientific persons in estimating the distance at which the blaze could be seen from distant mountains.

BEACON, in maritime affairs, is a signal for warning against dangers, or for indicating the proper entrance into a channel, harbor, or river. Generally speaking, a B. is fixed; whereas a *buoy* floats. The power of constructing these beacons rested at one time in the sovereign; but in 1565 an act of parliament empowered the Trinity house corporation to erect them on such parts of the sea-coast and forelands as appeared to be most in want of those safeguards; and tolls were levied on the maritime counties for their maintenance. In recent times, the construction of *floating* beacons has occupied a good deal of attention, as it is conceived that they might in many cases supply the place of much more costly light-houses. Messrs. Brown and Lenox have constructed for the Trinity board a B. for the Goodwin Sands—comprising a hollow wrought-iron floating vessel, with 6 water-tight compartments; a tower 28 ft. high, tapering in diameter from 7 to 3½ ft.; and a ball at the top of 3½ ft. diameter. This B was visible from a considerable distance; but some leakage frustrated its continued use. Mr. Herbert, in 1854, introduced a new B., intended to float upright in all states of the winds, tides, and currents; and others of similar character have since been invented. Many beacons are now made in which a bell is sounded instead of a light shown, as a warning. One by Messrs. Brown and Lenox is so constructed as to yield a continuous bell-ringing, so long as tide or current is flowing. There is a keel at the bottom, to make the B. turn with the tide. There are channels below the line of flotation, through which the tide-water or current flows; the water causes two undershot wheels to revolve; and this revolution, by means of axes, cranks, rods, guides, and levers, is made to bring the force of a hammer to bear on a bell. Some beacons on this principle have a bell of 2 cwt. Nearly allied with beacons, although not strictly such, are *gong*-beacons, of which about 40 have been supplied to light-vessels on the English and Welsh coasts. Fog sirens, fog whistles, and fog horns, are similarly employed; and a parliamentary paper, published in 1873, gives interesting details on this subject; but these audible signals are connected with light-houses or light-ships, and are only beacons in an indirect sense. See BUOY and LIGHT-HOUSE.

BEAD, BEADE, or BEDE (allied to "bid"), in Anglo-Saxon and Old English, signified "a prayer," and hence came to mean the small perforated balls of gold, silver, glass, ivory, hard wood, etc., used for keeping account of the number of prayers repeated. A certain number strung on a thread makes a rosary (q.v.). A *bedesman* or *bedeswoman* is one who prays for another. Persons of station and wealth in old times "had regularly appointed bedesmen, who were paid to weary heaven with their supplications." Bedesmen appointed to pray for the king and state, sometimes lived together, and hence *bedehouse* is synonymous with an almshouse. A common form of signature at one time was: "Your bounden bedesman," or, "Your obedient servant."

BEAD, in architecture, a small round molding, sometimes called an astragal. It is of frequent occurrence in architecture, particularly in the classical styles, and is used in picture-frames and other objects carved in wood.



BEADLE is an inferior parish-officer chosen and appointed by the vestry. His business is to attend the vestry, to give notice of its meetings to the parishioners, to execute its orders, to assist the parish constable, and generally to do and execute all the orders and business of the vestry and of the parish, as their messenger or servant. Shaw's *Parish Law*, c. 19. See PARISH; VESTRY. The B. holds his office during "pleasure, and he may therefore be dismissed at any time for misconduct by the parishioners assembled in vestry."

BEADS, a variety of personal ornament, made of various materials, as glass, pottery, metal, bone, ivory, wood, jet, amber, coral, etc., and perforated so that they can be strung on threads and made into necklaces, bracelets, rosaries, etc., or worked on cloth as a kind of embroidery. Their use is of great antiquity, for they are found in the most ancient of the Egyptian tombs as decorations of the dead, and beads supposed to have been used as barter by the Phœnicians in trading with various nations in Africa are still found in considerable numbers, and are highly valued by the natives under the name of "Aggry" beads. Ever since the 14th c., the manufacture of glass beads has been chiefly engrossed by the Venetians, and the glass manufacturers of Murano still produce fully nine tenths of all the beads made; the imports to this country alone in 1872 were 2,093,503 lbs., of the value of £105,488. The manufacture is curious; the melted glass, colored or uncolored, is taken from the pot by two workmen, who slightly expand the gathering by blowing down their blowpipes; they then open up the expanded glass, and join the two together whilst still very soft. This done, they walk rapidly away from each other in opposite directions, in a long shed like a small rope-walk, and draw the glass, which retains its tubular character given by the blowing, etc., into rods of great length, and often extremely small diameter. On cooling, which takes place very quickly, these long rods are broken up into short lengths of about a foot, and a small number of these shorter rods are placed on a sharp cutting edge, after being annealed, and are chopped into lengths. The roughly cut beads are next mixed very thoroughly with fine sand and ashes, then put into a metal cylinder over a brisk fire, and turned round rapidly as they begin to soften with the heat. They are then agitated in water, which cleans away the sand and ashes, and leaves the holes free, after which they are strung.

BEADS, ST. CUTHBERT'S, a title popularly given to the single joints of the articulated stems of encrinites (q.v.). The central perforation permitted them to be strung as beads; and from the fancied resemblance, in some species, of this perforation to a cross, they were formerly used as rosaries, and associated with the name of St. Cuthbert:

> On a rock by Lindisfarn
> St. Cuthbert sits, and toils to frame
> The sea-born beads that bear his name.

They are also known as entrochites, or wheel-stones.

BEAGLE, a small variety of hound, formerly much used in England for hare-hunting. It has now been almost wholly superseded by the harrier (q.v.), to which its name is also sometimes given. The true B. is smaller than the harrier, not above 10 or 11 in. in height at the shoulder, sometimes considerably smaller, stout and compact in make, with long pendulous ears, smooth-haired, sometimes dark-brown, with a streak or spot of white about the neck, sometimes white with black or reddish spots. There appears to have been also a rough-haired variety. The B. is remarkable for its exquisite scent and perseverance; and although much distanced by the hare at first, is almost sure to kill it. It was customary in England, in former times, when beagles were used, to follow the chase on foot, a hunting-pole being employed to assist in leaping. During the chase, the B. gives utterance to a cry which has been regarded as particularly musical; and queen Elizabeth had little "singing-beagles," one of which could be placed in a man's glove. The smaller beads were preferred, perhaps, at first, for the prolongation of the chase; and the diminutive size of a pack or "cry" of beagles became a boast. The smallest are sometimes called *lap-dog beadles*. The origin of the name B. is uncertain.

BEAK. See BILL.

BEAKED, BECQUÉ. When the beak of a fowl is of a different tincture from the body, it is then said, in heraldry, to be beaked of such a tincture. If its legs are of the same tincture, it is then beaked, and membered so and so. In place of beaked, Guillim commonly says "armed."

BEAKER, a term formerly in use, signifying, a kind of drinking-bowl or cup, derived from the same root as the German *becher*, the Italian *bicchiere*, or the barbarous Latin *baccarium*. The Scotch call a hooped wooden dish a "bicker."

BEALE, LIONEL SMITH, b. 1828; an English physiologist and microscopist, professor in the university of London. He has written in opposition to Darwin's theories. Among his productions are *How to Work with the Microscope*, *The Structure of the Tissues of the Body*, *Protoplasm*, etc.

BEAM (Ger. *baum*, Dut. *boom*, Ang.-Sax. *beam*, signify "a tree"), any piece of wood, long like a tree. In the arts, the word has many special technical applications. It is the name, for instance, of three parts of a weaving-loom (q.v.), for a part of the balance (q.v.), and for a part of the steam-engine (q.v.). In ship-building (q.v.), it is applied to

any of the transverse pieces of framing extending across the hull. In ship measurement, it means breadth at the wales. See TONNAGE. B., in engineering, is a strong stay of wood or of iron, for supporting lateral pressure. See STRENGTH OF MATERIALS.

BEAM, of a ship, is one of the main timbers which aid in supporting the decks. Beams stretch across from side to side, aiding to strengthen and uphold the sides of the hull as well as the decks; and they are themselves supported at the ends by massive pieces, called knees, standards, and clamps. Each is made of one fine piece of timber, if possible; but if the length be too great for this, two or more timbers are scarfed together. Wherever it is practicable, the beams are upheld at or near the middle by pillars. In the *Great Eastern* steamship, the beams are of iron, and, like most other parts of the vessel, are cellular in construction. In the old timber-built sailing ships-of-war, now rapidly becoming obsolete, the *beak-head* B. was the broadest in the ship; the *midship* was the longest; the *orlop* was that which supported the orlop deck, and strengthened the hold. The old 74-gun ships had each 24 beams under the lower deck. Many of these characteristics still prevail; but others have given way to change, owing to the increased length of war-steamers, and to the necessity of making room for the machinery. The beams of all ships are generally made deeper in the middle than at the ends, in order that the decks supported by them may have a slight convexity on the upper surface, to carry off the rain-water readily, and to lessen the recoil of the guns.

The position of the beams, stretching across a ship at right angles to the direction of the keel, has given origin to many technical phrases used on shipboard. "On the starboard B." is applied to any distant point out at sea, at right angles to the keel, and on the starboard or right hand—as viewed from the stern—side of the ship. "On the larboard B." similarly applies to the left hand. "On the weather B." is that side of the ship which receives or is towards the wind. "Before the B." is the bearing of any object when seen more in advance than *on* the beam. "Abaft the B." is the reverse of the expression just noted. "On her beam-ends" is applied to the position of a ship when so much inclined to one side that the beams become nearly vertical.

BEAMAN, FERNANDO C., b. Vt., 1814; practiced law in Adrian, Mich., where he was probate judge, presidential elector, and member of congress. He was an early opponent of the extension of slavery. His standing in the legal profession is high.

BEAMING is a handicraft process in the cloth-manufacture preliminary to weaving, and was formerly done by the weaver himself; but it has long since become a special employment, followed by workmen trained to the business as beamers, and, like hand-weaving, is tending to extinction by machinery—warping and beaming, in weaving by power, being conjoined into one operation. See WEAVING. B. is simply the art of winding the web on the weaver's beam in a manner suitable for weaving—the two essential requirements being firmness in the winding on of the web sufficient to withstand the reaction of weaving, and evenness in the spreading of the yarn at the required width. This is effected by what is called a beaming machine, which is simply a kind of roller-mill, extending from end to end of the beamer's shop. The weaver's beam, on which the web is to be wound, is set horizontally on two upright standards at the one end of the shop, and at the other end there is a friction-roller, set likewise level in a heavy frame, fixed to the floor, on which the web is wound like a rope, with the thrum-end out.

The number of pins or strands in the web being known, the beamer has merely to take a ravel (a comb-like utensil) with the corresponding number of teeth in the breadth required for the web, and filling each tooth successively with its respective pin, the spreading is completed; and the web being attached to the beam, the winding on of the web is a common crane operation, in which the tension on the yarn is regulated by the friction on the friction roller. The beamer may thus beam for 400 weavers. The price of beaming a web varies from 3*d.* to perhaps 8*d.* or 10*d.*

BEAM-TREE, WHITE (*pyrus aria*, see PYRUS), a tree of 20 to 40 ft. in height, a native of almost all parts of Europe and of corresponding climates in Asia, not uncommon in the mountainous districts of Britain, and frequently planted. It has been variously referred by botanists to several allied genera, *sorbus*, *cratægus*, and *mespilus*. It has a straight erect trunk, and a round or oval head; the leaves are ovate, cut and serrated (in some varieties, deeply loped), white and downy beneath; the flowers in large terminal corymbs; the fruit scarlet, of the size of small peas. The fruit is acid and astringent, but becomes agreeable by incipient decay; it is sometimes called sorb or service-berry, and resembles the true service (q.v.) in quality, although much smaller. Beer is made of it by fermentation. The wood is very hard and fine-grained; it is used for cogs for the wheels of machinery. The whiteness of the foliage makes the tree—sparingly introduced—ornamental in plantations.

BEAN, *Faba*, a genus of plants of the natural order leguminosæ, sub-order *papilionaceæ*, included by Linnæus and many other botanists in the genus *vicia* (see VETCH), from which it is distinguished chiefly by the leathery tumid pods, spongy within, and by the large scar on the end of the seed.—The COMMON B. (*F. vulgaris*, *vicia faba* of Linnæus) is somewhat doubtfully supposed to be a native of the borders of the Caspian sea; it has been in cultivation from remote antiquity in Europe as well as in Asia. It is

an annual plant, generally from 2 to 4 ft. high, with thick angular stem, leaves with 2 to 5 oval leaflets, and destitute of tendrils. The pods are thick, long, and wooly within; the seeds more or less ovate and flattened. The flowers, which are almost without stalks, are ordinarily white, with a black spot in the middle of the wing: but there is a variety with flowers entirely white, and another in which they are scarlet. The flowers are deliciously fragrant. Burns alludes to this in the lines—

"The zephyr wantoned round the bean,
And bore its fragrant sweets alang."

A field of beans perfumes the summer air for a considerable distance. The varieties and sub-varieties in cultivation are very numerous, differing in the size and form of the seed, the color of the flower, the period which they require for growth, the height, the stem in some unbranched, in others divided at the base into a number of stalks—the pods in some mostly solitary, in others clustered, etc. The B. is cultivated both in fields and gardens, and the seeds (beans) are used for feeding cattle, also for making a sort of meal for human food, and in a green state are put into broths or boiled for the table. They are very nutritious, containing when ripe about 36 per cent of starch, and 23 per cent of legumine, a nitrogenous substance analogous to the caseine of milk. Whether for man or for cattle, however, they particularly require to be mixed with other food. The straw is used for fodder, and is very nutritious when cut before it is fully ripe. The B. succeeds best on a dry and moderately rich soil. A well-drained clay is very suitable for it. Its tapering and deeply penetrating root unfits it for shallow soils. The varieties of B. preferred for the garden are generally much larger, both plant and seed, than those cultivated in the field. The Windsor B. has seeds of a flattened, almost circular shape, fully an inch in diameter; whilst those of the horse B., or tick B., cultivated as a field-crop, are often not more than half an inch in length, and not quite three eighths of an inch in breadth. Garden-beans, in Britain, are usually sown in spring, in rows 2 ft. or more apart; and sowings are made at different dates, that there may be a succession of unripe beans for culinary use. The Windsor, Long Pod, and Early Magazan are among the most approved garden varieties.

The roots of the B. are diuretic, and a decoction of them has been used with advantage in cases of dropsy.

B. crops are very liable to be injured by a species of aphis (q.v.) *A. fabæ*, sometimes called from its color the collier aphis, and sometimes the black dolphin fly, which destroys the leaves, and so renders the plants incapable of bringing the ordinary amount of seeds to perfection. The most effectual remedy known is to cut off the tops of the plants, which are always first attacked, as soon as the aphis appears, and so to prevent its multiplication. The *topping* of beans is regarded by many gardeners as a good practice, even when they are quite free of the aphis.

The kidney B. (q.v.), or haricot (*phaseolus vulgaris*), is an entirely different plant from the common bean.

BEAN, in agriculture. The B. was cultivated to a small extent at least in ancient times, both in Palestine and Egypt. The Roman family of the Fabii are said to have derived their name from this plant. It requires a rich or alluvial land to grow the B. in perfection, and hence it is only found entering into a regular rotation of cropping upon soils of the best class. Since the introduction of maize into the s. of Europe, the land under this plant has been considerably restricted. The maize thrives better, and is far more productive than the B., in warm climates. In the n. of Europe, too, the potato, flax, beet, and other fallow crops are more productive and certain. Indeed, the high summer temperature of the continents of Europe and America is by no means favorable to the growth of the B. In the w. of England, the summers are rather too moist for its yielding its seeds in abundance. The straw and haulm are apt to be developed too much, and the blossoms do not set well. Beans are largely cultivated on all the better descriptions of clay soils in the eastern counties, such as Kent and Suffolk. The variety most generally grown there is the *common tick or field B.*, having much resemblance to the *Scotch or horse-bean.*

The modes of cultivation are very various, and a large breadth is still sown broadcast. The great objection to this mode is the liability of weeds to spring up and check the growth of the crop. Beans are considered one of the fallow crops; but the soil, after it has borne a crop of beans, is little fitted for a cereal crop, unless it has been hoed and kept clean in summer. To effect this end, beans are usually sown in rows, and hoed during their early growth either by the hand or horse-hoe. In preparing the land for a B. crop in England, the stubble, after being liberally dressed with farm-yard manure in autumn, receives a deep furrow, so as to expose the soil to the winter frosts. The surface is then scarified, and after being harrowed, the beans are sown in drills of 18 in. in width, at the rate of 3 to 3½ bushels per acre. The sowing begins as soon after the month of Jan. as the soil admits of the necessary operations, and may be practiced up to the middle of March. The earlier the crop is put in, the better in general is the chance of its being productive. The greater liability of the eastern counties to drought, renders the crop more subject to the attacks of insects, such as the "black dolphin," or *B. aphis*, which usually makes its appearance as soon as the plant suffers from the want of moisture. For this reason, the B. crop is rather an uncertain one in the climate of the eastern coun-

ties, and other crops are gradually encroaching on the breadth which it used to occupy. The Russian or winter beans are sown in these counties to some extent in autumn, and from ripening earlier, often escape the attacks of vermin, and suffer less from the drought.

Perhaps East Lothian is as favorable, in respect both of soil and climate, to the cultivation of the field B., as any part of Europe. The summers are comparatively cool, and the rains generally moderate, and pretty well diffused over the growing season. The crops are less liable to depredations of the "black dolphin," and the long period over which the growth of the plant is extended, is favorable to large crops. Sometimes the crop is sown broadcast, when the land is clean and well manured; and it is said that as large crops have been raised in this way as by sowing in rows. The produce by this mode of cultivation, however, is much more irregular, and the land is often left in a foul condition. Drilling is therefore the general practice in cultivating this crop in the Lothians. The stubble is usually manured and plowed in autumn, and when the weather admits, in spring it is plowed again, and the beans are sown by a small machine in every third furrow; or the land is merely plowed in autumn, and farmed into drills or ridges by the double mold-board plow in spring. Into these the farm-yard manure is put and spread, and the beans are sown above it either broadcast or by a three-barreled machine. The seed is then covered by the double-molded plow, as in the planting of potatoes. By this mode, the plants receive a plentiful supply of nutriment in their early stages of growth. When land is out of condition, or when the crop is sown upon lighter and inferior descriptions of soil, this is perhaps the most advisable method to follow. Mr. Hope, during his tenancy of Fentonbarns, introduced the English method of cultivation into East Lothian. The stubble is dunged and plowed in autumn, and as soon as the land is dry in spring, about three bushels of beans are drilled, 18 in. apart, by means of Garrett's machine. As soon as the crop appears above ground, Garrett's lever horse-hoe is put over the ground, to stir the surface, and keep it free from weeds. During the spring and early summer, the horse and hand hoeing are repeated as often as it is deemed advisable, until the crop covers in the land by its abundant foliage, and keeps down all weeds. Mr. Hope's experiments indicated that the yield of grain is greater by the narrow than by wide drilling.

In England, the crops of beans vary from 20 to 40 bushels per acre; but in dry and warm seasons the produce often falls below the first-named quantity. The weight per bushel is from 60 to 64 lbs. On some of the best soils in Fife, and in the Lothians, as many as 60 bushels per acre are obtained in favorable seasons, and the weight of the bushel is sometimes as much as 66 lbs. In Scotland the straw is more abundant than in England. It forms good fodder both for cattle and horses, as well as supplying material for the dung-heap. Beans are usually cut by the sickle, allowed to lie a few days unbound to winnow, and when bound, put up into *stooks*. In late seasons, when there has been a considerable growth of leaves, they are often long before they are ready for carrying to the stack. Notwithstanding the relatively high price of beans, the breadth under this crop has been diminishing also in Scotland. It is said that the draining of the soil has not been so beneficial to the B. as to other crops. The greater returns which the land gives under potatoes in the B. soils of Fife and the Lothians since the opening of the railways, has encroached upon the extent formerly assigned to it in the six-course rotation. In the Carse of Stirling and Falkirk, it retains its hold much better, and forms the chief preparation for the wheat crop. The field B. is now little used as an article of human food. It is considered to be specially adapted for the feeding of horses which are subjected to hard work. For this purpose, it is usually roughly ground, and mixed with a little bran. In the winter season, a portion is often boiled, and given to them at night. When the price is moderate, a mixture of ground beans and oilcake, or linseed, is much esteemed for milch cows, as well as for fattening cattle and sheep. Special or light manures are less applied to the B. crop than to any other. In many instances, nitrate of soda and sulphate of lime have been used with advantage, but farm-yard manure is almost essential to its free growth.

BEAN-CAPER. See Zygophyllaceæ.

BEAN GOOSE. See Goose.

BEAN-KING'S FESTIVAL, a social rite principally observed in France, from which country it would seem to have been transplanted to Germany. On the evening of Twelfth day (q.v.), or, as the Germans call it (in allusion to the legend, that the wise men of the east who came to worship Christ were three kings), Three Kings' day (*Dreikönigstag*), companies assemble to spend a few hours in mirthful relaxation. A large cake is baked, with a bean hidden somewhere in it. The cake is then divided into pieces, each person present receiving one, and whoever obtains the piece with the bean is king for the year. In this capacity he holds a mock-court, and receives the homage of the company, who also amuse themselves with other diversions. The bean king, however, is compelled to pay for his dignity, for he has to give an entertainment on the next Twelfth night, that an opportunity may be afforded to choose another king. In France, this custom was at an earlier period so common, that even the court indulged in it, although the church, in the 17th c., exerted itself zealously for its suppression. The opinion that the B. K. F. owes its origin to the Roman saturnalia, when even the chil-

dren, partaking in the universal glee, were wont to elect a king, is not destitute of probability.

BEAR, *Ursus*, a genus of quadrupeds, the type of a family called *ursidæ*, belonging to the order *feræ*, sub-order *carnivora*, and tribe *plantigrada*. In the ursidæ or B. family, are included not only the true bears, but also badgers, gluttons, and wolverines, racoons, coatimondis, binturongs, the kinkajou, the panda, etc. (See these articles.) Walking on the whole sole of the foot (plantigrade), the animals of this family are not, in general, capable of running very swiftly; and the nearly equal length of their fore and hind legs unfits them for leaping; most of them are also heavy both in form and gait. But whilst thus deficient in the powers which other carnivorous animals possess for obtaining prey, they really exhibit the same beautiful mutual adaptation of endowments and wants; they are, in fact, by no means strictly carnivorous; no animals are more thoroughly omnivorous than some of them; whilst others, even of the true bears, always give a decided preference to vegetable food when it can be obtained, and their teeth and digestive organs are in exact accordance with such tastes. Their jaws are much more elongated than those of feline animals, and their bite proportionally less powerful, although some of the bears are still very formidable from their great general strength and the size of their canine teeth. Their claws are not retractile, and are adapted for digging in the earth, or for climbing trees, rather than for seizing prey. All animals of the family have five toes to each both of the fore and hind feet.

Bears have six cutting teeth above, and six below, one canine tooth on each side in each jaw, with four false molars and two molars (or grinders) on each side above, and four false molars and three molars below. The false molars are, in general, soon lost by the more carnivorous species. The true molars are very large and tuberculous, the false molars comparatively small. The tuberculous crowns of the molars exhibit the adaptation to vegetable food.—The tail in all species of B. is very short, so that some of them almost appear tailless. Most of them may be described as nocturnal in their habits.

Bears are found in Europe, Asia, and North and South America, and both in warm and cold climates, the species belonging to cold climates being in general the most fierce and carnivorous. The ancients mention them as occurring in Africa; it must, therefore, be regarded as a curious circumstance that no recent accounts make certain the existence of any species in that continent. Nor is any known to belong to Australia.

The common B. of Europe, or brown B. (*Ursus Arctos*), was at one time a native of the British islands. Bears were carried from Britain to Rome, for the cruel sports in which the Romans delighted, and they certainly were not exterminated in Scotland before the latter part of the 11th century. The brown B. is usually about four ft. long, and two and a half ft. high. Its claws are about two in. long, and much curved. It has a convex forehead, and generally a brown fur, which is somewhat woolly in the younger animals, but becomes smoother with age. It produces from one to three young ones at a birth, which remain blind for about four weeks. It is generally believed to be the only European species, although different varieties occur; and one, the black B., has been regarded by some naturalists as specifically distinct. The common B. is very widely distributed over the whole of Europe and of the n. of Asia, Japan, and North America. In America it is known as the Barren Ground Bear. It is a solitary animal, and generally inhabits mountainous regions or thick forests. It sometimes preys on lambs, kids, etc.; is fond of fish, which in some countries, as in Kamtchatka, constitute a great part of its food; climbs trees in quest of honey, eats also fruits and vegetables, and in confinement, exhibits a strong appetite for bread. It usually prefers vegetable to animal food. The skin is valued for making fur-cloaks, etc.; the flesh is used as food, often in the shape of hams, as is that of the American Black B.; the paws are esteemed a delicacy. The fat (bear's grease) is in great request as an unguent for the hair. The intestines are used in Kamtchatka, instead of glass, for windows. To the people of Kamtchatka, indeed, bears, which are there very abundant, afford many of the necessaries and comforts of life.—The common B., like others of the genus, in cold climates, usually spends the winter in a torpid state. It selects a cavern or the hollow of a tree for its hybernation, or makes a hole for itself by digging; it is also said, but this needs confirmation, sometimes to construct a sort of hut with branches of trees, lined with moss. The winter being spent without food, it is said to be very lean on the return of spring. This and other species of B. are very often killed in their winter dens.

The American black B. (*ursus Americanus*) is found in all parts of North America. Its total length seldom exceeds 5 feet. The fur is soft and smooth, and generally of a glossy black; but there are varieties of other colors, as the cinnamon B., the yellow B., etc. The American black B. usually exhibits a timid disposition; seldom attacks man; feeds chiefly on berries, when they can be obtained; occasionally visits gardens for the sake of cabbages and other vegetables; and strongly prefers vegetable to animal food, but has recourse to the latter when pressed by hunger, and in such circumstances occasionally approaches human habitations and captures pigs, which it endeavors to carry off. In such cases the B. walks on its hind-legs, the pig being firmly squeezed between its fore-paws and breast, making a noise which frequently leads to a rescue. This and other species of B., when assailed, not unfrequently hug their adversaries in the manner here described, when their strength renders them very dangerous. The skin of the

American black B. is used for caps, rugs, etc., and great numbers are annually killed upon this account, chiefly by the Indians in the employment of the Hudson's bay company. Almost 10,000 skins are annually imported into Britain, of which, however, the greater part are again exported. In the beginning of the 19th c., the number imported was more than twice as great as now; the skins were also of much higher price. A B.'s skin is still worth from £1 to £3.—The grizzly B. (*U. ferox*) of North America, found chiefly on the Rocky mountains and the plains to the eastward of them, from Mexico to lat. 61° n., is much larger than either of the species already noticed, and much more fierce and carnivorous. It sometimes measures more than 9 ft. from nose to tail, and the claws of the fore-feet more than 6 in. in length. It has a lengthened and narrowed muzzle, a very short tail, and long grizzled hair. No animal of the new world is more formidable than the grizzly B. It is capable of overpowering the bison, and dragging away the huge carcass. It feeds, however, also on fruits and roots.—The arctic B., or polar B., also called the white B. (*U. maritimus*), resembles this species in size and fierceness, but is very distinctly characterized by its flat head and comparatively long neck. It has a smooth white fur. It is the only known species of B. which is strictly marine in its habits, never being found far from the sea. It inhabits the most northerly shores of Asia and America, Spitzbergen, etc., where it pursues seals, both in the water and upon the ice, and preys upon fishes, birds, etc. Amongst the articles of its food are eggs and berries in their season, and in confinement it will subsist long on bread and other vegetable food. Like other species of the genus, it displays great affection for its young, and will brave all dangers in their defense.—Of other species of B., the Syrian B. (*U. Syriacus*) may be mentioned, as perhaps the species particularly intended by the name B. in the Old Testament. It is generally of a dingy-white or brown color, and has a stiff mane of erect hairs between the shoulders. Flocks are not safe from it, yet it more frequently commits ravages on crops of pulse. In its habits generally, it much resembles the common B.; as do also the Thibet B. (*U. Tibetanus*), and the spectacled B. (*U. ornatus*), so called from semicircular yellow marks above its eyes, a native of the Andes of Chili.—The long-lipped B., or sloth B. (*U. labiatus*), of the East Indies, is the kind commonly led about by Indian jugglers. Its long hair, short limbs, high back, peculiarly uncouth appearance, and gentleness of disposition, recommend it for this purpose. In a wild state, it is said to feed chiefly on fruits, honey, and ants. It possesses in a remarkable degree the power, common in some measure to all the bears, of protruding the lips in order to lay hold of food.—Some other East Indian species, which feed chiefly on fruits and honey, are known as sun-bears, as the Malayan B. (*U. Malayanus*) and the Bornean B. (*U. eurysplus*). They are characterized by an extremely long extensile tongue. They are of gentle disposition, and become very affectionate when tamed. Sir Stamford Raffles had a Malayan B., which was very playful and quite harmless, although a powerful animal, and which showed refinement of taste in refusing to eat any fruit but the mangosteen, or to drink any wine but champagne. This species in a wild state does much damage to cocoa-nut plantations, by climbing the trees, and eating off the terminal bud, when it is said also to drink the sap (toddy) which flows out in abundance.

Remains of several extinct species of B. have been discovered in caves in Germany, England, and other countries, some of which appear to have been larger than the present bears of Europe, and of more decided carnivorous propensities. Of these, the *U. spelæus*, or great cavern B., has the skull of considerable vertical elevation from the upper end of the muzzle, and larger than that of the biggest brown bear. The *U. arctoideus* has a skull nearly of the configuration of that of the *U. Americanus*, and of the size of that of *U. spelæus*. The *U. priscus*, or ancient B., has the skull of a smaller size, and differing less from that of living bears.

Ant B. is a name of the great ant-eater (q.v.).

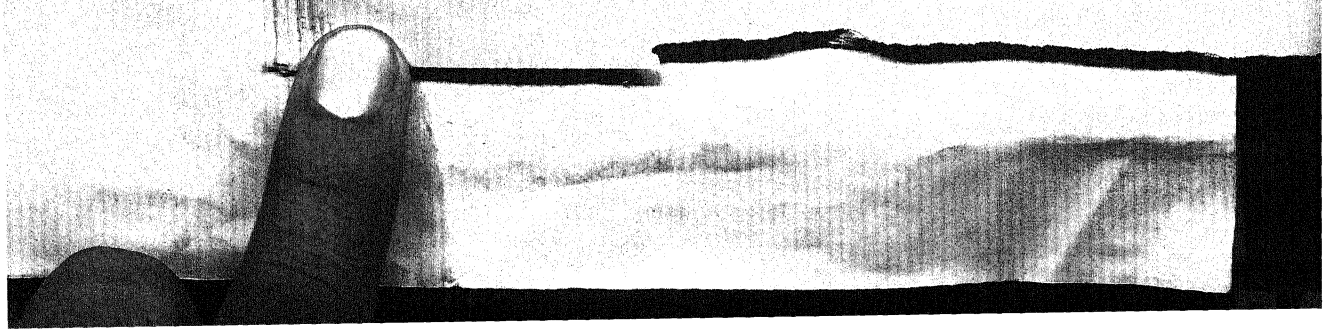
BEAR, Bere, or Beer. See Barley.

BEAR, Great and Little. See Ursa Major and Minor.

BEAR-BAITING. In different countries, bears were formerly made objects of cruel sport, by being baited with dogs. In England, B. was one of the established amusements, not only among the common people, but among nobles, and even royalty itself; it is related that queen Elizabeth did not consider it unbefitting her sex or rank to attend these rude entertainments. Pennant, in his *Zoology*, quoting from *The Household Book of the Earls of Northumberland*, says: "Our nobility also kept their bearward; twenty shillings was the annual reward of that officer from his lord, the fifth earl of Northumberland (who died 1527), 'when he comyth to my lorde in Christmas, with his lordshippe's beests for making his lordschip pastyme the said twelve days.'" The places where bears were kept and publicly baited were called bear-gardens. There is a spot in the neighborhood of the court at Westminster, which, until lately, was known as the bear-garden. B., like bull and badger baiting, has long been unknown in England.

BEARBERRY. See Arbutus.

BEARD, the hair which grows on the upper lip, and on the chin and cheeks of the male sex. It is usually, though not always, of the same color as the hair of the head, but somewhat shorter, stronger, and more wiry; it is invariably the color of the hair on



the eyebrows. The B. is the distinctive sign of manhood. In women, an incipient B. sometimes appears in the later years of life. Instances also occur of women with a B. almost equal to that of the male sex, but these are recorded as prodigies. The B. is generally luxuriant in persons of the Slavic and Celtic races. The aborigines of America, who are naturally almost beardless, make themselves entirely so by plucking out the hairs of the beard. In early times, the B. was considered by almost all nations a sign of strength and an ornament of manhood, was carefully cherished, and even regarded as sacred. Among the Turks, Arabs, Persians, and many other nations, the removal of the B. was, and is yet to a very great extent, regarded as a severe punishment and an extreme degradation. The case of David's ambassadors, recorded in 2 Samuel, chap. x., illustrates the same feeling as prevalent among the ancient Jews. The Moslems carry combs constantly about with them for the purpose of dressing the beard. It is common to do so immediately after prayers, the devotee remaining on his knees during the operation. The hairs that fall out are then carefully picked up and preserved for entombment with their owner when he dies; frequently he himself deposits them beforehand in his destined tomb. The ancient Jews did not dye their beards, and the Turks rarely, but the practice was common among the Arabs and Persians. The Arabs dyed the B. red, not only because dye of that color (being merely a paste of *henna* leaves) was easily obtainable, but because it was an approximation to golden yellow, the color recommended by their prophet Mohammed, who hated black, the color the Persians preferred. The Persian kings are said to have interwoven their beards with gold thread. It is customary among the Turks to anoint the B. with perfume, and to smoke it with incense. The Jews also anointed their beards. The Moslems commonly clipped their whiskers, the Jews did not. The Egyptians shaved their beards except in time of mourning, when they let them grow. From some of the ancient Egyptian statues, however, it would appear that beard-cases were worn, which would seem to indicate that the practice of shaving was not universal. The fashions of beards have been very different at different times and in different countries.

A neglected B. was a sign of mourning among the Jews. According to Levi's *Succinct Account of the Rites and Ceremonies of the Jews at this Present Time*, they are forbidden to shave or cut their nails, or bathe for 30 days after the death of a father, mother, brother, sister, son, daughter, wife, or husband. In Greece, the B. was universally worn till the time of Alexander the great, who ordered shaving, that the beards of his soldiers might not be laid hold of by their enemies in battle. Shaving was introduced among the Romans about 300 B.C. Pliny says Scipio Africanus was the first Roman who shaved every day. Subsequently, the first day of shaving was regarded by the Romans as the entrance upon manhood, and celebrated with great festivities. Under Hadrian, the B. was allowed to grow again; and this fashion prevailed till the time of Constantine the great, when it was discontinued. Peter the great compelled shaving in Russia by imposing a heavy tax upon the B., and further, by having the beards of all whom he found wearing them plucked out by the roots, or shaved with a blunt razor. The B. was commonly worn in France till the time of Louis XIII., when, because the monarch was young and beardless, the fashion changed at the court and throughout the kingdom. A similar change took place in Spain on the accession of Philip V. With regard to our own country, the Anglo-Saxons wore beards for a considerable time after their invasion of Britain; and the B. appears to have been general among the people at the time of the Norman conquest. But the Normans not only shaved themselves, but compelled the conquered to do so likewise; and many of the English preferred to leave the country rather than submit to have their whiskers shaved. It would appear, however, from the sculptured representations on the tombs of kings and nobles, that not very long after the conquest some of the Normans adopted the custom they had prohibited among the vanquished. Edward III. is represented on his tomb in Westminster abbey with a very long beard. In the time of Elizabeth, beards were of the most varied and fantastic cut. Taylor, the "water-poet," thus satirizes the extravagance of beards prevailing in that and the succeeding reign:

> Some seem as they were starched stiff and fine,
> Like to the bristles of some angry swine;
> Some cut and pruned like to a quick-set hedge,
> Some like a spade, some like a fork, some square,
> Some round, some mowed like stubble, some stark bare;
> Some sharp stiletto-fashion, dagger-like,
> That may with whispering, a man's eyes out-pike,
> Some with the hammer-cut, or Roman T,
> . . . . . .
> That heights, depths, breadths, triform, square, oval, round,
> And rules geometrical in beards are found.

The B. gradually declined under Charles I.; in the reign of Charles II., whiskers and mustaches only were worn; and the practice of shaving the whole face soon became general all over Europe; and it is only within the last 70 years that the B. has been in some measure restored, the soldiers of Bonaparte setting the example. But until within the last 30 years, it was regarded by some of the continental governments as a badge significant of democratic sentiments, and as such was interfered with by police regulations. Physicians recommend that the B. should be allowed to grow on the chin and

throat in cases of liability to inflammation of the larynx or of the bronchiæ; and mustaches and whiskers are reckoned useful for prevention of toothaches and nervous diseases of the face. The British soldiers in the Crimea were allowed to wear their beards; and with some limitations, the British army generally are now permitted to do so. The wearing of the B. has, in short, been a matter of fashion in all ages and countries—an extreme in one way usually leading to an extreme in the other. At present, the tendency in England and elsewhere is to let the B. grow, though in a way suggested by the taste of the individual. The B. is itself liable to the same diseases with the hair of the head, and to a peculiar disease (*mentagra*) occasioned or kept up by shaving, consisting in a bark-like exudation from the inflamed sebaceous glands of the hair. For detailed information, see Kitto's *Pictorial Bible;* Bulwer's *Artificial Changeling* (Lond. 1653); Hotoman's *Pogónias* (Leyden, 1586), reprinted in the *Lexicon* of Pitiscus; Taylor's *Whip of Satire*, etc.

BEARD, JAMES H., b. N. Y., 1815; brought up in Ohio, and began to paint portraits at the age of 14; settled in Cincinnati, and became conspicuous in his profession. In 1846, he exhibited his first composition, "The North Carolina Immigrants," which gave him a national reputation. Among later works are "The Land Speculator," "The Long Bill," "Out all Night," etc. He has painted portraits of Clay, Harrison, Taylor, and many other public men.

BEARD, RICHARD, D.D., b. Tenn., 1799; graduate of Cumberland college, and in 1843 president thereof; from 1854 professor of systematic theology in the same institution. He is a leader in the Cumberland Presbyterian organization, and his work on *Systematic Theology* is the embodiment of their doctrines. Dr. B. has been a zealous worker for the church and for the education of the people.

BEARD, WILLIAM H., b. Ohio, 1824; brother of James H. and also a painter. He began portrait-painting when young; visited Europe, and settled in New York in 1860. His compositions are mostly grotesque or satirical; some of them are "Bears on a Bender," "Dance of Silenus," and "Court of Justice."

BEARDIE. By this name is the little fish called the loach known in Scotland. See LOACH.

BEARD MOSS. See USNEA.

BEARDSTOWN, seat of justice of Cass co., Ill., on the Illinois river, and the Rockford, Rock Island and St. Louis railroad, at the terminus of the Springfield and Illinois Southern railroad; pop. 2528. It has some manufacturing establishments, and good trade in agricultural products.

BEARING, of a ship at sea, is the direction in which she sails, in reference to the points of the compass. Or, in a more comprehensive sense, it is the direction in which each of two objects is situated in reference to the other. When the latitudes and longitudes of two places are known, their respective bearings from each other can be calculated by trigonometry. On shipboard, seamen often conveniently refer the B. of another ship, or of an object on shore, not to the points of the compass, but relatively to the line followed at the moment by the ship's keel. Thus, the B. of the distance object may be *ahead, astern*, on the *starboard bow*, on the *larboard quarter*, etc.; the bow being between the head and the midship, and the quarter between the midship and the stern.

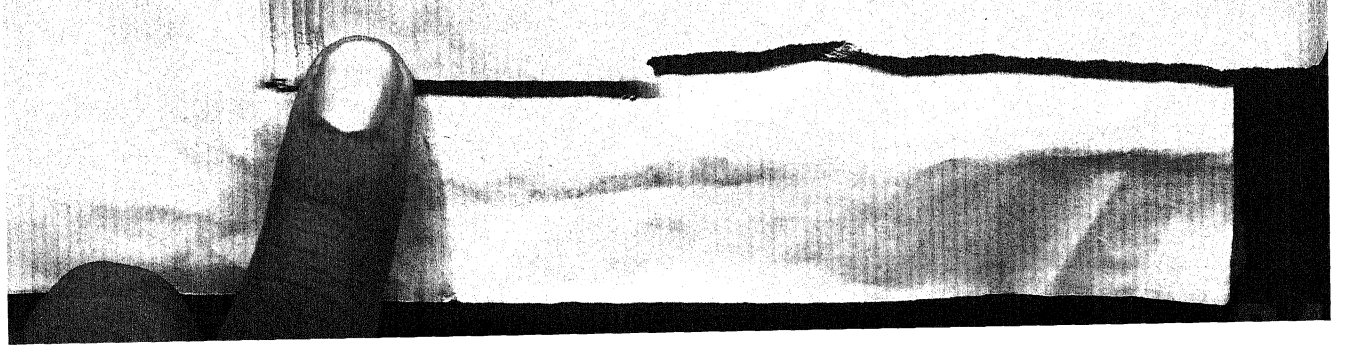
Bearing, or rather the verb *to bear*, is much used as a technical direction on shipboard. Thus, to "bear in with the land," to "bear off from the land," to "bear up," to "bear away," etc., are nearly equivalent to sailing, or steaming, or steering, in such and such directions.

BEARING THE BELL, a phrase which signifies to take the lead or first place in anything, or to carry away the prize. This old colloquial phrase is said to have originated in a practice, at the early part of the 17th c., of giving a small golden or silver bell as a prize to the winner at horse-races. See BELL. In Dudley lord North's *Forest of Varieties*, p. 175, we read:

> Jockey and his horse were by their masters sent
> To put in for the bell—
> Thus right, and each to other fitted well,
> They are to run, and cannot misse the bell.

BEAR LAKE, GREAT, in British America, in n. lat. 65° to 67°, and w. long. 117° to 123°. It is the most northerly of that chain of fresh-water seas—Huron, Superior, Winnipeg, Athabasca, Great Slave, Great Bear—which mark a continuous hollow in the middle of the continent. Great Bear lake is irregular in shape, with a surface estimated at 14,000 sq.m., equal to about half the area of Scotland. It sends forth a river of its own name to the Mackenzie. Its height above the ocean is computed at 230 feet. The climate is, of course, severe. The rigor of the winter may be inferred from the fact, that boats are sometimes blocked up by solid ice, after the crews have begun to suffer from the heat and the mosquitoes.

BEAR-LEADER. In former times, bears were led about with a chain, muzzled, and made to dance or stand on their hind-legs for popular entertainment, small dancing-dogs being usually added, for the sake of attractiveness. As a measure of police, these



somewhat dangerous and painful exhibitions are now stopped. From this old practice has been taken the phrase, bear-leader, now used jocularly to signify a discreet person who takes charge of a youth of rank on his travels to see the world.

BEAR MOUNTAIN, in Dauphin co., Penn., containing valuable beds of anthracite. The "mountain" is only about 760 ft. high.

BEARN, formerly one of the 32 provinces into which France was divided, and now forming the greatest portion of the Basses-Pyrénées. B. was a portion of Aquitania under the Romans, and after the downfall of that empire, under its ruling dukes, it was a country of considerable importance. From the intermarriage of the ruling family, the counts of Foix, with that of Navarre, sprang the French monarch Henry IV., who, because he was born and brought up in B., was derisively called the Bearnois. When he ascended the throne of France, it, of course, virtually became a part of that country; but was only formally incorporated with it in 1620 by Louis XIII. In 1813, after the British had crossed the Nive, and established themselves in Urogne, St. Jean de Luz, etc., the rich fields of B. furnished them ample supplies, the peasants taking their produce, for which they were well paid, as regularly to the British stations as to market.

BEAR-PIT, a pit prepared for the keeping of bears, usually seen in zoological gardens. A pit of this kind is circular, measuring about 25 ft. in diameter, and 20 ft. deep. The sides are built with brick; the bottom is level, and paved with stone; and around are vaults with doors for the residence of the bears. From the center of the pit rises a stout and tall pole, on which are cross-spars at proper distances, to enable the bears to climb to the top. As is well known, the animals are fond of climbing up these poles, and catching morsels of bun from the visitors. The poles are sufficiently distant from the sides to prevent the bears from leaping out. The vaulted receptacles require to be cool and dry.

BEAR RIVER, in Utah; 400 m. long; flows into and out of Idaho, and empties into Great Salt lake. There are magnesian and other mineral springs on its banks. Coal is found where the Central Pacific railroad crosses. One of the peculiar features is a group of soda springs occupying 6 sq. miles.

BEAR'S GREASE. Under this name there are sold by perfumers and others, large quantities of pomades, tastefully done up for the toilet, and which are represented to be of great efficacy in nourishing and promoting the growth of hair. These so-called preparations of B. G. are for the most part composed of purified beef-marrow, hog's-lard, or fat of veal, and spermaceti, along with almond oil, and some scenting ingredients. The genuine bear's fat or B. G. would appear to possess the virtue of encouraging the growth of, and strengthening the hair, in an eminent degree; but the scarcity of the commodity is such that substitute fats are employed to supply the demand. See HAIR.

BE'AS, anciently *Hyphasis*, one of the five rivers which give name to the *Punjab*, or land of five waters—Jelum, Chenab, Ravee, Beas, and Sutlej. It rises on the verge of the Ritanka pass of the Himalaya, in lat. 32° 34′ n., and long. 77° 12′ e., its source being 13,200 ft. above the sea-level. After a course of about 220 m., it joins the Sutiej, 35 m. to the s.s.e. of Amritsir. It is subject to periodical rises and falls, being in the dry season generally fordable; but after the rainy months, it is sometimes nearly half a mile in breadth about 20 m. above the point of confluence.

BEASLEY, FREDERICK, D.D., 1777–1845; b. N. C.; an Episcopal clergyman; from 1813 to 1828 professor of moral philosophy in the university of Pennsylvania; author of a defense of Locke called *Search of Truth in the Science of the Human Mind*; also of works in opposition to the doctrines of Dr. Channing.

BEAT, in music, a species of embellishment written thus:  , and played as follows:  . Beat also means a signal given by the hand or foot in music to insure simultaneous performance—the hand or foot being raised on the unaccented, and lowered on the accented part of the bar.

BEAT, IN MUSIC (*ante*), a term used in the plural for the pulsations or throbbings resulting from the vibrations of two sounds of the same strength and nearly the same pitch, or two sounds alike in intensity but not in exact unison. In tuning unisons, as in the case of two or more pipes or strings, the operation is guided by beats; until the unison is perfect, more or less of beating will be heard; when the unison is very defective, the B. have the effect of a rattle. The complete absence of B. affords the best means of attaining by trial a perfect harmony.

BEATIFICATION, is a solemn act in the Catholic church, by which the pope, after scrutinizing the life and services of a deceased person, pronounces him blessed. After this he may be worshiped in a specified portion of the church, and the act holds out the prospect of future canonization, which entitles him to general worship in the church universal. B. was introduced in the 12th century. It may be regarded as an inferior degree of canonization (q.v.).

BEATING AND WOUNDING, or simply *wounding*, is the name sometimes found in law-books for the offense of inflicting on another some dangerous hurt or wound; and it has

been otherwise described as an aggravated species of battery (q.v.). A still more aggravated and atrocious offense of this kind used to appear in the list of offenses against the criminal law of England under the term MAYHEM, which was a violently depriving another of the use of a member proper for his defense, such as an arm, a leg, a finger, an eye, a fore-tooth, and some others; but it was laid down quaintly enough, that the loss of one of the jaw-teeth, the ear, or the nose, was no mayhem in common law, because these members can be of no use in fighting.

The offenses to which we have referred—viz., *battery, beating and wounding*, and *mayhem*—can, however, be best considered under the important and well-known term ASSAULT, which is indeed often used to express the above injuries, and which is implied in them all. The above offenses, it will have been observed, all involve an actual attack on and injury to the person of the party assaulted. But there may be an assault without such actual hurt. This is a *common assault*, and hence, in criminal law, assaults are distinguished by their being *common* or *aggravated*. A common assault has been defined as an attempt or offer to do a corporal hurt to another, as by striking at another with a stick or weapon, or without a weapon, though the party striking misses his aim. The principal is, that it is sufficient, in order to constitute such an offense, that there has been such an exhibition of a violent and offensive *animus* as to show at once the intention, and the power, to commit it. So, drawing a sword or bayonet, or even holding up a fist in a menacing manner, throwing a bottle or glass with intent to wound or strike, presenting a gun at a person who is within the distance to which the gun will carry, pointing a pitchfork at a person who is within reach, or any other similar act, accompanied with such circumstances as denote at the time an intention, coupled with a present ability, of using actual violence against the person of another, will amount to an assault.—Russell on *Crimes and Misdemeanors*, vol. i. p. 750. It has even been laid down, that to present a pistol, purporting to be loaded, so near as to produce danger to life if the pistol had gone off, is an assault in point of law, although, in fact, the pistol was not loaded.

But no *words*, however provoking or irritating, can amount to an assault. On the other hand, the injury need not be effected directly with the hand of the person making the assault. Thus, there may be an assault by encouraging a dog to bite, by riding over a person with a horse, or by willfully and violently driving a cart, etc., against the carriage of another person. Nor is it necessary that the assault should be immediate, as where a defendant threw a lighted squib into a market-place, which, being tossed from hand to hand by different persons, at last hit the plaintiff in the face, and put out his eye, it was adjudged that this was actionable. And the same has been held where a person wantonly pushed a drunken man against another, and thereby hurt him. A defendant put some cantharides into coffee, in order that a female might take it; and she did take it, and was made ill by it; and this was held to be an assault. It is also an assault, willfully and of malice, to expose another to the inclemency of the weather; so is the taking indecent liberties with females without their consent, although they did not actually resist; and to such indecent liberties a very wide application has been given, even to the extent of holding a medical practitioner guilty of assault, who stripped a young girl of her clothes, on the pretense that he could not otherwise judge of her illness. Philanthropists and benevolent people will likewise be glad to be told, that not only does the striking that takes place at a *prize-fight* constitute an assault as between the combatants themselves, but all persons present in concert and co-operation may be punished as aiders and abettors. Again, an assault may be committed by unlawfully imprisoning or detaining the person of another; and by such detention is meant every confinement of the person, whether it be in a common prison or in a private house, or by a forcible detaining in the public streets. Numerous other cases could be stated, showing how nicely and protectively the law on this subject has been elucidated; but the explanation we have given is sufficient for its popular illustration.

Generally, it may be laid down, that the essential thing is the *intention* with which the alleged act is done, so that no matter how violent or menacing the conduct of the accused may have appeared to be, nor even how serious the injury, if it can be shown that the whole was unintentional or accidental and undesigned, there is no assault. It remains to be added on the subject of common assaults, that the party injured may proceed against the defendant summarily or by action or indictment for the same assault; but the court in which the action is brought will not compel him to make his election to pursue either the one or the other. Yet if the party has obtained a conviction before justices of the peace, this will be a bar to any other remedy, civil or criminal; and if the justices grant a certificate that it was not proved, or was trifling, this also, as must be quite apparent, will be a bar.

With respect to *aggravated* assaults, their special character arises from the great criminality of the object intended to be effected. Thus, attempts to murder, or to do great bodily harm, to ravish, and to obstruct officers of the law in the execution of legal process, are all of the nature of aggravated assaults; as are also attempts to commit robbery or any other felony. The remedy for an aggravated assault is usually by indictment, but justices of the peace may also, at least in the first instance, decide some cases. In certain cases the punishment is regulated by recent statutes: thus, by the 24 and 25 Vict. cc. 96, 100, it is enacted that persons unlawfully and maliciously starving an

apprentice or servant, whereby the life of such person shall be endangered, or the health injured, shall be guilty of a misdemeanor, and on conviction may be imprisoned, with or without hard labor, for any term not exceeding two years; and where the offense shall be against a young person under the age of 16 years, and shall amount in point of law to a felony, or to an attempt to commit a felony, or to an assault with intent to commit a felony, the guardians of the union or parish, or, where there are no guardians, the overseers of the parish, are authorized and required to prosecute, the costs of the prosecution being paid out of the common fund of such union or parish. Again, by an act of 24 and 25 Vict. c. 100, it is declared expedient to make further provisions for the punishment of aggravated assaults, and it is therefore enacted that if any person shall unlawfully and maliciously inflict upon any other person, either with or without any weapon or instrument, any grievous bodily harm, or unlawfully and maliciously cut, stab, or wound any other person, every such offender shall be guilty of a misdemeanor, and being convicted thereof shall be liable to three years' penal servitude, or to be imprisoned, with or without hard labor, for a term of two years: provided, however, that nothing contained in the act shall be deemed or taken to repeal other enactments of the act, by which it is provided that if any person shall unlawfully and maliciously, by any means, wound any person, so as thereby to endanger the life of such person, or so as thereby to inflict upon such person any grievous bodily harm, every such offender, being convicted thereof, shall be liable to be sentenced to penal servitude for life, or for the term of three years, or to be imprisoned, with or without hard labor, in the common jail or house of correction, for any term not exceeding two years; and, if a male, to be once, twice, or thrice publicly or privately whipped, in addition to such imprisonment, if the court shall think fit. The only other enactment that it may be necessary to notice is one in the same statute of 24 and 25 Vict. c. 96, which provides that any person convicted of any indecent assault, or of any assault occasioning actual body harm, shall be liable to be imprisoned for any term now warranted by law, with hard labor during the whole or part of such imprisonment.

In Scotland, the principle of the law of assault, and of its aggravations, is very much the same as that above stated. In the Scotch system it is laid down that it is of the utmost importance in all cases of actual assault to ascertain who struck the first blow, and the party who receives it will be excused for retaliating, if he do not exceed the just and fair measure of resentment. There, too, the highest of all aggravations is the assault with intent to murder. It is also an aggravation that the assault has been committed in pursuance of an old grudge, and on a principle of revenge; where, also, the offense has been accompanied with an intent to compel a rise of wages, or to deter from working at a certain rate, or in pursuance of a combination entered into for these illegal purposes. Another aggravation of the offense in Scotland is its being committed by a child on its parent, by a husband on his wife, or by any person upon another within his own house, although the latter crime falls more strictly under the antiquated term of *hamesucken* (q.v.). The remedy in Scotland is, as in England, by civil action of damages, and by a criminal prosecution, both being maintainable, and the latter usually at the suit of the lord advocate, as public prosecutor; but the private injured party may prosecute criminally should the lord advocate decline to so. See, on the subject of this article generally, Russell *On Crimes and Misdemeanors*, in England, and Alison's *Principles of the Scotch Criminal Law*.

BEATING JUDGES, in the Scotch law, is the strange title of a strange offense, according to the enlightenment of the present age—namely, that of committing a personal assault on a judge. By the provisions of an old statute now in desuetude, an assault on a judge sitting in court is a capital offense.

BEATING THE BOUNDS is the popular expression in England for those periodical surveys or perambulations by which the ancient boundaries of parishes are preserved. The procedure, according to common custom, is in this wise: On Holy Thursday or Ascension day, the clergyman of the parish, with the parochial officers and other parishioners, followed by the boys of the parish school, headed by their master, go in procession to the different parish boundaries, which boundaries the boys strike with peeled willow-wands that they bear in their hands, and hence the expression beating the bounds. The correct legal term is *perambulation* (q.v.). See Brand's *Popular Antiquities*, vol. i. pp. 174, 175; Lyson's *Environs of London*, vol. ii. p. 146; Hone's *Every-day Book*, vol. i. p. 651; Steer's *Parish Law*, by Hodgson; and Toulmin Smith's *Parish Law*.

According to these and other old authorities, the beating was not confined to the above performance of the boys with their willow-wands; but where it was desired to preserve evidence of particular boundaries, the singular expedient was used of whipping the boys themselves on the spot, or one of them, who received a stated fee for the permitted castigation out of the parish funds—it being thought that the impression made on the memory of the whipped boy was calculated to have a beneficial effect on the preservation of his evidence. A similar ceremony appears anciently to have prevailed in Scotland, and for the same purpose. See lord Stair's *Institutes of the Scotch Law*, book iv., title 43, s. 7, where it is stated that the boys were "sharply whipped."

BEAT OF DRUM, in military matters, is a signal or instruction conveyed by a particular mode of drum-beating. It is an audible semaphore, a telegraph that speaks to

the ear instead of the eye. There are many varieties, known by the names of the general, the reveillé, the assembly, the foot-march, the grenadiers' march, the retreat, the taptoo or tattoo, the call to arms, the call to church, the pioneers' call, the sergeants' call, the drummers' call, the chamade, the rogue's march, the long roll, etc. Some of the same instructions or commands are also given by the bugle, and some by the trumpet.

BEA'TON, or **BE'THUNE**, DAVID, cardinal and primate of Scotland, a zealous opponent of the reformation in that country, descended from a celebrated French family, was a younger son of John Beaton of Balfour, Fifeshire. Born in 1494, he became, in Oct., 1511, a student at the university of St. Andrews, and afterwards studied theology and the canon and civil laws of Paris. Early entering the church, he was preferred by his uncle, James Beaton, archbishop of Glasgow, to the rectory of Campsie, Stirlingshire. His tact and general abilities recommended him to the duke of Albany, regent during the minority of James V., who, in 1519, appointed him resident for Scotland at the French court. In 1525, he took his seat in the Scots parliament as abbot of Arbroath; his uncle, on being translated two years before to the archbishopric of St. Andrews, having resigned to him that abbey, with the half of the rents. In 1528, B. was appointed lord privy seal, and is said to have been the adviser of James V., in instituting the college of justice or court of session in Scotland, the idea of which was suggested by the constitution of the parliament of Paris. B. subsequently became prothonotary public, and was twice sent ambassador to France, to negotiate James's two marriages—first, with the French king's daughter, princess Magdalene, who died six months after her nuptials; and secondly, with Mary, duchess of Longueville, daughter of the duke of Guise. The king's union with the latter he solemnized, in 1537, in the cathedral church of St. Andrews. During his residence at the French court, he was admitted to all the privileges of a French citizen, and appointed by Francis I. bishop of Mirepoix in Languedoc. After his return, he became coadjutor to his uncle in the see of St. Andrews, and on 28th Dec., 1538, on the recommendation of the king of France, was, by pope Paul III., elevated to the dignity of a cardinal. On his uncle's death, in 1539, he succeeded him as archbishop of St. Andrews and primate of Scotland, and soon commenced a furious persecution of the reformers, already numerous and increasing. That he might be invested with supreme authority in all matters ecclesiastical, he obtained from the pope the appointment of *legatus a latere* in Scotland, and induced the king to institute a court of inquisition, to inquire after heretics in all parts of the kingdom. To maintain the French influence, and prevent all danger to the Roman Catholic church in Scotland by a friendly connection with England, he contrived to frustrate a proposed meeting of king James with his uncle, Henry VIII., and even prevailed on the former to declare war against his royal relative. On the death of James, after the disastrous overthrow of the Scots at Solway Moss, Dec. 14, 1542, B. produced a forged will of the late king, appointing himself, with three others, regents of the kingdom during the minority of the infant queen Mary. The nobility, however, rejected the fictitious document; and elected the earl of Arran regent, who then professed the reformed faith. The following month, B. was arrested and imprisoned, accused, among other charges, of a design to introduce French troops into Scotland, in order to stop the negotiations then in progress with Henry of England for a marriage between the young prince of Wales, afterwards Edward VI., and the infant queen of Scots. He was soon after liberated, and reconciled to the regent, whom he induced to abandon the English interest, and publicly to abjure the reformed religion. On the young queen's coronation in 1543, B. was again admitted of the council, and appointed chancellor. He now renewed his persecution of the reformers; and, in Jan., 1546, accompanied by the regent, he made a diocesan visitation of the counties under his jurisdiction, and punished with the utmost severity all the Protestants he could find. At Perth, a number of persons, accused of heresy, were banished the city, others were imprisoned; three men were cruelly hanged, and one woman drowned, by his directions. During a provincial council of the clergy held at Edinburgh, at which he presided, he caused the celebrated evangelical preacher, George Wishart, to be apprehended, and conveyed to the castle of St. Andrews, where he was burnt at the stake, B. and other prelates witnessing his sufferings from a window. A conspiracy having been formed against him, at the head of which were Norman Leslie and his brother, B. was assassinated in his own castle of St. Andrews, 29th May, 1546. Though endowed with great talents, B. possessed little learning. He is said, however, to have written *Memoirs of his Own Embassies;* a treatise on *St. Peter's Supremacy;* and *Letters to Several Persons*, of which Dempster observes there are several copies extant in the imperial library at Paris. Haughty, cruel, and intolerant, he was also licentious in the extreme. He had six natural children, three sons and three daughters—the latter married into families of distinction. One of his sons became a Protestant. His death was scarcely lamented by any party in the state.

BEATRI'CE PORTINA'RI, Dante's poetical idol; daughter of a Florentine noble, remarkably graceful and accomplished. Dante first saw her when she was but nine years old, and but seldom afterwards; but in his vivid imagination she grew to be the

personification of divine truth, and so appears in the *Divine Comedy*. In 1287, she married a citizen of Florence.

BEATTIE, JAMES, poet and moral philosopher, was b. 25th Oct., 1735, at Laurencekirk, Kincardineshire, Scotland. He studied at Marischal college, Aberdeen, where he acquired a high reputation as a classical scholar. In 1758, he was appointed one of the masters of the grammar-school in that city, and in 1760, professor of moral philosophy in Marischal college. Ten years afterwards appeared B.'s famous *Essay on Truth*, which met with most extravagant success. It was intended as an antidote to Hume, whose penetrating skepticism had found its way into all the enlightened circles of Scotland, and alarmed the friends of revealed religion. Drs. Reid and Campbell had previously attempted to refute the skepticism of the great historian, but, in the opinion of many, too deferentially. B., whose nature was poetically vehement, and whose zeal was consequently very ardent, assaulted Hume more violently, if not more powerfully, than his predecessors. The author himself naturally shared the popularity of his essay. He was introduced to George III., and solicited by dignitaries of the English church to take orders; high preferments were also promised, which, however, he magnanimously refused, shrinking with delicacy from doing anything which might give his adversaries a chance of saying that he had written on behalf of religion for hire. It was thought for a time that B. had demonstrated "the immutability of truth," and exposed the "sophistry of skepticism;" but if we may judge from the neglect which has overtaken his treatise during the last fifty years, his achievements had been overestimated. B. was deficient in logical acumen and in extent of philosophic erudition, but his poetical fancy, pure enthusiasm, and pious intentions, recommended the essay to multitudes. In 1771, appeared the first part of *The Minstrel*, and in 1774, the second part. It is a delightful poem. Time has dealt gently with it, for it still retains the freshness of its youth. It overflows with a sweet poetic emotion, and is rich in picturesque descriptions, while the versification has a quiet fullness of melody. The author's gentle yet fervent spirit beats in every line. The poem describes "the progress of a poetical genius born in a rude age, from the first dawning of fancy and reason, till that period at which he may be supposed capable of appearing in the world as a minstrel." B. intended to have added a third part, but circumstances hindered him. In 1776, he published a series of essays on *Poetry, Music*, etc.; in 1783, *Dissertations Moral and Critical;* in 1786, *The Evidences of the Christian Religion briefly and plainly stated;* and in 1790–93, *The Elements of Moral Science;* all of which works are written in a clear and elegant style, and with a high appreciation of whatever is beautiful and good. He died Aug. 18, 1803. His life has been written by his friend, sir William Forbes.

BEAUCAIRE, a well-built commercial t. of France, situated on the right bank of the Rhone, in the department of Gard, opposite Tarascon, with which it is connected by a magnificent suspension bridge. Pop. '76, 7956. The harbor is commodious for vessels, which enter it by a canal communicating with the Mediterranean, and avoiding the sand-banks at the mouths of the Rhone. The main feature of B. is its great fair, established, it is said, as early as the 12th century. It is held annually, beginning 22d July, and lasting six days. In former times, when this fair was free from duties, it was attended by merchants and manufacturers from almost all parts of Europe, from the Levant, and even from Persia and Armenia; and as the small town could not contain the vast concourse of traders, thousands of wooden huts and of tents were erected in the neighboring valley. But the numerous imposts demanded since 1632, foreign wars, and the competition of Marseilles, Lyons, and other large places, reduced the traffic of B., which sank still lower in the days of the revolution. The fair, however, is still held in much repute, the number attending it being estimated at 50,000, and the amount of property changing hands at £1,200,000. The chief articles of commerce are silks, wines, oil, almonds, and other fruits, spices, drugs, leather, wool, and cotton. B. appears to have been known in ancient times as Ugernum, which, in the 7th c., was a place of importance in a military point of view.

BEAUCE, a co. in Canada, province of Quebec, on the Maine border; 1100 sq.m.; pop. '71, 27,253; traversed by Chaudiere river. Chief t., St. Joseph.

BEAUCHAMP, ALPHONSE DE, a French historian and publicist, b. at Monaco, 1767; d. in Paris, June 4, 1832. He received his education in Paris, and entered the Sardinian military service. At the outbreak of the war with France, he refused to bear arms against his country, and obtained his discharge; but being suspected of treasonable designs, he was imprisoned for some months. After his liberation, he returned to Paris, where he took part against Robespierre; and on the establishment of the directory, obtained a situation in the office of the minister of police, and had the surveillance of the press. Here he commenced his *Histoire de la Vendée et des Chouans* (3 vols., Par. 1806; 4th ed., 1820), for which Fouché supplied the materials. As this work displeased the emperor, B. was banished to Rheims, but was recalled in 1811, and again received a subordinate appointment (on condition that he should publish nothing concerning his political contemporaries), which he lost in 1814. Under the restoration, he received a pension (1820), and wrote for the *Moniteur*, the *Gazette de France*, and the *Biographie des Hommes Vivants*, edited by Michaud. The numerous historical writings of B. are interesting, but bear the impress of party-spirit; but in his *Histoire du Brésil*

(Par. 1815), and *Histoire de la Conquête du Pérou* (Par. 1807), he found no opportunity of expressing his political partialities. Among his other works may be mentioned the *Histoire de la Campagne de* 1814-15 (2 vols., Par. 1818), the *Histoire de la Révolution du Piemont*, directed against De la Rosa (Par. 1823), and *Vie de Louis XVIII.* (Par. 1825). After the July revolution, he was employed on several legitimist journals; and the supposititious *Mémoires* of Fouché (4 vols., Par. 1828–29) have, with good reason, been ascribed to Beauchamp.

BEAUFORT, an inland district of the w. division of the cape Colony, divided into 9 field-cornetcies. It is chiefly used for pasturage, its oxen being, in seasons of abundant rain, decidedly the fattest in the colony. Its area is about 13,050 sq.m.; and its pop. is nearly 6000. Its capital, of the same name, is on the Gamka, being 363 m. to the e. of Cape Town, and 144 to the w. of Graaffreinet.

BEAUFORT, Cardinal, and bishop of Winchester (b. about 1370), was a natural son of John of Gaunt, duke of Lancaster, and was half-brother to king Henry IV. He was educated in England and Germany, and in 1404 became bishop of Winchester. He repeatedly filled the office of lord chancellor, and was involved in all the most important political movements of his times. He was present at the council of Constance, and voted for the election of pope Martin V., by whom he was subsequently made a cardinal. When the cardinal's nephew, Henry V. of England, proposed to levy a new impost on the clergy, in order to raise money for carrying on the war against France, B. was the chief opponent of the measure; but nevertheless he lent the monarch, out of his own private purse, £28,000—an almost incredibly large sum in those days, and one which justifies the belief that he was the wealthiest subject of his time in all England. His service in this affair was soon recognized by the pope, who sent him as legate into Germany, there to organize a crusade against the followers of John Huss. This undertaking failed; and the cardinal, having expended, in levying an English army against France, the moneys granted from Rome for other purposes, now fell under papal displeasure. In 1431, B. conducted the young king, Henry VI., to France, to be crowned in Paris as king of France and England. Here he also endeavored, but vainly, to reconcile the duke of Bedford, regent of France, with the offended duke of Burgundy. Cardinal B. died at Winchester in 1447. His memory is stained by his suspected participation in the murder of his great political rival, the duke of Gloucester, who headed the lay opposition to the despotism of ecclesiastical statesmen; and by the fact that he presided over the tribunal which sentenced the maid of Orleans to perish at the stake.

BEAUFORT, a co. in e. North Carolina, on Pamlico river and sound; 1000 sq.m.; pop. '80, 17,471—7,362 colored. It has a level, sandy, and marshy surface; products, tar, turpentine, corn, sweet potatoes, rice, etc. Co. seat, Washington.

BEAUFORT, a co. in s.e. South Carolina, on the sea-coast and the Savannah river; 1540 sq.m.; pop. '80, 30,190—27,752 colored. Productions, corn, rice, sweet potatoes, and Sea island cotton. Co. seat, Beaufort.

BEAUFORT, a t. and port of entry, the seat of justice of Carteret co., N. C., at the mouth of Newport river, 11 m. n.w. of cape Lookout; reached by the Atlantic and North Carolina railroad; pop. '70, 2340—1243 colored. There is a good harbor, the entrance to which is protected by fort Macon. The principal trade is in tar and turpentine.

BEAUFORT, a t. and port of entry in Beaufort co., S. C., on Port Royal island and Broad river, 14 m. from the ocean; pop. '80, 2,549—1273 colored. It is at the terminus of the Port Royal railroad; it has a good harbor, and is a popular summer resort.

BEAUFORT, Sir FRANCIS, 1774–1857. He served in the British navy, and was in the fight off Brest in 1794; commodore in 1800, and wounded in the fight near Malaga. He traveled in the east, and wrote a description of his route; in 1812, was wounded in a conflict with Turkish pirates, and returned to England; became rear-admiral in 1846. He contributed much to the science of geography, hydrography, etc., and was a member of most of the English learned societies.

BEAUFORT, FRANÇOIS DE VENDÔME, Duc de, 1616-69; grandson of Henry IV. of France; served in the thirty years' war; conspired with Cinq-Mars against Richelieu, and fled for safety. Under Louis XIV. he was in a conspiracy against Mazarin, and was imprisoned. He escaped in 1648, became a leader of the frondeurs, and was called by the Parisian populace "king of the markets." He killed the duke of Nemours, his brother-in-law, in a duel; afterwards made his peace with the court, and was appointed to command the navy. In 1664, he defeated the African corsairs; in 1666, led the fleet which was to aid the Dutch against England; in 1669, he assisted the Venetians, who were besieged by the Turks in Candia, and was there killed in a sally.

BEAUFORT, MARGARET, 1441–1509; countess of Richmond and Derby, daughter of the duke of Somerset, wife of the earl of Richmond (half-brother of Henry VI.) and by him mother of Henry VII. of England. She was afterwards wife of Sir Henry Stafford, and of Thomas, lord Stanley. She endowed Christ's and St. John's colleges in Cam-

bridge, establishing a divinity school in each, but Henry VIII. recovered the property as her heir. She translated some devout works from the French.

BEAUGENCY, an ancient t. of France, in the department Loiret, and situated on the right bank of the Loire, 15 m. s.w. of Orleans. B. was at one time surrounded by walls, flanked with towers and bastions, and defended by a strong castle, now ruined. In the history of the wars of France, B. occupies a conspicuous place. It was successively in the hands of the Huns, Saxons, Normans, and English, but it sustained most damage during the religious wars of the 16th century. B. manufactures woolens, leather, etc., and has a trade in wine, wool, and corn. Pop. '76, 3901.

BEAUHARNAIS, ALEXANDRE, Vicomte de, b. 1760, in the island of Martinique, served, under Marshal Rochambeau, in the American war of independence. Afterwards, he went to France, but though well received by the French court, he embraced the popular cause. Elected deputy to the states-general by the nobility and the justiciary authorities of Blois, he was among the first of his order to fraternize with the *Tiers Etat*, or democratic party. On the night of Aug. 4, 1789, he voted for the abolition of all privileges, and the political equality of all citizens. As a reward for his constancy to the cause of liberty, he was named secretary of the national assembly, and subsequently member of the military committee, but lost his popularity considerably by venturing to praise and defend the conduct of gen. Bouillé in the sanguinary suppression of the insurrection at Nancy. The manner in which he received the news of the flight of Louis XVI. exhibits a curious mixture of contempt and dignity. "Gentlemen," said he to the assembly over which he presided, "the king has just gone off; let us pass to the order of the day." In 1793, he declined the office of minister at war, and tendered his resignation as gen. of the army of the Rhine, because it had been determined to exclude the nobility from the service. During the reign of terror, his enemies revived the report that he had participated in the surrender of Mentz, because he had remained idle with his troops for 15 days. In consequence of this accusation, he was called from his country residence at Ferté Imbault to Paris, where he was tried and sentenced to death by the revolutionary tribunal. He submitted to his fate with firmness, and died on the scaffold, July 23, 1794, aged 34 years. His widow, Josephine, married Napoleon Bonaparte, who adopted Eugène and Hortensia, son and daughter of Beauharnais. Hortensia was married to Louis Bonaparte, king of Holland, and became the mother of the late emperor of the French.

BEAUHARNAIS, EUGÈNE DE, Viceroy of Italy during the reign of Napoleon I., and afterwards duke of Leuchtenberg, and prince of Eichstadt, was b. Sept. 3, 1781, and was the son of the viscount Beauharnais. After his mother's marriage with Bonaparte, he accompanied him in his campaigns in Italy, and in the expedition to Egypt. He rapidly rose to the highest military rank; and in 1805, after the erection of the imperial throne, he was made a prince of France and viceroy of Italy. In 1806, he married the princess Amalie Augusta of Bavaria, and not long afterwards was created prince of Venice, and declared by Napoleon his adoptive son, and heir of the kingdom of Italy. Although his political power was much limited, he conducted himself in Italy with much prudence, energy, and moderation, and in all the various scenes of his life maintained an honorable and virtuous character. It is to be regretted, however, that he considered himself so entirely a vassal of Napoleon, and bound to carry out the often harsh decrees of the latter in regard to Italy. His military talents were great, and were displayed particularly in the Italian campaigns, in the wars against Austria, and in the retreat from Moscow, in which the preservation of the French army from total destruction was very much to be ascribed to the skill and resolution of the viceroy and of Ney. The victory of Lützen was decided by his conduct in that battle. Napoleon sent him from Dresden to Italy, which he ably defended, even after Austria had joined the coalition, and Murat had deserted the cause of the French empire. After the fall of Napoleon, he entered into a convention with count Bellegarde. In the affairs of the Hundred Days, he took no part; and in the treaty of Fontainebleau and congress of Vienna, he was allowed to retain his possessions in the March of Ancona; and large sums were granted to him in compensation for his other Italian possessions, with which he purchased from his father-in-law the landgraviate of Leuchtenberg and principality of Eichstadt, and took his place as duke of Leuchtenberg among the nobles of Bavaria. He d. at Munich on the 21st of Feb., 1824.—His eldest son, Charles Augustus Napoleon, duke of Leuchtenberg, married the queen Donna Maria of Portugal on the 25th of Jan., 1835, but d. on the 25th of Mar. in the same year.—Another son, Max Eugène Joseph Napoleon, who succeeded his brother as duke of Leuchtenberg, married the grand duchess Maria Nikolajewna, a daughter of the emperor Nicholas of Russia; and his children bear the name of Romanowski, and are ranked among the members of the Russian imperial family. He d. 1st Nov., 1852, of disease of the lungs, consequent upon a scientific tour in the Ural. He was a zealous mineralogist, and left large collections, which are preserved at St. Petersburg.

BEAUHARNAIS, HORTENSE EUGÉNIE. See BONAPARTE, *ante*.

BEAUHARNOIS, a co. in the province of Quebec, Canada, on the St. Lawrence, and including Grand island; 200 sq. m.; pop. '71, 14,759. Chief town, Beauharnois, 18 m. s.w. of Montreal.

BEAUMANOIR, PHILIPPE DE, d. 1296; a French writer on law. In 1273, he was *bailli* at Senlis, and in 1280 held a similar office at Clermont. His chief work, *Coutumes de Beauvoisis* is highly commended by Montesquieu.

BEAUMARCHAIS, PIERRE AUGUSTIN CARON DE, a French poet, b. in Paris, Jan. 24, 1732, d. May 17, 1799, was the son of a watchmaker, and was brought up to his father's trade. He soon displayed a remarkable taste for music, attained proficiency as a player on the harp and the guitar, and was appointed music-master to the daughters of Louis XV. This was the beginning of his course of good-fortune. He acquired considerable property by marriage, and to dignify the somewhat ambiguous position in which his calling placed him, he devoted his talents to literature. His first play, *Eugenie* (1767), was successful, and was followed by *Les Deux Amis* (1770). Having become involved in lawsuits with Lablache and Götzman, he revenged himself on the latter—who was a member of the so-called *Parlament Maupeou*—by publishing his famous *Mémoires* (Paris, 1774), which united the bitterest satire with the sharpest logic, and gained for him a reputation that made even Voltaire uneasy, who could not bear a rival in his own department. Despite his wit, however, he lost his suit. His fame now rests on his two comedies, *Le Barbier de Seville* (1775), and *Le Mariage de Figaro*. Of his later works, we may mention *Mes Six Epoques*, in which he describes the perils through which he had passed in the first period of the revolution. During the American war of independence, he entered into a speculation for supplying arms, etc., by which he realized a considerable profit, but was a great loser by his expensive edition of Voltaire's works, and other speculations. The desire of gain and love of distinction were the leading motives which actuated B. His literary merits have been differently estimated. The most judicious critic of his writings and character is M. de Loménie, whose *B. and his Times* is full of interesting literary anecdote. An edition of B. was published at Paris in 1809.

BEAUMA'RIS, a seaport and chief t. of Anglesea, North Wales, is situated on the w. side of the picturesque bay of B., near the n. entrance to the Menai strait, 3 m. n. of Bangor, and 239 m. n.w. of London. B. has the ivy-covered remains of a castle, erected by Edward I., and a free grammar-school, and is a favorite sea-bathing resort. The bay is a safe anchorage in stormy weather. B. unites with Amlwch, Holyhead, and Llangefin in sending one member to parliament. It exports copper and other ores, slates, marble, etc. Pop. '71, 2291. The vessels which entered this port in 1875 numbered 2209, of tonnage 528,447; which cleared it, 2060, of 477,490 tons.

BEAUMONT, a t. in the department of Ardennes, France, on the Meuse, 10 m. s.e. of Sedan; pop, estimated, 1400. In the neighborhood, Aug. 30, 1870, the French under Marshal MacMahon were defeated by the Germans under the crown prince of Saxony, who gained by the battle such advantages as compelled the immediate surrender of Sedan.

BEAUMONT, FRANCIS, poet and dramatist; **FLETCHER,** JOHN, poet and dramatist. These writers were so closely associated in their lives and labors, that their names have become indissolubly united.—Francis Beaumont, the third son of sir Francis Beaumont, one of the justices of the common pleas, was b. at Gracedieu, in Leicestershire, in 1586, ten years after Fletcher; and d. in 1615, ten years before him. When 10 years of age, he became a gentleman-commoner of Broadgate hall (now Pembroke hall), and in 1600 was admitted a member of the Inner Temple. Two years thereafter, he published certain translations from Ovid. When about 19 years of age, he became the friend of Ben Jonson, and wrote commendatory verses to some of his dramas. At the theater, which attracted to its service most of the intellect and wit of the time, he became acquainted with Fletcher, and drawn together, they lived in the same house till B.'s marriage in 1613. He married Ursula, daughter and coheir of Henry Isley of Sundridge in Kent, by whom he had two daughters. He died at the early age of 30, and was interred in Westminster abbey. Poetry seems to have run in the blood of the Beaumonts. Several members of B.'s immediate family wrote verses, and the elder brother of the dramatist, sir John Beaumont, is said by the critics to have much improved our rhyme couplet.

John Fletcher was b. in 1576. His father was a clergyman, and appears to have inherited many of the honors of the church. He was for some time incumbent of Rye, in Sussex; thereafter, he was appointed dean of Peterborough, and is said to have attended queen Mary on the scaffold, and to have embittered her last hours with irrelevant exhortation. On his elevation to the see of London, he married a second time, and thereby procured the disfavor of the virgin queen. He died shortly after—of a queen's frown, as some maintain; others say, of the immoderate use of tobacco. John F. entered Bennet college, Cambridge, on the 15th Oct., 1591, where he acquired some reputation for classical erudition. It is uncertain how long he remained at the university, or whether he took a degree. The *Woman-hater*, produced in 1606-07, is the earliest play of his which is known to exist. It is not known precisely in what circumstances F. passed his life. He asserts his independence in some verses introductory to *The Faithful Shepherdess*, published about 1610, yet he wrote more rapidly than most men then writing for bread. The last four years of his life produced eleven new plays—a swiftness surpassing that of Shakespeare himself. Tarrying in London, it is said, for a

suit of new clothes, he caught the plague, and died. His death occurred in 1625, and he was buried in the church of St. Saviour's. F. also could boast of poetic descent and connection. Dr. Giles Fletcher, the bishop's younger brother, has been called "an excellent poet;" and two sons of his, Giles and Phineas, distinguished themselves by their verses. The one wrote *Christ's Victory and Triumph;* the other, *The Purple Island.*

The works of B. and F. comprise in all 52 plays, a masque, and several minor poems; but it is difficult to allocate, in any satisfactory manner, the authorship of these. F., being the longer lived and more prolific writer, of course contributed the largest share. Rowley assisted F. in *The Maid of the Mill.* Some critics think that the hand of Shakespeare may be detected in *The Two Noble Kinsmen,* and not without some show of reason. There is a tone of music and a step of thunder in some of the passages to which no parallel could be found in any of the companion-dramas. Two plays left unfinished at F.'s death were completed by Shirley. Out of the 52 plays, B. is supposed to have had a share in the composition of 17, and only 3 out of that small number were, during F.'s lifetime, published as joint productions. Two of these—*Philaster* and *The Maid's Tragedy*—are, with the exception of the great passages in *The Two Noble Kinsmen,* the glory of the collection. The question has been often discussed, why these plays are called by the name of B. and F., thus giving precedence to the younger and less voluminous writer. Mr. Dyce thinks, that of the three plays published as joint productions during F.'s life, B. had either the greater share, or that, through feelings of natural courtesy, F. placed the name of his deceased associate before his own, and that future editors naturally followed the arrangement which they found to their hand. Mr. Darling is inclined to give no reason at all, and ascribes the whole thing to accident. From all that can be gathered, it would appear that B. possessed the deeper and more thoughtful genius; F., the gayer and more idyllic. There is a strength as of granite rock in *The Maid's Tragedy;* there is a glad exuberant music, and a May-morning light and freshness in *The Faithful Shepherdess,* which Milton did not disdain to accept as a model in the lyrical portions of *Comus,* and of which the *Endymion* of Keats is but an echo. In these plays, B. and F. are the cleverest, gayest gentlemen. They never sound the deep sea of passion; they disport themselves, dolphin-like, on its surface. They have no power of serious characterization, and their numerous creations are seldom consistent; but they say the most clever, pleasant, and glancing things. Morally, little can be said in their praise. No audience of the present day could sit out the representation of their purest plays. Some of the impurest are almost beyond conception, yet there is always an air of good-breeding about them, and the filth is handled in the most gentlemanly manner. It was a great intellectual period in which B. and F. lived; but Shakespeare stands above them and the rest of that dramatic brotherhood like Mont Blanc above the summits of the lower Alps—conspicuous not only from his altitude, but from his purity.

BEAUMONT, GUSTAVE DE, a distinguished French publicist, b Feb. 6, 1802, at Beaumont-la-Chartre, in the department of Sarthe. He studied law, and was made procurator-substitute in the superior tribunal of the Seine, but lost this office after the July revolution. In 1831, B. and Tocqueville were commissioned by the French government to study the prison discipline of America. When B. returned to Paris, he received a place under government, but was soon deposed, as he refused to conduct the prosecution in the scandalous process against the Baroness de Feuchères. In 1840, he was elected deputy for the department Sarthe, and distinguished himself, as a member of the opposition, by his information and readiness on all political questions. After the Feb. revolution, 1848, he was returned as a member of the legislative assembly, and here maintained the character of a sincere but moderate republican. After the 2d Dec., 1851, he was arrested and imprisoned for some time in the fortress of mont Valérien. After regaining his liberty he lived in retirement, until his death in 1866. B. was the grandson of Lafayette, and in 1836 married his cousin, the daughter of Georges Lafayette. The writings on which B 's reputation is founded are *Note sur le Système Pénitentiare* (1831); *Du Système Pénitentiare ux Etats-Unis, et de son Application en France* (2 vols., 1832; partly by Tocqueville); *Marie, ou l'Esclavage aux Etats-Unis* (2 vols., 1835); and *L'Irlande, Sociale, Politique, et Religieuse* (2 vols., 1839).—BEAUMONT-VASSY, EDOUARD VICOMTE DE, a relation of the former, has acquired a reputation as the writer of *Une Marquise d'autrefois* (1838), and other romances, and some historical works, especially a *History of the European States since the Congress of Vienna* (vols. 1 to 6, Par. 1843–1853).

BEAUMONT (ELIE DE), JEAN BAPTISTE, late chief engineer and professor of geology in the school of mines at Paris, and in the *Collége de France,* was b. at Canon in 1798. He was distinguished not merely as a practical geological investigator, but also as a clear and acute speculator. The prevailing theory regarding the elevation of mountain systems was elaborated chiefly by him. His views as to the separate periods of elevation were published in several treatises. He was occupied for 23 years, in conjunction with Dufrénoy, in the preparation of a geological map of France, and its accompanying text. Among his writings are: *Coup d'Œil sur les Mines,* 1824; *Observations Géologiques sur les Différentes Formations dans le Système des Vosges,* 1829; *Recherches sur quelques-unes des Révolutions de la Surface du Globe,* 1835; and *Voyage Métallurgique en Angleterre* (2d ed., 1837–39). He died in 1874.

BEAUMONT, WILLIAM, 1796-1853; b. Conn.; a surgeon in the U. S. army, noted for discoveries in the processes and laws of digestion, made in watching the operations of the stomach in the case of Alexis St. Martin. On the 6th of June, 1822, St. Martin, then supposed to be 18 years old, while at Mackinac, Mich., was accidentally shot, receiving the entire charge of the musket in his left side, the muzzle of the gun being about three feet from his body. The discharge tore away portions of his clothing, fractured two of his ribs, lacerated his lungs, and lodged in his stomach. Dr. B., who was then stationed at Mackinac, restored St. Martin to good health within a year, renewing his former strength and spirits, though the aperture made by the shot was never closed. Two or three years afterwards, Dr. B. commenced a series of experiments upon the stomach of the *voyageur*, studying its operations and secretions, the action of the gastric juice, etc. These experiments he continued from time to time, his patient presenting the spectacle of a man enjoying good health, appetite, and spirits, with an opening in his stomach, through which the action of that organ could be satisfactorily noted from the exterior. Dr. B. was the first individual who obtained the gastric juice from a living human being, and he has demonstrated, beyond a doubt, its chemical properties and digestive powers. He published the result of his experiments in 1833. St. Martin was still living in Dec., 1879.

BEAUMONT DE LA BONNIÈRE, GUSTAVE AUGUSTE DE, 1802-66; a French advocate who in 1831 came to the United States with De Tocqueville to examine our penitentiary system, and with him published a book on the subject. Beaumont de la Bonnière also wrote *Marie, or Slavery in the United States*, a novel; and in 1839, *Ireland, Political, Social, and Religious*. In 1840, he was chosen to the chamber of deputies; in the constituent assembly of 1848 he was a member of the committee of foreign affairs, and Cavaignac sent him as minister to England. After 1851 he retired from politics. His wife was a granddaughter of Lafayette.

BEAUNE, capital of an arrondissement in the French department Côte d'Or, formerly included in the duchy of Burgundy, is situated in a pleasant district on the river Bouzeoise, about 23 m. s.s.w. of Dijon. The town is well built; has a fine parish church, Notre Dame, founded in 976 by duke Henri of Burgundy; and a splendid hospital, founded in 1443 by Nicholas Rollin, chancellor of Philip, duke of Burgundy. There are manufactories of serges, woolen cloth, and cutlery. A considerable trade is carried on in Burgundy and Champagne wines. B. gives its name to one of the best of the Burgundy wines. Pop. '76, 10,696.

BEAUNE, FLORIMOND, a distinguished mathematician, and friend of Descartes, was b. in 1601, at Blois, in France, where he d. in 1652. His labors and discoveries contributed greatly to the improvement of the modern analytical geometry first introduced by Descartes. Algebra was also enriched by B.'s showing that, in equations to the fourth degree, the limits of positive roots might be found from the coefficients. B. may be regarded as the proper founder of the integral calculus, as he first endeavored to deduce the nature of curved lines from the properties of their tangents. The so-called "Beaune's Problem" (which has been completely solved only by Jean Bernouilli), still given in the integral calculus, was for his time new and remarkable: it turns also on the determination of the nature of a curved line from a property of its tangent. The only work of his we possess is *De Æquationum Limitibus Opuscula duo, et Note Breves*.
